GALWAY, Saratoga Co.—As a general thing the harvest in this part of the county is good. Winter wheat was never better. A larger area than usual sown. Spring wheat is but little known. Corn is fine. Hay is an average crop. Oats good Rye middling. Fruit an average. Potatoes better than we have seen in several years. Potatoes $1 per barrel; oats, 50c per bushel; corn, 60c; rye, 75c; wheat, $1.50 per bushel hay, $15 per ton. A. H.

GUILFORD, Chenango Co.—The present prospects for the dairy farmer in this locality are anything but flattering. An open winter followed by a dry May and June, has reduced the hay crop about one-fourth. However, there was a large quantity of hay summered over, which will prevent many farmers from sacrificing their dairies. Corn, oats, potatoes, spring wheat and apples promise abundant crops. M. E. M.

LAKE VIEW, Erie Co.—Winter wheat is filling finely (Clawson and Red Chaff). Acreage 25 per cent. more than last year. Spring wheat (not much raised) is looking well. Winter rye is filling well, (not much grown—no Spring). Corn backward (mostly 8-rowed, yellow and white); about same acreage as last year. Potatoes are looking well (Early Rose, Peachblow and Peerless); bugs working, but not so much as last year. Oats and barley are looking fine, (white and black oats, four-rowed barley); acreage, 10 per cent. more. Some Amber cane was raised last year. The sirup was good. No attempt was made at sugar-making—there will be some trials this year. There are only a few pieces of cane; it grows as well as corn. Apples promise well (Baldwin, Greening, Russet, Red Astrachan). Cherries and plums fair crops, but somewhat stung. Pears are uneven—some orchards promising well, in others few or none. Grass crops improved by late rains but not heavy; yield below average. E. W. S.

MEDINA, Orleans Co.—Crops of all kinds in this section never looked better. Of wheat Clawson is our main crop; acreage, 20 per cent. more than last year, and the prospect is favorable for a large yield. Our barley is the four and two-rowed. The acreage under it is half that of wheat. No rye sown in this section. Oats, acreage half that of barley; a large yield is anticipated. Of potatoes Early and Late Rose are the most used. They are looking well, but are covered with bugs; acreage about that of last year. Snow-flake seems to be talked of as the coming potato. The acreage under beans is about that of barley. Kinds sown, Medium Pea, Marrow, and Navy. Drought is pinching them somewhat, but there is a prospect of a fair yield. Corn looks well—large for the time of year. I have two acres of Blount's that seem to do nothing but grow day and night, cold or hot, wet or dry. W. H. C.

NAPLES, Ontario Co.—Wheat, corn, potatoes oats, rye, and barley will all be above an average. No sorghum grown. Fruit will be less than an average. The dry weather in May has spoiled the hay. There will be about one-third of a crop. Grapes, apples, peaches and strawberries are the fruits mostly grown. E. A. H.

PALMYRA, Wayne Co.—Taking 100 as the standard of crops last year, this year's harvest will compare as follows with its predecessors: Wheat acreage 125; yield, 150; potatoes, acreage 100; yield, 100; oats, acreage 100; yield, 100; barley, acreage 100; yield, 125; corn, acreage 100; looks fine; sorghum, none raised. Most of the wheat is Clawson; and of the potatoes, Early Rose and Snowflake, while the oats are the white sort and the barley the two-rowed. Apples set very full but the trees are badly twig-blighted. R. I. Greening, Baldwin and Twenty Ounce generally produce the best here. The King and the Twenty Ounce Pippin are shy bearers. We have had seasonable showers all the season. G. P.

PERRY CENTER, Wyoming Co.—Corn, potatoes and oats are the same as last year, both in acreage and yield; wheat has increased 25 per cent. in acreage and will yield 50 per cent. more than last year. Barley is doing well, mostly two-rowed. Very little rye and no sorghum is raised. Early Rose and Snowflake are our favorite potatoes. Apple trees set very full, but they are now badly twig-blighted. R. I. Greening, Baldwin and Twenty Ounce produce best. We have had reasonable showers all Summer. G. P.

SCHENEVUS, Otsego Co.—Crops in this section are looking good generally, except hay, which will be light. Rye, oats and potatoes are looking well. Corn, fair. Apples will be plentiful. J. F. C.

SCOTIA, Schenectady Co.—We were favored with plenty of rain until about two weeks ago; since then it has been intensely warm and dry. Rye is very fair, except on clay land, and is nearly ripe. Oats are in want of rain very much. Corn is not growing as it ought, for want of rain. The Rose bugs are doing considerable damage to fruit in this section. The potato bugs are quite plentiful now as the young slugs are just beginning to come on. Hay is a light crop, except on low lands, where there has been plenty of moisture. New seeding is looking as well as can be expected for the dry weather we are having. E. E. H.

SOUTH GILBOA, Schoharie Co.—Grass is light. Barley and oats are good. Corn, good. Potatoes, fair—acreage as usual. Wheat and rye are ordinary crops. Mangel-wurzels and sugar beets look well. Apples are sparse and plums a good crop. The ground is dry. Farmers have finished sowing buckwheat. Acreage as usual. J. O. C.

WHITNEY'S POINT, Broome Co.—The season, thus far, has been very dry. Wheat was badly winter-killed, but it is looking well now. Corn, too, is looking well, although small yet; with rain it would grow fast. Potatoes are looking fine, and are, in fact, the most promising crop on the list. The present dry weather is hurting oats, making them look yellow and sickly. Hay, the main crop of this section, will be one-third below the average. Fruits and berries of all kinds promise well. M. B. D.

New Jersey.

MANALAPAN, Monmouth Co.—Owing to the drought corn is very backward. Some fields that were entirely replanted can scarcely make a crop, unless frost comes very late; acreage about as formerly. Potatoes will be small and few, unless we have rain soon; mostly early varieties were planted. Beetles are plentiful; but they have done no particular damage. Clover hay is less than half a crop, and Timothy less than one-third. some fields being scarcely worth cutting. Rye straw is good, but the heads are not well filled. Wheat is short, but well filled, and will make an average crop, more having being sown than usual. Oats are very short, and will, no doubt, be a light crop. Apples are plentiful. Pears and peaches are rather scarce, not many of the latter being raised. These are our main crops. Everything is suffering for rain. W. H. D'B.

Pennsylvania.

CAMBRIDGEBORO, Crawford Co. — Harvest of wheat extra-good; acreage about the average. Kinds grown are Fultz, Lancaster, Mich. White, Red Mediterranean. Lancaster and Fultz are the most successful. Corn is backward owing to drought in May. An average acreage. Common yellow and smaller varieties are grown. Potatoes are good; an average acreage. Varieties Early and Late Rose, Snowflake and Compton's Surprise. Snowflakes are considered No. 1 for Winter and Spring. Oats are good; acreage a little above average; nearly all the white varieties are grown. scarcely any black ones. Rye, scarcely any sown. Barley, none grown. Apples will make a middling crop. Peaches, the same. Pears and cherries were mostly killed by frost. Plums have been destroyed by curculio. Of apples the most successful varieties are Red Astrachan, Seek-No-Further, Rambo, R. I. Greening, Northern Spy, Winesap, etc. No sorghum in this vicinity. G. L.

GRANT, Indiana Co.—This has been for many years a lumbering community, and we are only beginning now to raise enough farm products for home use. Wheat is now ready for harvesting and is called a very good crop—acreage 10 to 15 per cent. larger than last year; principal variety, Fultz. Corn, potatoes, oats and rye are all good. The potato beetle is somewhat troublesome. Acreage somewhat larger than last year. No barley or sorghum is grown here. The fruit crop will be small, as compared with last year. Of apples our most successful varieties are: Northern Spy, Baldwin, Vandervere, Hoopes, Bellflower and Rambo. E. B. C.

LINEVILLE STATION, Crawford Co.—The wheat harvest promises to be exceedingly good—above the average. Corn, oats and potatoes promise to be average crops, if not more. Rye and barley are not raised here to any extent. The varieties of wheat raised are principally Fultz, Clawson and Lancaster, in the order named. The potatoes raised are mostly Early Rose, Peachblow, and Snowflake, and a few Monarchs. The corn is principally Dent or Gourd Seed and eight-rowed yellow. The grass crop is very light. The grasses most extensively grown are Timothy and clover. Farmers are experimenting somewhat in Orchard grass, and it is proving very successful. No sorghum has been raised here yet, but a little is planted. The acreage under each crop is about the same as usual. S. H. R.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JULY 10, 1880.

WHAT WILL THE HARVEST BE?

In this issue of the Rural New-Yorker practical farmers from every part of the country declare that, on the whole, the present harvest will be extraordinarily good. Here and there, it is true, shortages or even failures of one crop or another occur, but even in these sections other crops are excellent, while the outlook for the country as a whole is emphatically good for nearly every crop except hay, which nearly everywhere has been rendered very short by the killing of clover last Winter and the severe drought during the past Spring and Summer.

Although Winter wheat was seriously injured or entirely killed by the past open Winter throughout nearly the whole of the broad belt intermediate between the acknowledged Winter and Spring wheat regions, yet the favorable weather in early Summer greatly helped what survived, while much of the land on which the Fall-sown wheat had perished was re-sown to Spring wheat, and on this account among others, an unusually large area, especially in the Northwest, was sown to this sort. Owing to the increased acreage under both Winter and Spring wheats, and the fine condition of both crops as a whole, there is now no doubt but that last year's aggregate product of nearly 450,000,000 bushels will be considerably exceeded this year, while the quality of the grain from present indications will be better.

The largely increased acreage under corn this year, especially in the border States, and its fine condition throughout nearly the whole country, leave no doubt that the enormous aggregate prodnotion of about 1,400,000,000 bushels in '79, will be surpassed in '80. It speaks well for the general prosperity of the country that, according to almost all our reports, this peculiarly American product promises to be an exceptionally fine crop everywhere, even where it failed last year, as in Texas, or where wheat and several other crops are very short this year, as in Western Arkansas, Kansas, and Nebraska. Besides serving as a convenient substitute as human food for the other cereals that are short in our Western and Southwestern frontier settlements, the vast yield of corn will also advantageously supplement our scanty hay crop as food for stock.

The yield of oats this year will be unusually heavy and the acreage considerably larger than last year in the Southern, Western and Pacific States, though there is probably little or no increase in the area under it in the Atlantic and Middle States. According to the statistics of '78, the latest at hand, the total product that year was 413,000,000 bushels, and as the aggregate yield yearly increases, it will probably not fall far short of 450,000,000 this year, to which Illinois, Pennsylvania, New York, Ohio, Iowa, and Wisconsin will be the chief contributors, probably in this order.

Barley is generally reported a good crop wherever grown, and as it is well adapted to all sorts of climate and thrives well on land on which wheat would prove a poor crop, no grain is so widely distributed throughout the world or more generally used. In this country less attention is paid to this cereal than in Europe, yet in '78 the total product was 42,000,000, bushels, of which California contributed 4,350,000, double the amount of the previous year, while in the other large producing States, New York, Wisconsin and Illinois, there was a large decrease in acreage. This year, too, it is most likely that whatever increase in area there may be under this crop will be chiefly in the trans-Mississippi States, though the yield is reported good everywhere.

Of rye there was an aggregate production of 25,842,790 bushels in '78, and this will doubtless be considerably exceeded this year, as both the area and yield are reported large, especially in New England to whose poor soils this crop is well adapted, as it thrives well on light, sandy land on which wheat, or even barley, would fail. Owing to the shortage in hay, it is probable that a large area will be sown to rye for foddering purposes, for which it is excellent both in late Autumn and early Spring. Pennsylvania, New York, Wisconsin, Indiana, and Kansas have each hitherto contributed. in this order, more than double as much as any other State to the aggregate of this crop.

Potatoes throughout nearly the entire country are a fine crop. The acreage in the older-settled States is perhaps hardly so great as last year, but the yield seems to be greater, and it is highly probable that they will prove comparatively one of the most profitable crops this year. It is a trifle early yet, however, to form a decided opinion with regard to the yield, as the Colorado beetles are unusually numerous nearly all over the country, and considerable labor will be needed to realize the present excellent promises of the crop.

Of fruits, apples promise to be far away the most abundant, although, as a rule, there will not be the excess which often occurs in the "bearing" year. The drought seems to be the chief foe of apples this year, as reports from nearly all quarters tell of their dropping off heavily from that cause. Pears are an unusually light crop, and the complaints about a shortage in peaches appear to be at least partly verified this year, except in Michigan, whence reports of the crop are almost unanimously good. Grapes are a fine crop on the whole, and so are small fruits, though the latter seem to have suffered from the dry weather considerably more than the former, particularly in New Jersey.

The hay crop—among the most valuable of all—is very short nearly all over the country, and prices of hay the coming Winter are sure to be high in nearly every section. The shortage is especially great in the Middle States, for although the crop will be considerably below the average in New England and the Northwest, yet reports from both these sections give hopes of a moderate crop, while those from nearly all parts of the Middle States give no such consolation. Unless substitutes or supplements are liberally provided, stock will be sure to suffer and likely to sell low the coming Winter.

In New England but little corn and less wheat is grown, although there is a slight increase in the area under both the present year, and both promise a pretty fair yield. Oats, rye, and barley, all three are good crops, as are potatoes, apples and grapes; while pears, peaches and small fruits generally are reported inferior crops. Potatoes seem to be especially good in Vermont and Maine, and apples in Massachusetts and Connecticut.

Hay excepted, all field crops, are, on the whole, fine in the Empire State. The reports of rye, oats and barley are almost universally favorable, while those of wheat and corn are generally encouraging, although the outlook is darker in a few places than throughout the State generally. Apples will be abundant, peaches a moderate crop, pears a poor one. In New Jersey the late extremely dry spell and that in May seem to have been peculiarly disastrous, as the reports from that State are almost as unfavorable as those from Western Kansas. Wheat and grapes, however, seem to have suffered less than other crops and hay more. Pennsylvania appears blessed with abundant crops of all kinds this year, the reports about wheat, oats, potatoes, apples and grapes being especially favorable and those regarding hay the most discouraging. Of all the States in the Union, Ohio at present seems to be the happiest in her harvest, all field crops, except, of course, hay, being splendid both in quantity and quality. The wheat harvest, however, has been interrupted by heavy rains, which may injure the grain in the shocks and lay that standing. Apples and grapes are good crops, peaches a moderate one, and even pears seem better than in most other States.

In Michigan corn and wheat seem to be an average, avoiding both extremes, while the reports concerning oats, rye and barley are unusually good. Potatoes, too, are reported fine, and the accounts of the hay crop are the most favorable that have reached us. Michigan may well be proud of her fruits. judging by the almost uniformly favorable accounts given elsewhere of her apples, peaches, grapes, small fruits, and even pears. Like most of the Northwestern States, she seems to have escaped, at least partially, the extreme drought that has scorched the rest of the country. Northern Indiana appears to have shared her good fortune in this respect, and the crop reports from nearly all over that State are remarkably favorable, except those about apples and peaches, which seem to be poor crops in several places. Illinois also rejoices in an excellent harvest, present or prospective, reports concerning corn, oats, rye, potatoes, grapes, small fruits and pears being particularly good. In the central and southern part of the State the wheat crop, too, is notably excellent, but in the northern portion a good deal of the Winter sort was winter-killed, and much of the replowed land appears to have been devoted to other crops. From Wisconsin crop reports are good, with few exceptions, while those with regard to oats, rye and barley are uniformly favorable. Corn, wheat and potatoes, too, are promising, while hay is better than in any of the Middle States.

From beyond the Mississippi, Minnesota reports a wheat crop unusually large both in area and yield and of excellent quality. Oats, barley and potatoes, too, are highly promising and corn is a large and fine crop. Iowa follows with a splendid corn crop, good ones of oats, potatoes and fruits, and inferior ones of wheat and hay, the Fall-sown wheat having been mostly winter-killed, while the area under Spring wheat seems to be less than usual. Kansas's splendid promise in the Spring of more than 30,000,000 bushels of wheat has been nullified by the severe drought, which has been especially disastrous along the western portion of the State. The corn crop, however—the main crop for sustenance and stock feed—is at present highly promising, and the comparatively new crops of Rice corn and Castor beans are unanimously reported good. Nebraska appears to be nearly as severe a sufferer as her sister State, Kansas, from the drought, but the outlook for her corn crop also is unusually encouraging, while her potatoes and fruit seem better than her neighbor's. Colorado, New Mexico and the Western Territories do not yet raise sufficient crops even for the support of their sparse population, and this year the whole region has been subject to a drought more severe than any that has visited the more easterly States, with effects proportionately more disastrous.

In the "border" states of the South hay, grain, and fruit crops have been greatly injured by the drought, except corn, which is still very promising. Farther South the acreage under cotton has increased 7.36 per cent., making the total area under it probably 13,612,978 acres. Assuming the crop of last year to have been 5,675,000 bales, from 12,679,962 acres, the acreage of this year would yield 6,085,000 bales; but in view of the labor and insect questions, it is hardly safe to come to a conclusion in the matter at this day. Other crops throughout the South seem to be almost an average, all average yields of grain in that section being considerably below the average of the same crops in other parts of the country.

Cotton-seed Meal.—This ought all to be consumed in our own country, instead of exporting so great a proportion of it, as it is not only a highly nourishing, but a health-keeping food. The oil in it lubricates the bowels of animals, and keeps them in good condition, while the other elements of which it is composed assist in building up the muscles rapidly. But it should be fed sparingly, and mixed with either bran, middlings, oats, or other meal. From a pint to two quarts per day is a fair ration with other food, according to the size of the animal, although at the South, we are informed, they feed it still more abundantly. There they usually feed the seed whole as ginned from the cotton, and after boiling they let their animals eat as much as they please with impunity, almost entirely fattening their swine with it, finishing off with corn two weeks or so before slaughtering.

Teaming at the Cape of Good Hope.—The English General Cunynghame describes some extraordinary teams both of horses and cattle which he encountered during his travels in the Cape Colony. He says: "As we were driving out of the town of Swellendam we met a wagon with a team of ten horses, which a Dutch farmer (his nose surmounted by a huge pair of green goggles) was conducting with perfect ease. This ten-in-hand passed us at a rapid rate. He was assisted by a Hottentot who sat beside him on the box, with a whip resembling a 17-foot salmon rod, which he wielded with the utmost dexterity, touching-up any horse that his master ordered him, exactly on the part that he considered advisable."

And again, when driving inland from Port Elizabeth, "On the road we met at least one hundred and fifty large wagons, each drawn by a 'span' of sixteen pairs of oxen abreast, thirty-two in all, loaded with twenty-two bales of wool. On a rough calculation the value of each load was about £700 (or, say $3,500). Thus we met upwards of $500,000 worth of wool on its way to Port Elizabeth. Most extraordinary sounds proceeded. from the drivers of these wagons."

"At Port Elizabeth we observed the milk-boy (native) going his rounds. His manner of carrying the milk deserves mention. Over his head he wore a sack with a hole for his head, and one for each arm. At both front and rear were seen rows of pockets, in each of which he had placed a bottle of milk,—milk at the Cape being invariably sold by the bottle."

It rarely occurs to country people that trees and shrubs may be successfully transplanted in June—in fact in July or August. All transplanting that is not accomplished in Spring or Fall is left until the next Spring or Fall, as if failure would inevitably attend an intermediate season. No doubt this is true of plants ordered from a distance. But we have many times removed small shrubs and trees from one place to another in our grounds during the Summer months. It is best, however, to preserve all the earth about the roots, that can be preserved, and then to cover the ground for three or four feet about the stem with hay or straw six inches or more in depth. This will preserve the moisture about the roots until growth recommences. Thus we have treated two peach trees transplanted the middle of June. One of them did not even lose its leaves.

Plowing by Lightning.—We notice that M. Feliz of France, at the Bar-le-Duc Agricultural Show, attached his electric machine to a double-furrow plow and turned up the soil of hard, uneven ground, to the depth of seven to eight inches. We hope this was not done at *lightning speed*, if so, it would puzzle the plowman, we fancy, to hold on to the handles. But, perhaps, it was a self-regulator, and knew when to stop and turn of itself. We shall be glad to learn more of this motive power hereafter; but we much doubt of its superseding animal power, at least for the present; so the breeders of strong horses, mules and oxen need not despair of their soon being displaced by *chain lightning*.

The great amount of editorial labor involved in getting up this number of the Rural New-Yorker—which is probably the most complete and trustworthy crop report ever before presented by any journal—together with the Fourth coming upon our day of going to press, has delayed us one day.

BRIEFLETS.

It will be seen that Clawson is the favorite wheat of the country—Fultz next.

We are sad to hear of the dangerous illness of Mr. M. B. Batcham, of Painesville, Ohio.

Mr. M. B. Prince of North Carolina writes us: "I can make a trifle better report on weevil-eaten peas than some of your correspondents. March 24 planted 200 peas or rather shells, 44 germinated and produced fruit."

At the present time, we should select among raspberries, Turner for early; Cuthbert for late; Belle de Fontenay (Henrietta) for size and quality; Caroline (yellow) and New Rochelle (purple) to complete a handsome and excellent little assortment.

It will be seen that our present reports under "What will the Harvest Be" are a corroboration of the probabilities predicted in the crop reports of the Rural New-Yorker of April 10. We cannot look upon these numbers otherwise than as of great value to the farmers and horticulturists of this, and, in fact, of other countries.

The hay crop of Long Island may be fairly estimated by the following: Mr. A. J. Hewlett has 40 acres, and has harvested 20 tons of hay. Mr. George T. Hewlett also has 40 acres, and has harvested 16 tons. The Rural Farm has 12 acres (mostly low-lands) of mowing ground, and has harvested 12 tons. Scarcely less than two tons per acre is the average of these fine lands in ordinary seasons.

Dr. Salmon, who is at present living near Asheville, N. C., writes us: "I see by the Rural you have been at Tryon Mountain. The thermal belt, so-called, is said to exist on all of our mountains at a certain hight; but more has been made of it in the neighborhood of Tryon than elsewhere, though the belt seems to me to be less accessible than in some other localities. Doctor McAboy is very enthusiastic in regard to it, however."

One of the regrets we are constantly feeling is that, in the growing season, we find it impossible to visit the many good friends of the Rural New-Yorker, who urge us to do so. One of these pressing invitations, just received, reads as follows: "You owe us a visit. We want you to pay the debt this week, and see us in the driest time that ever was. You want a respite—a change. So do we. You need not wait to notify us. Come unheralded, any day or hour most suitable. Conveyance from depot 25 cents per head. To depot, lodgings, meals, &c., free, *gratis*. Come quickly. Anything to tempt rain. Bring Mrs. Rural, *too!* Declinations out of order. No proxies! Languidly yours, W.

LATEST CROP REPORTS.

Pennsylvania.

(Continued from page 443.)

NATRONA, Allegheny Co.—The wheat crop here is the best we have had for many years—about the usual number of acres was sown. Some farmers have finished cutting. Wheat ripened about eight days earlier than ever known here. Oats are doing well. Corn and potatoes are doing finely. Plenty of rain. Grass is not more than half a crop—the dry weather in the Spring cut it short. No Army worms; a few Rose bugs and potato beetles. Hay sells for $12 per ton; oats, 40 cents per bushel; wheat, $1.10; corn, 50c.; potatoes 40c.; butter 12c. per pound; eggs 12 cents per doz.; apples and peaches scarce. S. S. F.

NESCOPECK, Luzerne Co.—I live in the west end of Luzerne county along the Susquehanna River. The land is a sandy loam in some places mixed with gravel, and the principal products are wheat, corn, oats, and potatoes. Rye is not a staple crop. No sorghum is raised hereabouts that I know of. No barley is grown. From one-fourth to one-third of the land is sown to wheat each year, and nearly as much to corn. The acreage this year is fully up to the average and the crop prospects are good. The drought has shortened the straw and has injured the crop in some places. Where the soil was sandy it stands well on the ground and the heads are looking well and it is beginning to turn for harvest. I think the wheat will be over an average crop, considering the dry weather we have had. Grass is not half a crop, and will not make half a crop of hay on account of dry weather. Oats will be short. My Ennobled oats are doing nicely. We have had a very dry season so far. The fruit crop is about middling. Apples will be good; but the other fruits are not below an average. S. M.

NEW CASTLE, Lawrence Co.—Wheat is above an average crop both in yield and acreage. Corn is a full average acreage, but is not bidding fair for a good crop. Of potatoes more than an average acreage was planted and they bid fair for a good crop if the farmers fight the bugs hard enough. Oats are an average; but they are short on account of drought. We are having nice showers now that will help them somewhat. Rye and barley are but little grown and of sorghum there is none at all. R. A.

PITTSBURGH, Allegheny Co.—The wheat crop is good, and so is rye; but the Spring grains, oats and barley, will be about an average, with short straw. Hay will be light but perhaps as good as last year. Corn, potatoes and all fall crops promise well. We are now having splendid showers. Sorghum is grown but very little in this part of the country. The acreage of all crops will com- We have had good crops of strawberries, raspp are very favorably with that of previous years. berries and cherries, but the crops of apples, pears and peaches will not be heavy. Apples, pears and cherries succeed here much better than peaches; those are frequently killed by Spring frosts. B. A. E.

WEST AUBURN, Susquehanna Co.—Grass is light; oats are good; potatoes are doing well. Wheat was badly winter-killed, but what is left looks well. Of apples and peaches there are none in the valley and only a few on the hills. A. R. B.

Maryland.

DAVIDSONVILLE, Ann Arundel Co.—Our wheat harvest is just finished. The grain is not nearly equal to the promise which the straw gave. Corn and potatoes look very well, Oats improving. No rye or barley grown. Our wheat is of the Fultz variety. Acreage of all the same as usual. No sorghum. Fruit very scarce, none raised except for home consumption. W.

INGLESIDE, Queen Anne Co.—Our wheat harvest is turning out very good. The rust hurt wheat somewhat, or we would have had an excellent crop. Corn is looking fine, and promises a very fine harvest. Potatoes, oats, and barley are not cultivated to any extent. Rye is very poor this year—very short, and not filled. The acreage of corn and wheat is about the same as in previous years. Fultz wheat is the leading variety. The corn is just a common Flint sort. No care seems to be taken to improve the variety. No sorghum is grown here. Fruit is not so promising this season as usual. There will not be more than half a crop. The early varieties of peaches have proved to be the most fruitful this season, but, as a general thing, the later sorts are the most successful.

C. H. J.

Ohio.

BARLOW, Washington Co.—Wheat is not very good here; but corn promises very well. Oats are getting along finely. Apples, too, are doing well, and peaches are abundant. Cherries and other small fruits are medium crops. T. L. O.

BUCKS, Columbiana Co.—Wheat is good—varieties, Fultz, Baltic, Blue Stem, Clawson, Michigan White, Red Rough-and-Ready; average, 20 bushels per acre. Corn very fair: varieties, Hackberry, Yellow, Gourd Seed; average, 60 bushels. Potatoes are looking very well; the bugs bothering us somewhat; all kinds are raised here; one man had 36 kinds at our county fair; average, 100 bushels. Oats are looking well; varieties, barley oats, yellow and white; average, 35 bushels. Of rye very little is raised. Barley is very light; but little is raised; average yield, 30 bushels per acre.

A. H. A.

CAPTINA, Belmont Co.—Wheat is two-thirds of a crop; Clawson and Fultz are the varieties mostly grown. Potatoes are good. Early Rose and Peachblows are most abundant. Corn is doing well. Sorghum small. The fruit prospect is good. A. T.

CHATHAM CENTRE, Medina Co.—The wheat crop is the best ever known in this part of the country. There is scarcely a poor piece to be seen. Corn is not as good as last year; worms troubled it some. Potatoes are looking fine. Hay is about two-thirds of a crop. There is plenty of fruit of all kinds. We had plenty of rain this spring.

WM. H. M.

CLARKSFIELD, Huron Co.—Wheat is the best crop for many years. Corn is small but healthy, and only wants good weather to make a good crop. Potatoes promise fairly. Oats look well and will be a good crop if we have sufficient rain. Of rye and barley only little is sown here. Our varieties of wheat are: Clawson, Fultz, Lancaster, Gipsey and Mediterranean; of corn, Hackberry, Kentucky white and several other sorts; of potatoes, Early Rose, Late Rose, Peachblow, Snowflake, Early Ohio and Vermont, Peerless and many other sorts; of oats and barley, White Dutch and common white. The acreage under wheat is 50 per cent. greater than our average of the past five years, and 30 per cent more than last year. Oats are about an average; potatoes the same; corn, ditto. Of sorghum very little is grown. For apples the prospect is unusually good. Peaches fair, though but few trees are cultivated. Grapes good. Our varieties of apples are: Baldwin, Tulpehocken (Fallawater), Gate, Seek-No-Further, Talman's Sweet, Russet Sweet, Golden Sweet, Northern Spy and others, all doing well here. But few pears are grown, yet they thrive and bear well. I have some Bartletts that bear every year. A. J. B.

CLYDE, Sandusky Co.—The wheat crop for 1880 is the largest we ever raised here, about 20 per cent. acreage more than last year and very good. Fultz wheat is taking the lead and Clawson next. Wheat is about half harvested. Other crops about an average, looking reasonably well. Potatoes are looking well, but bugs are plentiful, and we have to fight them. Sorghum is not raised very extensively here, though a great many farmers raise from one-quarter to one-half an acre. The statistics are taken by the assessors and will be published. The fruit crop will be good, but fruit trees have more enemies this season than ever before. Caterpillars are very numerous, and there appear to be two kinds of blight. Peach trees are not as healthy as they used to be; our cold winters are too hard on them.

J. L. A.

COLUMBIA, Franklin Co.—Wheat, the staple of the neighborhood, covers 20 per cent of arable land, and the acreage is larger than the average. The yield too is above an average. It is now being harvested in fine condition, and several days earlier than usual. The varieties are: Clawson, Egyptian Silver Chaff, Arnolds's Gold Medal, Golden Straw, Fultz and Velvet Chaff. Corn, average acreage; same per cent as wheat; prospect very good. Oats, rye and barley little grown. Potatoes cover one or two per cent of arable land, and promise a fine crop. Early Rose, Early Vermont and Snowflakes are the leading varieties. This is a poor section for fruit, but the promise is of more than an average crop. Not much sorghum grown. Farmers are watching the experiment of Le Duc and others. Meadows rather light. The whole outlook is for a season of more than average abundance. C. E. T.

FELICITY, Clermont Co.—Splendid growing weather now. Wheat crop only middling, about the same amount was sown as the year previous, but it is not so good. The most common varieties are White Mediterranean and Clawson. Oats are good though not more than half as much was sown as usual. The common white oats are generally used here. Rye is seldom grown except to turn under for the benefit of other crops. Barley not raised. Corn growing finely, which is quite necessary as it was generally planted late. The common yellow and white Dent are the varieties mostly grown as a field crop. Tobacco is the staple crop grown here. Fruit prospects are good, especially peaches. Sorghum is not raised as extensively as formerly. L. J. A.

LEWISVILLE, Monroe Co.—Wheat is nearly all cut, and we think it fully as good as last year, and about a quarter more was sowed. Blue Stem, Fultz, White Lake, White Amber and Michigan Mixture. All sorts are good this year. Corn is better than last year, with about the same acreage. Oats look extra well—about same acreage as last year. We think there will be at least double the number of bushels Potatoes will be at least four times as good as last year although only about the same area was planted. Plenty of rain and very few Colorado beetles. The varieties grown are: Early Rose, Twaddle's, White Peachblows and others. Of rye and barley scarcely any is raised here. Sorghum is grown here only for home consumption. The climate and soil suit it pretty well; but as yet we have no market for it. The apple crop is very good. The following are some of the best bearers and the hardiest:—Early Harvest, Malden's Blush, Baldwin, Roman Beauty, Russet, Fallawater. In fact, this county is very good for apples and pears, but very poor for peaches. We are having a wet summer, so we have a large crop of hay and fine pasture. Farmers are full of life; they talk of holding their wool for 50c. Money is very plentiful now. R. G.

MADISON, Lake Co.—Wheat above the average—Clawson,, Diehl, and Mediterranean. Corn fair—mostly dark yellow Dent. Potatoes very good—Peachblow, Early Rose, Snowflake, Peerless; acreage below an average. Rye, fair what there is of it, but little is sown. Barley, little if any sown. Oats a fair average yield; average acreage. No sugar cane is grown here. Prospects of fruit never better. Apples an immense crop of general selection. Pears a medium crop—Bartlett, Clapp's Favorite, Seckel, Duchesse, Flemish Beauty and others. Peaches a medium crop—Vandyke, Smock, Lord Palmerston, Comet, Crawford's Early and Late Richmond, and Galway, valuable in the order named. Plums, none saved except my own Lombard which are an immense crop. Damson, fair; Reine Claude, medium; Yellow Egg, medium; Washington, no crop. Currants, good crop—Versailles, best. Blackberries, immense — Taylor, best. Raspberries, good crop—Red Herstine best; Black Mammoth Cluster and Gregg. D. L.

NORWALK, Huron Co.—The acreage of wheat last fall was the largest ever sown in this county, and the stand never was better. Harvesting has commenced; the varieties principally grown here are Fultz, Clawson and Lancaster. Corn and oats are about an average. But little rye or barley is grown. The hay crop is light. Sugar cane has been more extensively planted this season than for several years. All kinds of fruit are abundant. C. A. M.

WILLOUGHBY, Lake Co.—A large acreage of wheat and good prospect of a big yield. The best variety is the Lancaster. Other cereals have the usual acreage and never looked more favorable. Variety of oats mostly common white (a few black). Sorghum is not cultivated. Fruit is abundant.

W. J. H.

WESTERN STATES.

Michigan.

BENTON HARBOR, Berrien Co.—Wheat looks well and we shall have over an average crop. Corn is also doing well. Sugar cane is not much grown here. Potatoes make good headway where the bugs have been killed. I tried London-purple and think it is far in advance of Paris-green. Early and Late Rose and Peachblows are mainly raised here. Rye and barley are not raised to any extent in this section. The apple crop will be good; the trees set very full, but the high winds have thinned them. Raspberries, blackberries and grapes will yield well. W. G.

BYRON, Shiawassee Co.—Wheat is looking well; acreage is larger than usual; Clawson is mostly grown, also some Fultz. Corn not looking very well, owing to so much rain; acreage is under the average from the same cause; yellow, eight-rowed, white Flint and different varieties of Dent are grown. Potatoes grown are chiefly Early and Late Rose; acreage less than usual. Oats are looking fair as usual. Rye is not much grown. Barley is looking well but not much is raised. Sugar cane is not grown at all. Prospects of fruit are good. Small fruits extra-good. Cherries in abundance. All kinds of apples, pears, cherries and peaches do well. H. C.

CLAYTON, Lenawee Co.—We have just had a much needed rain and everything is growing finely. We had a very wet Spring making corn and oats somewhat later. Of both there is rather more than the usual acreage. Oats, if nothing happens, will be a very heavy crop, and early-sown will crowd the wheat harvest closely. Of wheat, I should think, there is one-third more than usual. We shall begin to harvest it about July 5 generally, although on sandy land some have already commenced. For potatoes, the prospect is good; probably about enough have been planted for home consumption—Early and Late Rose; a few have the RURAL'S Beauty of Hebron. I raised about a peck from the one small specimen of this potato sent me last year, and this year have a fine patch. A few Peachblows are also raised here. Rye is grown but very little here and barley not at all. Very little sorghum is grown and what there is generally rather poor stuff. The prospects for fruit are very good. Small fruits are abundant and very cheap. Of apples there will probably be a large crop. The most successful kinds are the Winter varieties, the R. I. Greening, Baldwin, Northern Spy and Steele's Red Winter. Peaches look well, everything is loaded that is large enough to bear. The varieties: on sandy soils Clawson wheat is principally raised; on clay and loam soils Lancaster and Egyptian and a bald red wheat called here Patent Office wheat are the favorites. The yield here will be from 15 to 30 bushels per acre. A.L.V.

COLDWATER, Branch Co.—Wheat is an immense crop—20, 35, 40 bushels to the acre. Clawson and Centennial Club are the best sorts. Potatoes will be a large crop—Snowflake, Early Rose, Peachblows. Peaches and apples promise very large crops. The Baldwin, Spy and Wagener are the best bearers. Cherries, currants and small fruits are large crops. Hay is heavy. Oats splendid. No Sorghum of any account. Corn looks fine on high grounds. In Orland, Ind., the weevil is damaging the wheat very badly. W. L. S.

DOWAGIAC, Cass Co.—Wheat has a large growth of straw and a large acreage. Clawson is grown a good deal, but it is not liked for flour. Very little sorghum is sown. The Seneca Chief strawberry is very excellent where properly cared for. Apples are grown here quite extensively, and pears on a small scale, as they are troubled by blight.

W. M. F.

EAST DAYTON, Tuscola Co.—Wheat good; the harvest is six days earlier than usual. Corn better than usual. Oats are the best they have been in a number of years. Of barley, not much is sown in this locality. Clawson wheat is the variety mostly grown here. A large crop of apples is expected. Northern Spy, Baldwin and Canada Red, are the most profitable. More sorghum has been planted than usual this season. L. P.

GRAND RAPIDS, Kent Co.—Some Spring wheat was killed. On heavy land it is three-fifths of a crop; on light land a full crop. Corn is backward on account of wet weather. Potatoes are very promising. Oats and barley fair. Clawson wheat, Yellow Dent corn, Early and Late Rose potatoes, white oats, are the varieties, mostly grown. Comparative acreage, wheat, ten, corn six, potatoes one, oats four. Rye and barley very little. We are just starting the growing of Amber cane this year on a small scale. Apples and peaches will be heavy crops; pears an average one; grape, excellent; cherries, good—just ripening; currants light. Early vegetables were never better and good prices are secured. C. W. G.

GREENVILLE, Montcalm Co.—The wheat crop will be about three-quarters of a crop. Corn, potatoes, oats, rye and barley have the promise now of being full crops; and the acreage under them is about the same as usual, with the exception of wheat of which about one-third more was sown than last year. Sorghum is of no account here. I know of none near Greenville. The apple, peach, pear and plum trees are loaded this year, and promise fairly. All kinds pay well in this section; also small fruits. We have a good market. Hay is of nice quality. C. S.

HASTINGS, Barry Co.—Wheat in the aggregate is about the same as last year. The acreage is much greater, but the average yield much less. Many fields have been plowed up. Corn is uncertain at present. Many fields were not planted because of excessive rains. Oats and potatoes promise well at present. Of barley very little is raised, and of rye scarcely any. Probably half the wheat raised is Clawson. Considerable Fultz may be seen now ripening, a week earlier than any other kind. It will be sown largely this Fall. Fruit of all kinds is exceptionally abundant; trees already bending down. Of apples probably Northen Spy leads all other varieties. None, or very little sorghum is grown here. J. W. S.

ITHACA, Gratiot Co.—Wheat is badly damaged by the Winter and by the fly; though the acreage is larger than usual, there will be less than half a crop. Potatoes are good. Oats look well now but they are late. Corn is thrifty and a large acreage was put in. Rye is not grown here nor is barley. Sorghum is very little planted as yet. Fruit prospects are good for all kinds except currants and gooseberries, which the worms have destroyed. Please give a remedy for them. (Hellebore dusted on the bushes. Eds.) The hay crop is light. Wheat, corn, oats and hay are our staple crops.

R. I. S.

MUSKEGON, Muskegon Co.—In consequence of the abundance of Spring and early Summer rains upon our sandy soil, all crops show remarkable vigor and promise largely. All tree fruits are in abundance and, what rarely happens, this is the second year consecutively of abundance of fruits generally. I have never seen any sorghum here. In wheat, Clawson takes the lead; in potatoes, Early Rose and White Peachblows. Of rye and barley only a little is raised. S. B. P.

NORTH BRANCH, Lapeer Co.—As near as I can judge, wheat in this locality is about an average crop; on high land it is very good, but on low land it suffered very much from winter-killing. Many pieces were plowed up, but what is left is filling extra-well. I think the acreage is greater than usual. The varieties are chiefly Clawson, Fultz, White Rose, California White and Gold Medal Oats are doing well; in acreage about an average. Meadows are good, except clover on low land, which was badly heaved in the winter. Potatoes are doing exceedingly well, but the young beetles have put in their appearance in unusually large numbers during the past few days. Corn is late on account of wet weather at the time of planting; acreage small. We shall have fruit of all kinds in abundance. D. W. C.

THREE RIVERS, St. Joseph Co.—Wheat is good Corn— hard to tell, backward as yet. Potatoes oats, rye and barley are good. Fultz, Clawson Diehl and Mediterranean wheat are our varieties. Potatoes, Early Rose and Peachblows. Oats, white. Sorghum not extensively grown. Mint very extensively grown, one-half crop. Fruit—prospects are good especially for small fruits, not many apples or peaches. R.

Indiana.

CROWN POINT, Lake Co.—The acreage of wheat corn, potatoes and oats is about the same as last year. No barley or rye is grown to any exlent no sorghum is raised here. The fruit prospects are good for apples, pears and grapes D. K. P.

GLENWOOD, Rush Co.—The acreage of wheat is greater than last year; average yield per acre, 25 per cent. less. Corn, potatoes, oats, rye, and barley are average crops. Fultz and Michigan Amber are our chief varieties of wheat. Of corn Dent and Gourd Seed are the most commonly sown. The usual acreage has been given to all small crops, except wheat; that is 10 per cent. larger. Of sorghum very little is grown here. Apples will be half a crop. Pears and grapes are fine. Peaches light. W. R.

LOOGOOTEE, Martin Co.—Wheat is a very large crop—chiefly Fultz and Mediterranean. Corn looks well for the season; but not much is planted. Oats are good but rusted badly. No rye or barley raised here. Fruit of all kinds is abundant.

W. F. JR.

MOOREFIELD, Switzerland Co.—The wheat just cut is a fair crop—about one-fifth more than usua in acreage. The fly ruined some pieces. The Fultz and Swamp and some Egyptian are the kinds raised. Rye is not much cultivated here. Oats are good; the usual acreage was sown. Corn looks well—about the usual acreage. Early potatoes are good. Sugar cane is not much cultivated. Apples are scarce; that is, the winter variety. Peaches are plentiful where they are cultivated. The hay crop is good. Clover is just being cut. We have had a big rain every week or so. J. C.

NORTH WEBSTER, Kosciusko Co.—Wheat, corn and oats are good. Of rye and barley none is raised. Potatoes good. Sorghum, very little is raised. Fruits of all kinds better than average. Fultz and Clawson wheats are favorites. Acreage in wheat is 20 per cent. larger than ever before. The large white oats beat all the rest; acreage 10 per cent. over last year. Of potatoes the Early Rose is best for early and Cherry Red is best for late. T. J. W.

PURDUE UNIVERSITY, Lafayette Co.—The wheat harvest is in full blast. Quantity large; quality excellent. Yield heavier than in '79. Frequent rains make oats promise well. Corn is weedy; but coming forward rapidly. In river bottoms it has been destroyed by flood. Fultz wheat is the leading variety; 90 per cent of it is sown. The acreage of wheat and corn about equal. A small area of sorghum has been grown. Fruit prospects good. Small fruits give an excessive yield—strawberries raspberries, etc. Grapes and apples promise well.

C. L. I.

WINAMAC, Pulaski Co.—Wheat crop excellent, nearly all Fultz wheat. Corn poor; potatoes good; oats fair to good, but not much sown. No barley. Rye good. Acreage of wheat is large.

Corn average. Potatoes large. Sorghum reasonably large. Fruit abundant. L. J. N.

Illinois.

ASHLEY, Washington Co.—The wheat crop is harvested and the yield very good; the acreage is larger by one half than ever before. The varieties mostly sown are Red Sea, Fultz, Orange Red, Amber and Missouri Red. Red Sea and Fultz are the main crop. Corn is looking fine in spite of the late Spring, a fair acreage has been planted. The white varieties have the largest acreage. Oats will be better than last year; an average yield is expected; the acreage is somewhat smaller than in previous years. The variety mostly sown is the common black. Potatoes are good—yield above the average: the early varieties are now all ripe and are about a week later than last year the late kinds are growing fast. The sorts mostly planted are Early and Late Rose, Snowflake, Peerless, Russet and Peachblow. The Early Rose is the standard for early and the Peachblow for late. Rye and barley are not grown to any extent here. Sorghum is grown to a considerable extent; nearly every farmer raised a patch; it is not expected to make sugar in this vicinity this year, only molasses, this being a new and uncertain thing. The kinds mostly grown are the red and white Imphee. The prospects for all kinds of fruits are good except peaches which will be only one-half a crop. M. J. C.

BAILEYVILLE, Ogle Co.—The harvesting has begun here. Clover is light; Timothy a fair crop Rye is good. Winter wheat that escaped winter-killing is mostly good. Spring wheat is promising, but of it the acreage is less than usual. Oats and barley are about an average in condition and acreage. Corn, potatoes, etc., look well, and are growing fast. Fruit is tolerably plentiful. Cut-worms literally destroyed some fields of old clover last Spring, but the Chinch-bugs and Potato beetles have not done much damage this season, and the Army worm has not invaded this section. The weather was stormy and wet the first of June, but fair from the 4th to the 24th. It has since been showery, but seems to have cleared up now, and all are hoping for favorable weather during the harvest. W. B. D.

BALDWIN, Randolph Co.—The wheat harvest is over in this section, and farmers are now busy either stacking their wheat or plowing corn. The wheat crop, I think, is above the average; but it will not quite come up in yield to the crop of last year, although the increased acreage will most likely make the aggregate number of bushels raised nearly the same. Thrashing has commenced, and quite a number of farmers will thrash as early as possible, believing that wheat will be at as fair a price now as it will be for some time to come. Quite a large number of self-binders were sold in this section this season, which fact seems to be generally known among tramps, who are in the habit of coming here to work during harvest. Consequently there was a scarcity of hands; wages varied from $2 to $3 per day in different localities. Such wheat as I have been able to examine is good, well-filled grain, though hardly as fine as last year's. Oats are doing splendidly, they will be ready to harvest about July 8th; there was hardly as large an acreage as last year, the wet, late Spring, preventing sowing. Corn is doing finely, although most of it is very weedy; but most farmers are plowing it as fast as possible. Northeast from us, towards St. Clair county, and in the southeast part of St. Clair, the chinch bugs are damaging it considerably. I saw two fields that were very badly injured by them; and on another field from six to ten rows on the side next to a wheat field, were almost all killed. This pest we have not had for five or six years. Hay will not be as good as usual; in some places the Army worm has stripped it clean. Potatoes are very good. We will have a superabundance of fruit. Cherries were plentiful, but are now all gone. Blackberries are ripening, and all over the country we see the bushes loaded down with fruit. Altogether, this is a very good year, so far, for the farmer. We had a heavy wind storm and hard rain on June 26th that may damage wheat that is still shocked in the field. N. J. S.

BERLIN, Sangamon Co.—We are just in the midst of harvest here, and the wheat is very good. Having been badly winter-killed here last Winter, the yield per acre will not be great, but the larger area sown will more than aggregate the quantity of last year. The kinds of wheat most grown here are the Clawson and Fultz. The climate here not being adapted to Spring wheat, there is not much of it raised. I sowed five bushels of Eldorado Spring wheat last year—costing me $4.25 per bushel—and got 22 bushels from the five bushels sown. I am trying some this year, and think it will not do as well as last year. Corn is very promising and bids fair to make the largest yield we have had for a number of years. Corn and grass have four times the area of all the other crops grown here. Our cattle may be seen mowing a thousand hills—their harvest time lasting about six months. Oats and potatoes are growing sufficiently to supply the demands of the country. Of rye but very little is grown, while of barley there is none. A number of years ago the people about here got the sorghum craze badly, and went into the business deeply—erecting one-horse iron crushers for extracting the juice, and evaporating pans for the purpose of making it into sugar; but the nearest they ever got to that consummation was to make what they called molasses, and, for my life, I never could tell by the taste of it, whether it was sweet or sour. I once visited one of these sorghum mills, and at the time they were crushing cane that was so full of chinch bugs that I had to hold my nose to keep from inhaling the unpleasant odor arising from mashed bugs. The people about here have effectually got over their sorghum craze and will be very loath to embark in the business again. The apple crop is very light; some orchards are almost destitute of fruit. S. H.

BUNKER HILL, Macoupin Co.—We are rejoicing in an unprecedented degree of prosperity—in fact an agricultural boom. The oldest inhabitant retires in disgrace, for he never saw such a crop year, and he was here before the "Winter of the deep snow" (1830). The wheat harvest is well advanced and the yield is uncommonly large and the acreage fully 33 per cent. larger than in any previous year; I have heard of only one field being thrashed, which turned off 30 bushels per acre. Wages for harvest hands, owing to the great demand and scarcity of help, are $2.50 to $3. The oat crop is very good and will be in condition to harvest before the wheat can be stacked. Few were sown because of the great breadth in wheat. Corn is very promising—never better. Potatoes are first-class. Rye is only sown for pasture, but it has produced a fine growth. Barley, none raised. Sorghum receives little attention, being crowded out by the more important crops. Meadows are rather light, owing to dry weather in early spring. Pasture fine. Cattle fat. Fruit of every kind, save apples, in great abundance and of excellent quality, and it would seem that the long-deferred hopes of the granger were about to be realized. This will apply to Macoupin and the six adjoining counties. W. W. H.

CHAMPAIGN, Champaign Co.—No crop far enough along to be safely reported upon, except Winter wheat. That is very good, with an acreage double that of last year—yield per acre between 15 and 20 bushels. Harvest under full blast now. Many varieties are cultivated, Walker, Red Chaff, Mediterranean, Alabama, and the Fultz and Clawson are rapidly coming in. Sorghum still a small crop, though every farmer has a patch to make his own sirup—Amber Cane generally. All fruits are good, but apples bloomed large and the fruit dropped. This on the east side of the State, on west the apple crop is large. B. F. J.

FAIRFIELD, Wayne Co.—Wheat is good, mostly Swamp and Fultz. Oats are a fair crop. Potatoes are fine. Of rye and barley but little is grown. Some sorghum cane is grown here. E. A. R.

HILLSBOROUGH, Montgomery Co.—We have finished cutting wheat. It is good in yield and quality. Oats ditto. Potatoes never looked better; all kinds of fruit are abundant. Farmers in this county have this year bought self-binders, mowers, plows and other agricultural utensils to the value of fully $30,000. G.

HUGO, Douglas Co.—Wheat crop bountiful, mostly of Fultz and Mediterranean, and some Clawson. Help can scarcely be secured to care for the crops. Corn was never so clean and nice. Potatoes very promising now; there are some bugs, they are not numerous, however. Oats moderate. Everybody raises sugar cane here, and the screech of the two-horse iron mills resounds day and night all over the land in the Fall. Fruit will be plentiful. Peach trees are breaking where not cared for. Apples very promising. Cherries plentiful; small fruit in abundance. Ben Davis, Winesap, Genet lead the apple list here; the second named bears youngest of all. Oh, we'll all have lots to eat and plenty of money this Fall if we work and economize. Meadows fine. Need rain on corn and pasture lands. A. C. W.

JOSLYN, Rock Island Co.—The acreage of wheat is large, but the crop is very poor; it will not average ten bushels per acre—mostly "Odessa." Corn is our stand-by, and looks well. Farmers expect 50 bushels per acre. Oats are very good. Rye is grown to quite a considerable extent, and is very good. I know of no barley in this locality. There is but a small acreage of sorghum, and it looks inferior. Small fruits, such as cherries, raspberries (Black Caps), grapes (Concord and Clinton), currants and gooseberries are good. Apples—Red Astrachan, Early June, Monarch, Snow, Bellflower, Romanite, Winesap, Ben Davis, Pearmain, Willow Twig, and many other varieties, are rather too full for the good of the fruit and also of the trees. J. C. A.

ONARGA, Iriquois Co.—This is not a wheat-growing county. Not much oats raised. No barley. Not much rye. Potatoes rotted badly in consequence of the cold, wet Spring. The varieties mostly raised are Early Rose and Peachblows. There is about the usual acreage of each in our locality. Not much sorghum is raised, instead a large quantity of flax is grown. The prospect is fair for an average crop of fruits. Small fruits are raised quite largely in this place. J. B. C.

PEORIA, Peoria Co.—The wheat crop looks well. The acreage sown is at least 30 per cent. more than last year. The farmers are all busily engaged in harvesting their rye. We have ours all in shock, and consider it simply first-class. Corn never looked better. Oats look well. We have had no drought in this locality. My Ennobled oats look well, except that they are lodged somewhat. They are now about three feet 10 inches high, and just showing heads. My Ovoid mangels are doing well, so also are my pentstemons, aquilegia, Iris Lævigata, cow-peas and willows. The apple crop is good. Grapes and small fruits are abundant. Peaches look well wherever there are trees. I have not heard of the Army worm in this section. C. P. S.

ROCK FALLS, Whitesides Co.—Winter wheat is an entire failure. Spring wheat is injured by rust and chinch bugs, and will be one-third of a crop. Rye good. Corn is at present very promising, but is injured some on low lands by wet. Oats good, will average 40 bushels per acre. Barley is fair but not much grown. Potatoes are grown only for home consumption. Taking 100 for standard, corn will average in acreage, 75; wheat, five; barley and rye, five; oats, 15. Sorghum is grown to some extent and is likely to be more so in the future. Early Amber variety most satisfactory. J. W.

ROSCOE, Winnebago Co.—Wheat looks good; only little, however, is grown, but that little is double as much as last year. The corn prospect never was better in the last 10 years. The acreage is the same as last year. Potatoes look well but are buggy, or will be, if not looked after. Only a few small patches were planted. Oats were never better. Rye is a light crop. But little barley is grown. Sorghum is planted mostly for home consumption. It makes a good sirup. The census-taker said he never saw crops of all kinds look better than they do this season. Apples are plentiful; cherries abundant. I have never seen currants more plentiful than this year. Grass is light. The dry weather in the Spring hurt meadow land very much. H. G.

Wisconsin.

AUBURNDALE, Wood Co.—I am on the line of the Wisconsin Central R. R. a new country sparsely settled. Our first settlers located here five years ago; the land is good and a good market is at our doors; that is, the lumbermen buy all that we can raise to sell at fair prices. Our crops looked well until June 14th, when it commenced raining, and such a flood has never been witnessed before in Wisconsin by "the Oldest Inhabitant." In the northern part of the State potatoes that were not above ground were all drowned out; about half of the crops was destroyed, but they will be replanted and have time yet to make a good crop. Hay looks better than in any year since our settlement began; but I understand that hay is very poor in the southern part of the State. We have not got to raising any wheat yet. Oats are doing well, but not much is grown in this vicinity. We do not attempt to raise corn—the season is too short. Of course there are no orchards. As settlers are coming in very fast I hope in a few years to be able to give a fuller report. J. L.

CHILTON, Calumet Co.—To judge from present indications the wheat harvest in this immediate vicinity will be more than an average one. Winter wheat that lived through, will be a splendid crop. Oats and barley are also looking well. Hay is slight and the acreage small. Clover was nearly all winter-killed. Chinch bugs have made their appearance, but no damage has been done yet, and we hope the abundant rains we are now having will destroy young bugs and eggs. Fruit of all kinds grown in this latitude will be more abundant than ever before. O. G. O.

CHIPPEWA FALLS, Chippewa Co.—Early sown grain looks exceedingly fine. I never saw it look better at this time of the year. About two-thirds of the cultivated land is sown to wheat, and the remainder largely to oats. Corn is backward, but of good color. Sorghum is very little grown. Small fruits are exceedingly fine. The Duchess of Oldenburg has proven the most hardy apple. C. E. W.

EAST TROY, Walworth Co.—It has been very wet here most of the time for about four weeks, which delays work very much. We cannot work the corn one-half of the time, so that all of the work is coming together—corn cultivating, haying, and harvesting. Winter wheat looks splendid, and bids fair to be a heavy crop. Spring wheat and oats are good. Corn that has been kept clean is very large. The hay crop will be fair, if we can have good weather soon to make it. Potatoes are looking well. This afternoon we have had a very heavy rain and wind, that knocked down the grain very badly. H. A. T.

FALL CITY, Dunn County.—Winter wheat was badly winter-killed; not much is raised here. There is a large acreage of Spring wheat, and it is very promising. Corn was planted late, but is growing finely, and promises an abundant crop. Hay crop light. Clover is all winter-killed. Potoes very good; plenty of beetles to contend with. The fruit crop is promising. The kinds of apples raised here are Transcendant and Russian Crab. The standard apples are not raised here. Wild fruit, such as plums, grapes, &c., are abundant. There have been some very heavy rains here this season, which have done great damage to the crops on the Chippewa River bottoms. The river was never known to be so high; the lumbering business has been seriously injured. The weather at present is warm, with fine showers. Crops are growing finely. G. W. P.

LOUISVILLE, Dunn Co.—Crops of all kinds are looking very well, and will probably be about an average yield if nothing happens. We are having a dry spell at present which, if it continues, will be hard on small grain. We had a big flood which drowned out several thousand acres of crops on low lands.

MONDOVI, Buffalo Co.—The harvest bids fair to be good. The varieties of wheat are Fife and Odessa; of oats, the common white and a few Norways. Barley (the four-rowed) is looking splendid. Of potatoes we raise the Early Rose and the Snowflake. Of corn, the Dent and Flint. Neither is good, owing to a cold spell about planting time. The acreage of these is about the same as last year. Minnesota Early Amber cane looks well; acreage double that of last year. Our apples are Crabs and a few others, such as the Duchess of Oldenburgh; all are bearing well. Small fruits are as good as usual. R. F.

OCONOMOWOC, Waukesha Co.—Winter wheat is looking very fine; the acreage is large. The white variety stood the Winter best. Spring wheat heavy, acreage small on account of so much Winter wheat being sowed. Oats very heavy; acreage medium. Rye good; acreage small. Barley very good; acreage medium. If we should have a hard storm all grain would be likely to lodge. Corn is small, and on account of rain is very weedy. Sorghum is being planted here for the first time this year. W. O. L.

ORION, Richland Co.—Wheat is ripening fast, but is not more than two-thirds of a crop. Spring wheat is very poor and not much raised. Corn was never better; it is of a dark green color and a good stand. A very large acreage was planted. Potatoes have good prospects for a large crop. Hay is a heavy crop on the uplands. All the Wisconsin River bottom hay is ruined with high water. Fruit crop, except grapes, is light. J. H. F.

RACINE, Racine Co.—If we have good dry cool weather for a while all the grain crops will be large in Wisconsin. There is a large increase of acreage. Everything now looks fine. Potatoes are excellent, with but few bugs; but little sorghum is raised in this State; it is one of the "has beens." The farmers, in this section of the country, feel proud of the prospects. A. P. D.

SALEM, Kenosha Co.—The heavy rains last month have injured the grass on the low land very much. Rye, winter wheat and clover were winter-killed badly. Oats, Spring wheat and flax are heavy. A larger amount of corn and potatoes has been planted than usual; the kinds of potatoes grown most are Early Rose, Brook's Seedling and Shaker Russets. Barley and sugar cane are not raised very much. Cherries and raspberries have ripened early this season. Apples will be a light crop. S. J. C.

WEST SALEM, La Crosse Co.—Wheat—mostly Winter Odessa—early-sowed, good but thin; late-sowed all killed. Spring wheat has a fair prospect at present. Corn is growing finely—mostly yellow and white Dent. Potatoes look well; as many varieties almost as there are farmers: there are, perhaps, more of the Early Ohio and Early Rose than of any other. Oats are thrifty, all white. No rye in our neighborhood. Very little barley, but what there is looks well. More corn and oats than last year; potatoes about the same. Rye and barley are seldom raised. Very little sorghum is planted, no more than enough for home use. No very great prospect for fruit; the ends of the limbs are dying considerably. The Transcendent and wild crab prove most successful. We have had two splendid weeks for haying. M. L. H.

Minnesota.

BLOOMINGTON, Hennepin Co.—The wheat crop looks good; it is just heading. It is stout in straw but will only be an average yield from present appearances. Corn is backward for the season. Oats look splendid; we expect above an average crop. Of rye and barley very little is raised here. Potatoes are good. The variety of wheat chiefly raised is the Scotch Fife. Oats, common white and black. Corn medium yellow Dent. The acreage is about the same as in previous years. Of Minnesota Amber cane very little is raised. The general prospect of fruit is good. The apples that have proven the hardiest are the Siberian Crab Duchess of Oldenburgh, and Wealthy. Only the hardiest kinds will stand this climate. Small fruits of the hardy varieties do well R. L. B.

KASOTA, La Sueur Co.—The present prospect for an abundant harvest of wheat and corn is No. 1—Minnesota Fife wheat and Early Dent corn. The acreage of both is increased from last year. Potatoes will be a light crop—beetles too thick. Northern sugar cane crop in township was, in 1879, 30 acres; in 1880, 48 acres. The acreage of oats has decreased from 1879—fair prospect. The amount of rye and barley raised is very small. The prospect for fruit is *extremely* poor. All kinds of apple trees seem to be dying. R. O. T.

MARSHALL, Lyon Co.—In this part of the State crops are just booming. Barley is pretty well headed out and very fine. Oats are just beginning to head out and promise a large yield. Wheat has not headed any yet, but is about as thick as it can stand on the ground. Corn is somewhat backward, but, in these parts, it never does very much till July and August. We have had plenty of rain, and now are enjoying exceedingly fine growing weather. If we can manage to keep free from hail till after harvest, we shall undoubtedly have an unusually large crop. North of us, along the Minnesota River, a few days ago, there was a severe hail storm, which completely ruined some crops, but did not extend far. C. M. Y.

Iowa.

DES MOINES, Polk Co.—I have been traveling over a portion of this county for the past two weeks and I never saw better prospects for crops of all kinds. Corn is immense; the area is larger than usual. Wheat, oats and barley promise good crops. No chinch bug. Potatoes promise a fine crop. W. S. S.

RUSSELL, Lucas Co.—The Winter wheat was all killed, and of Spring wheat but little is sown, and that is considerably injured by dry weather. Chinch bugs are plentiful, and will injure the yield so that not more than half a crop will be realized. Oats bid fair for a large yield; the acreage is larger by one-half than ever before. Corn never looked better at this time of the season than now; acreage fully up to former years. Grass will be lighter than usual, owing to dry weather in May. Fruit is badly injured by late frosts; about one-fourth of a crop. Potatoes bid fair for a good crop. Weather is too dry for all vegetation. A. S. B.

Kansas.

CLAY CENTER, Clay Co.—Wheat which five weeks ago it was feared would be a total failure on account of the drought, is coming in well. The rains of the latter part of May saved it. There was a larger acreage sown last fall than ever before. It is chiefly May and Fultz, the latter was most injured by the drought. Corn and potatoes bid fair to be good crops, though the former is being damaged in some localities by the chinch bug. White and yellow Dent are the kinds generally grown here. Potatoes our farmers have planted on a larger scale than heretofore. Sorghum is grown to some extent. There are several mills for the manufacture of the sirup in the county. There are not many fruit trees in bearing here, as yet, except peaches and the smaller fruits. Peaches were killed by the Spring frosts, while the latter were injured by the drought. A. E. S.

CLOVERDALE, Chautauqua Co.—Wheat is about one-half a crop. The varieties generally are Red May and Walker. Corn prospects are good where the bugs have not destroyed it. The acreage is larger than last year. Early potatoes are almost a failure. Late ones look fine. Oats and rye are failures. Barley and sugar-cane are not much grown. Peach prospect good; all kinds do well. Of apples only few trees are in bearing. Of grapes Concord is the standard. It has been ex-

tremely dry this Spring. Corn and wheat are the principal crops. B. F. T.

ELLIS, Ellis Co.—Wheat is a failure here, but few pieces will be cut. The variety sown was Red May. Acreage in corn is small—the Army worm is eating it. There have been no potatoes or any vegetables grown here for the last two years on account of drought. The gardens are all burnt up. No rye or barley grown. A few have planted sorghum but it is not planted to any extent yet. There is a large acreage under rice corn. No fruit grown here yet, the country is too new. J. B.

FREDONIA, Wilson Co.—Wheat is mostly in the stack; some that has been thrashed turns out poor. Oats are short. Potatoes are poor. It has been very dry all the season until June 25, when we had a big rain. Then the chinch bugs have been bad; they took the oats the RURAL sent me. There is a pretty good prospect for corn now, although we have mostly a poor stand on account of the dry weather. I. S. L.

FREEDOM, Butler Co.—The crop prospects are good. Wheat is all harvested in a good, dry time and is a fair crop. Fultz takes the lead in yield Gold Drop coming next. Corn looks fine and is commencing to tassel. Some chinch bugs are working in it, but we have had two nice showers which checked them somewhat. I am growing on trial, King Phillip, Chester County Mammoth, Kansas Yellow Dent, Brown's Improved Yellow Dent, White-flower Dent and Blount's White Prolific, besides five kinds of sweet corn. Blount's and Brown's are taking the lead. Oats are a medium crop. My Ennobled oats are splendid. Kinver's Globe mangels are doing wonders. I have one Cuthbert raspberry alive after all the bad luck imaginable. I find this a hard climate in which to germinate small seeds, on account of the abundance of weeds that make their appearance on the approach of the first warm day. There is no market to speak of: butter, 12½ cents; eggs, 12½ cents; wheat, 80 cents; corn, 25 cents; potatoes, $1. All green stuff sells high and is scarce. Peas, $2.50 per bushel; beans, $2 to $2.50; corn, 25 cents per dozen ears. Peaches are ripe, but the crop is small, having been cut off by hard and late frosts. On the whole we can say, "Bully for Kansas!" W. J. B.

LARNED, Pawnee Co.—Our wheat harvest is very short; there will not be over 50,000 bushels of wheat harvested in the county, and this will not average one bushel per acre. Corn is good except where the worm has eaten it up. Rice corn is good and a big acreage planted. No oats or rye. Potatoes look well; bugs are trying to eat them all up. No fruit of any kind; wild plums were killed by late frosts. Over 1,000 acres of sorghum planted (Amber cane), and sugar works will be erected here. Lots of rain in the past two weeks. Lots of people leaving to get work. S. S. D.

MCPHERSON CENTRE, McPherson Co.. The wheat in this county will make a good half crop. The berry is somewhat shriveled. The corn will make an average crop if we get two or three showers at the right time. The potato crop will be light. Hay (prairie hay is what we depend upon) will be short and thin. We have had a very dry season up to this date. C. D. R.

PARSONS, Labette Co.—The days are on the wane The wheat harvest is reaped, and in shock. The weather till this has been propitious but now we are having slow but continuous rains. They are quite desirable for everything but the unstacked wheat. The season in many portions of the West is very similar to that of '69—one of the wettest seasons known; but in that season Kansas produced the greatest number of bushels of wheat, corn and oats per acre of any of the States in the Union—this, by reason of sandy loams and natural drainage. Our season, though dry on the whole, has been cool. The thermometer has not been above 90 deg. and blankets and a comforter are required at night. Corn is coming into tassel and should the present rain end now, and we get two inches more in 25 days, we shall have one of the best corn crops ever raised in spite of the chinch bugs which have been operating in isolated places. Vegetables and fruits are more than an average in quantity and quality. "The Osage Ceded Lands," 50 miles by 30, on which we are located, were first settled in 1867, so that this is almost our first season for the bearing of the apple trees, which promise well for quantity and quality. Grass promises excellently. Some new wheat has been received here and sold at 75c. The crop is good. I have to report a matter of precocity and productiveness on the poultry department of this ranche. The good wife who superintends the department reports that in September last a hen produced a brood of chickens, some of which commenced laying before New-Year's. One of the brood laid 25 consecutive days. Another one hatched chickens and one of these chickens has on June 26, laid the twelfth egg in 12 consecutive days. The brood is of a mixed kind, but docile and healthy. J. B.

Nebraska.

BROWNVILLE, Nemaha Co.—The Spring was unusually dry, and winds have prevailed to an extent before unknown. For these reasons the farmer, as a rule, complains. And yet, "all in all," there is really no good cause for complaint. Take all the crops—all the farm products—and there is more than an average. On account of the dry season referred to, small grain is what we call "short"—about a quarter short as compared with average seasons. Corn could not give a better promise than at date of writing. The acreage of all crops is greater this season than ever before. Sorghum is becoming quite a factor in our agricultural products, and will become more so the more that is known of it, and the more it is experimented with. Apples are good. Many were blown off the trees two weeks ago. No peaches this season worth naming. Small fruits are all excellent. The grape crop will be very large and fine, where the vines have been cared for, and kept in shape. Farmers feed their corn principally, and put it into market in cattle and hogs. This mode of disposing of this product "pays" much better than any other. Railroads, for a time back, have not been able to furnish cars as required to put our products into market, particularly live stock. We have shipped as high as twenty-six car-loads of cattle from this place in one day. R. W. F.

CYCLONE, Polk Co.—Wheat will run from 10 to 20 bushels per acre where it is a good stand. Some few fields will not go over five bushels per acre, and some fields will not be cut. We had no rain until June 5th that did any good. Corn is good, it averages from 40 to 75 bushels per acre. Potatoes are good at present; there are new potatoes on the market, the striped bug did them some harm before the rain. They will average 275 bushels per acre. Oats are almost a failure: many fields will not be cut. When good they will yield from 40 to 90 bushels per acre. Of barley but little is sown—fair to good; 30 to 60 bushels per acre. Rye, short—from 12 to 20 bushels per acre. Of wheat we grow the Hudson River, China Tea, Scotch Fife, Blue Imperial, and Odessa. Of oats the common white and black. Of potatoes, Early Rose, Peachblow, Peerless and Russet. Very little fruit grown here; fruit does well here. Sorghum will not yield largely. Crop prospects are good at present, and people are in good spirits. E. C.

DE SOTO, Washington Co.—Wheat, oats, rye and barley will not make more than half crops this year; but what there is will be of good quality—the grain is well headed and the berry plump. Our corn crop at present is very promising and will be a full crop. Corn in the field stands over five feet high planted on the 22d of April. Corn planted the first and second week of May is from three to four feet high and has a fine dark green color. The potato is a very promising crop. We shall have early potatoes fit for market by the first of July. Sorghum has been cultivated in this county for the past ten years. For the last year the Amber cane is taking the place of other cane seeds. The prospect of the fruit crop this year is not good. We shall have not more than half a crop. The varieties of grain grown here are:—Wheat, White Hamburgh, Odessa, Golden Drop, Scotch Fife, Mammoth, Canada Club, China Tea, Italian. Oats—English white and black, German white oats, Scotch Potato oats. Barley—four-rowed and common. Rye—Winter rye. Potatoes—Early Rose, Snowdrop, Peachblow, Victor, Peerless. Peaches—Dunmore Seedling, Burbank Seedling. Apples—Red Astrachan, Red June, Malden's Blush, Rambo, Rawle's Genet, Winesap, Bon Davis, Willow Twig, Jonathan, Grimo's Golden. T. MCC.

KEENE, Kearney Co.—The wheat crop of Southern Nebraska will not be more than one-third of the crop. Grass-wheat is the principal kind. There are also the Odessa, Lost Nation, White Italian and other sorts too numerous to mention. Corn bids fair to be a full crop; of oats but little is raised here. Barley is very short. Potatoes are looking well. Rye is a failure. Sugar-cane is raised somewhat extensively. There are no bearing fruit trees here yet. A. H. B.

LINCOLN, Lancaster Co.—The harvest of wheat is rather below the average. Rye, oats and barley, very little sown, and that light. Corn is about the average. Potatoes are about an average crop. Acreage of wheat, 10 per cent. below average, and of corn 25 per cent. above. Varieties of wheat, Grass and China Tea; Corn, white and yellow Dent. Sorghum is cultivated to a limited extent. Fruit is not much raised in this vicinity yet. S. B. P.

PAPILLION, Sarpy Co.—This Spring has been the driest for years. Small grains suffered badly, but the late rains have revived them so we shall have the two-thirds of a crop. Not much Winter wheat is grown here. Of Spring wheat the varieties are Golden Drop, Grass and Scotch Club. The acreage of small grains is small; that of corn is larger than usual. Corn looks very promising, although backward. I never saw fruit trees bloom so heavily; but the dry Spring has caused the fruit to fall off. There is enough left, however, for a good crop of apples. There are not many peaches on account of early frosts, nor are there many currants or gooseberries. Almost all kinds of fruit do well here except pears, which are subject to blight. Currants, too, do not bear well. Amber sugar cane is grown with good success for home use. Flax does well, and is grown for the seed only. Farmers are losing many hogs by hog cholera. Fat hogs are almost all sold. Prices: hogs, live $3.40; corn per bushel, 20c.; wheat, 80 to 90c; oats, 25; potatoes, 40; butter, 15c: eggs, 15c. E. E. S.

PLUM CREEK, Dawson Co.—There will be no harvest of small grain in this county, owing to the long-continued drought. I do not know of one single acre that will be cut, nearly all has been plowed and planted to corn; the rest is being pastured; the sort sown was Grass wheat. Corn will be about half a crop, if we have rain from now on. We cannot tell about potatoes yet; but if we get one potato to each bug there will be a big crop. There is considerable talk about Early Amber cane and some small lots have been planted, but there is no mill here to work it. I think this a good locality for fruits, but there has been very little attempt to plant any as yet. Of the plowed ground corn has about 50 per cent.; potatoes, two; barley, 10; wheat, 25; oats, 15. Wheat yields per acre from 20 to 30 bushels in a good season; corn, 75 to 100; rye, 50 to 75; barley, 40 to 50; potatoes, about 200. I have been here but two years and have not got in shape to do much in farming yet, owing to some hurry. W. W.

SEWARD, Seward Co.—The harvest of wheat, corn and potatoes is promising. Oats and barley are failures on account of drought early in the Spring. Where wheat was put in deep it stood the drought and looks well, but where it was not the ground was plowed up and planted with corn, so that the acreage of wheat is small, while that of corn is very large. Of wheat we have the Odessa, Sandal, Sea Island, etc. Corn is highly mixed. Among potatoes we still hold to the Early Rose and Peachblow. Sorghum is not raised to a very great extent; but does well here. In regard to fruit, we shall have little or none this year. This county has had a hard struggle to get orchards to thrive so as to bear fruit. The top grows fast enough, but the sun and hot south winds crack the bark and thus spoil the tree. The Russian and hardy fruits of that kind are mostly called for for growing trees. Snyder blackberries are prolific here. Grapes of all kinds do well; the Concord takes the precedence. P. M. C.

UNADILLA, Otoe Co.—The outlook for a harvest is good in this part of Nebraska. I have never seen corn looking so well. Potatoes are good. Oats are looking fine where they were sown thick enough. Rye is excellent, but, owing to the open and dry Winter, all Fall-sown grain is very thin. Wheat is a failure in some localities, but we shall have enough for home use. Barley is an entire failure. Sugar-cane is grown to some extent for sirup. Of corn there are ten acres to one of other grains. Fruit will not be a large crop, owing to dry and hard winds. A. J. F.

Colorado.

HUSTED, El Paso Co.—Wheat and corn are not grown here; potatoes very seldom. Oats, rye, and barley ditto. Various varieties of each are successfully raised in favorable seasons. No sorghum is raised in this county. Fruit—that is to say, canned fruit—we have in abundance. We have all kinds that are canned in America. J. E. R.

TEXAS CREEK, Fremont Co.—This southern part of Colorado is better adapted to the raising of stock than farming; but very little farming is done, and that only where water can be had for irrigation. Very little fruit is raised; but it does well in some parts where it has been tried. Crops of all kinds promise an average yield where there is water enough to irrigate. Wheat, corn, oats, barley and potatoes are grown here, but there is no rye or sugar cane in this locality. On Texas Creek and its tributaries there are not over 100 acres of wheat and about the same of oats; of barley ten acres, and probably 30 to 40 acres of potatoes. The acreage of hay is three times that of all the grains. H. M. L.

Missouri.

AVILLA, Jasper Co.—Wheat will average 25 bushels per acre; it is well headed and filled out, the grain being fuller and plumper than any I have ever seen. I have 75 acres that will yield 40 bushels per acre, and a neighbor has 1,100 acres from which he expects 23,000 bushels. Corn is tasseled and in fine condition; the crop is so heavy that corn will sell here for 12½ cents per bushel in Fall. Flax is a large crop here and is excellent. Potatoes are fine. All kinds of fruit are splendid, the trees are breaking down under their loads, and the market is overstocked. Oats are as fine as I have ever seen. Vegetable gardens are in prime condition. All sorts of stock are well. A. E. B.

COLUMBIA, Boone Co.—Wheat harvest nearly through. Both yield and acreage nearly 10 per cent. above those of 1879. Fultz, Smooth Mediterranean, Clawson and Zimmerman are the leading varieties. Oats promise an unusually large yield, but the acreage is small. Black Egyptian and Rust-proof are the principal sorts. The corn prospect is fine, but it is too early to predict the yield. Evans, a large, yellow Dent variety, is the leading sort grown here. Potatoes are unusually good; but are grown only for home use. Early Vermont, Early Rose and Beauty of Hebron are the leading sorts. Sorghum is grown very little at present, but the agricultural college, located in this county, expects to erect steam works for sugar making next year. Apples will give a heavy crop; peaches, half a crop; pears, a full one; but there are very few trees. Grapes are very full and healthy. Grapes and apples are our leading fruit crops. S. M. T.

FULTON, Callaway Co. Wheat all harvested and mostly in stack; the crop is good, some fields will make 30 bushels per acre—Fultz is most common. I raised a good crop of Jennings. Oat crop is heavy. Hay crop heavy, the best for several years. Prospects for corn good. Pastures good. Seasonable rains. J. L. S.

GLASSVILLE, Caldwell Co.—Very little wheat grown here. Corn is the principal crop and it never looked better. It will average, about 40 bushels per acre. Potatoes will be a light yield, it is too dry. Of oats, rye and barley there is none; they are a failure this season. Nearly every farmer grows from two to four acres of sorghum. It does well. Peaches do well. I have Amsden and Alexandria ripening in my nursery now. We grow all the leading varieties. Of apples, Missouri Pippin, Ben Davis, and Jannet are the leading varieties for Winter, and Early Harvest, Red June, Golden Sweet, and Red Astrachan for Summer. A. J. D.

SPRINGFIELD, Greene Co.—Greene county has never before had so much wheat to harvest as this time, and it is uniformly good. The weather for harvest was never better—fair and cool. Nor was it ever better utilized. The wheat all ripened so nearly at the same time that all available help was in requisition. Never before have we heard such agricultural music as filled our ears from busy reapers, of almost everybody's make, running like things of life in everybody's fields, and some of them ran all night several times by the clear light of a full moon. Even good Luna smiled upon the harvest. It is over, and now the rain comes just as we need it for our corn, for a full crop of which the prospect is really good. Oats, now nearly mature, are also very good. Pastures have held up finely and are now to be renewed and brightened up by the rains. Fruit is abundant. Amsden peaches are ripe; so are Red June and Prince's Harvest apples and Doyenne d'Ete pears. J. O. T.

SOUTHERN STATES.

Virginia.

DUNNSVILLE, Essex Co.—There is not over half a crop of wheat, but the quality is good. Crop of corn is looking well, but it is late. Fruit crop rather poor. Gardens are very poor, Pasturage lean, clover very short. No hay. Wire grass the only crop that stood the excessive drought. We have had a little rain in June, none in April or May. O. B.

NEW MARKET, Shenandoah Co.—We have had a dry season until the last two weeks. Now it is very seasonable for growing crops. Harvest is over; farmers are thrashing. Wheat is well filled, and turns out well, except in places where the Army worm was at work. The hay crop is not very good, owing to drought. Vegetables are plentiful. Small fruit ditto. Apples, etc. will be enough for home use. Wheat is worth 96c. to $1; corn, 60 to 65c; rye, 60c; oats, 35 to 40c; bacon, 5 to 8c; chickens, 15c each; butter, 12 to 12½c; eggs 10c; potatoes, 50c. We have the best corn growing weather, alternate rain and sunshine, all this week. Farmers are busy and times lively. Early potatoes are an average crop R. I. W.

SWOOPE'S DEPOT, Augusta Co.—Wheat in this section is harvested, and is very inferior to last year's crop, being damaged greatly by late frosts. Fultz seems to have suffered most. Some fields of that sort will not produce over a third of a crop All is more or less shriveled—oats show badly Late rains have brought out grass considerably. Corn promises fairly. S. C. B.

West Virginia.

WEST LIBERTY, Ohio Co.—Wheat never was so good in the memory of the "oldest citizen"—variety principally Fultz; acreage 40 per cent. more than last year. Of rye not much is grown. Barley, acreage small, but yield good. Oats, average in yield and acreage. Corn, acreage 10 per cent. of increase; prospect very fine. Potatoes, prospect good to very good. Meadows, yield not exceeding 75 per cent. Apples, a fine crop; pears nearly a failure; peaches abundant; grapes, the largest crop ever known here; cherries, plums and quinces abundant, and all small fruits plentiful. Of 38 varieties of grapes I prefer Rodgers's No. 9. All sorts of apples do well. Of 18 varieties of pears I prefer Buffum, Vicar of Winkfield and Belle Lucrative for bearing and quality. Sorghum not grown much. M. M. D.

Kentucky.

OWENTON, Owen Co.—Wheat, grain good; yield, 20 per cent. below average. Corn is fine. Potatoes, large yield for early, late not matured. Oats, rye and barley good. Varieties of wheat, Fultz and Blue Stem. Swamp wheat was formely most popular. Early Rose and Peachblow potatoes are esteemed highly. Sorghum is raised only by people not able to buy molasses. Fruit crop not large. J. W. W.

Tennessee.

CHURCH GROVE, Knox Co.—The wheat in this district is on an average with other years. A larger acreage was sown than ever before. Varieties are Bowden, Walker, Fultz, Swamp; the last-named is the surest crop. Corn will be very light on account of the dry weather. Potatoes are a fair crop owing to early rains. Varieties planted are Russet, Early Rose and Snowflake. Oats are very short; drilled oats are best. Of rye a small acreage was sown; yield good. Barley the same. Sorghum is grown for home use alone. Fruit is about one-fourth of a crop owing to late frost. Limber Twigs and Never-fallers are the most successful apples in this section. J. A. C.

CHURCH HILL, Hawkins Co.—Wheat is an average crop; rust and drought have injured it. We do not make more than 15 bushels on our best land. Corn has suffered from the dry weather; on our upland we make 15 to 20 bushels to the acre; on our river bottoms we make 65 to 80; not much attention is given to the potato crop; scarcely any one plants over three bushels—enough for home use. The soil is well adapted to Irish and sweet potatoes. Of late years it has not been profitable to sow oats, particularly Spring oats. Our mild winters cause winter oats to yield better; of the latter kind we frequently make 25 bushels to the acre. As to barley and rye there is little or none raised in the county. Sorghum (Northern sugar-cane) is planted extensively, and yields well; every one has his patch; yet it is only grown for home consumption. I made 53 gallons of sirup from a quarter of an acre last year. The peach crop will be short in East Tennessee in consequence of frost; apples will be an average crop. But little attention is paid to fruit. We are 30 miles from Bristol and 20 from Rogersville, the nearest depot and county seat—altogether too far from market to make farming profitable. Land and property generally are lower than ever before J. G. A.

HOHENWALD, Lewis Co.—Four-fifths of the land in this county are wild lands—poor land, although covered with timber and grass. Wheat is one-third of a crop, hurt very much by rust. Prospect for corn is good for a full average crop. Potatoes, early ones, were hurt somewhat by drought; late ones are not all planted. Oats half a crop, damaged by rust. Of rye and barley none is raised. Sorghum is only raised for home consumption; it does well. Fruit prospects are good. Wild Goose and Chickasaw plums are ripe; so are Early Beatrice peaches, and June and Early Red Margaret apples. No pears are raised in this locality. Wild fruit is in abundance—blackberries, huckleberries and grapes. The most important crop in this county is corn. Peanuts come next; then wheat and cotton about the same; peanuts are the export cash crop. They yield from 40 to 60 bushels per acre, and bring more money into the county than all the rest of the crops. German Millet does well and an increased acreage is being sown this year. The acreage of wheat is less than that of peanuts, but more than last year. Other crops are about the same as usual. A. P. G.

North Carolina.

ASHEVILLE, Buncombe Co.—The wheat harvest will probably be an average one; the acreage was large but much was badly damaged by hail, and, later, by rust. There will be a light crop of peaches and a fair one of apples. Of apples, the Limber Twig has been largely grown for winter, but more attention is now being given to finer fruit, such as Camack's Sweet and Hoover, which succeed equally well. D. E. S.

MOORESVILLE, Iredell Co.—Wheat was an average acreage: but where not fertilized it will not exceed two-thirds of a crop; where it got guano it will be three-fourths of a crop to a full one. Fultz is the leading variety sown and is much the surest crop. The Clawson, Purple Straw, White Baltic and several other varieties are sown, but the Fultz will be almost entirely sown this fall. Corn is an average acreage and promises so far about an average yield. Corn is generally mixed. Gourd Seed and other varieties having been run together for years, there is now no name for the varieties. Cotton, I think, is 20 per cent. over an average acreage and fully two weeks ahead of any previous year since my recollection. Blooms are plentiful and for these the Fourth of July has been considered early. It is large and well worked out. At present it bids fair to be at least 25 per cent over last year's crop. Rye is very little grown here. Oats are not over one-third of a crop. Barley is not grown here. Potatoes—Irish—are an average crop; but they are not grown for market. Sweet potatoes with an average acreage, look well and promise a good crop. Clover on upland is rather short, probably 25 per cent. There is a full crop on lowlands. The fruit crop is short—not more than half a crop of apples and not over one-sixth of a crop of peaches. Small fruits, too, are as short as peaches, except blackberries which are a full and certain crop. All other fruit very uncertain. Fruit here is not raised much for market, but a good deal more attention has been paid to it of late. Late frosts in Spring, however, are very discouraging to the business. S. A. L.

South Carolina.

CHAPPELL'S BRIDGE, Newberry Co.—Wheat all most a total failure from fly, rust and drought. Oats an unusually good average—12 bushels per acre. Barley is damaged badly by rust. Cotton looks well, but small; can't tell the average of it until binned. Corn is suffering from dry weather. Half crop of peaches in some places but with me, none. Apples plentiful. H.

Georgia.

ATLANTA, Fulton Co.—Wheat is all harvested and is about 60 per cent. of a full crop, being reduced by rust. Corn promises a full crop; an average acreage is planted. Cotton promises a full crop; acreage 20 per cent. larger than last year. Potatoes a full crop, what had not been killed by late frosts. Oats a full crop; and acreage 30 per cent larger than last year. Rye but little planted; it is, however, good. Barley, ditto. Fruits are on the whole a failure, killed by late frosts. Strawberries yielded well and continued from April 17th to June 20th. C. D.

Florida.

STARKE, Bradford Co.—No wheat, rye or barley is raised here. I don't think there is much of either raised anywhere in the State. Rust-proof oats are grown here to a small extent, but the crop was almost an entire failure this season. Yellow Dent corn is the variety most raised—not an average crop. The long staple Sea Island cotton is raised altogether here. The prospect is fine for a good crop now, but it is too soon to judge. The cotton worm may come and destroy half of it, as it did last year. Only Sweet potatoes are raised, except a few Irish; in Winter several varieties are planted—white and red West Indian and Providence potatoes, which grow to a great size. There is also a large red potato called Nigger Killer, not very sweet, but dry and mealy like an Irish potato, besides several kinds of yams. There is a good deal of sugar cane and rice, much more of the latter than ever before. The acreage of cotton is about 10 per cent. larger than last year. Peaches, plums, pears, quinces, and figs have been total failures this season. Peaches have always been raised in great quantities, but many of the trees have died during the Spring, and the young trees do not grow, and it is just the same with quinces. Fig trees have not leaved out well, and the fruit that sets does not perfect itself as usual. Many attribute the drawback to the very warm weather last Winter. No strawberries are raised here except for home use. The Charles Downing has proved the best variety for us. We have had fruit from the same vines six months right along. Of course the orange is the most successful fruit raised here, although we can grow many kinds of tropical fruits by giving them a little protection in Winter. The yield of oranges from old trees will be, in this locality, about two-thirds as heavy as last year, but the young trees coming into bearing may bring the number up to the same amount. The quality of the fruit promises to be far better. There are very few lemons and limes in bearing here, but many young trees. We have had very dry weather, much too dry for sugar cane and rice; but on June 25 we had a fine rain, giving farmers a chance to set Sweet potato vines. The young orange trees look remarkably well and are growing very rapidly. J. S.

Alabama.

BIRMINGHAM, Jefferson Co.—The wheat crop is a failure in this part of the South, caused by rust. Cotton looks very well now, and a large area has been planted. Oats were light owing to the rust. Irish potatoes are fine; the Early Rose and Peerless do the best. The fruit crop will be light, the Early Amsden, Alexander, Louise and Beatrice peaches do the best. The Early Amsden has been selling in this market since the first of June at $6.00 per bushel—the prices in Northern cities to which we ship are still higher. The strawberries never fail here and lasted this season for ten weeks. Wilson and Charles Downing are the most profitable, as the plants and fruit stand the sun. The Sharpless does the best of the new varieties. C. H. R.

CITRONELLE, Mobile Co.—No wheat, no cotton and not much corn is grown in this locality. Peerless seems to be the favorite potato; 150 to 200 barrels were shipped from here this season. Bad weather and worms cut the crop down a quarter or a half. No rye; no barley. Oats are grown for home use for forage; no seed is saved. There are a few pears but no peaches at all this season. Our very mild Winter, with occasional cold snaps in March, frequently cut the peach crop short, though never before have I known of a total failure. The Louise and Beatrice for early and Crawford's Late appear to be the most profitable varieties to raise. Land in peaches about 50 to 60 per cent. This is a high, pine wood country much resorted to by invalids for its light, dry, pure atmosphere. J. W. M.

NEW MARKET, Madison Co.—Wheat one-half a crop. Corn will be a full crop, Cotton looks fine. Potatoes, Irish, a full crop; sweet very promising. Rye, oats and barley good. Wheat, Boughton, Early May; cotton, Green Seed; potatoes, Early Rose, Peerless, Bruce Red, London Lady; sweet, Yellow Yam, Southern Queen, Spanish, etc., etc.; oats, Rust-proof, Mold's Ennobled is magnificent though late. Rye, common. No Barley. The acreage of all is much larger than usual. Fruit of all kinds in profusion. Apples, Early May, Juneating, Early Harvest, Shockley, Ben Davis, Penn. Cider, Romanite, Winesap, Limber Twig, Horse, and almost all Southern seedlings. This is the natural home of the peach; all varieties thrive here. Plums all kinds. Strawberries, Miner's Prolific, Sharpless, Wilson's Albany, Monarch, etc, etc. Raspberries, Herstine, Cuthbert, Turner, Mammoth Cluster, Pride-of-the-Hudson, Gregg, etc. Gooseberries, Houghton's Seedling. Grapes, Concord, Delaware, Salom, etc., etc. G. D. N.

YELLOW BLUFF, Wilcox Co.—The prospects for the present harvest are not favorable. Corn will be below the average; cotton about an average; of the former there will be only about 10 bushels per acre; of the latter about 500 pounds in seed to the acre. The oat crop has already been harvested and the yield was above an average. Notwithstanding that rust prevailed to a greator extent than for years, the average saved from all reverses was about 25 bushels per acre. Irish potatoes have proven a good average yield—say about 100 bushels per acre. We are just planting sweet potatoes, and the outlook promises a heavy yield—far above the average, say 200 bushels per acre. The acreage under cotton is largely in excess of some years; that of corn is about the average for five years previous. There are about four acres of cotton to one of corn. Potatoes of all varieties are grown almost solely for home consumption, and the acreage therefore is small. The fruit prospects are very poor; in fact, apples and peaches have failed almost entirely. Figs, pears, grapes, melons and the wild berries that seldom fail promise an abundant yield. The most successful varieties in this locality are of the peach, the seedlings that ripen from 1st July to October; of the apple, the native "Horse," the red and yellow Junes and the Winter Russet; of pears, the standards; dwarfs of all varieties do not succeed here. Buying trees from nurseries, where any material difference of latitude exists, will eventually become a custom of the past. Forest fruits promise a moderate yield. The uniformly warm winter caused many of the fruit trees to "put out" in December, and the heavy frosts during the holidays destroyed nearly all the peaches. W. B. S.

Arkansas.

BEEBE, White Co.—It was very warm for ten weeks until June 26, when we had a fine rain, which still continues. Rye will be a quart to a crop. Wheat did not pay to cut. Oats about half a crop. The late rains will help the corn in some places but not in others. It will not be over half a crop. We shall have to import a good deal. Cotton is looking very well. A great many did not cut their oats. Some say all the rain cannot help their corn. Now I do not know what the farmers are going to do here. The merchants' prices are: third and fourth grade flour, $7 cash, or $9.50 on time; corn meal, per barrel, $3 cash, or $5 on time. The farmers lost all their meat last winter; on account of the warm weather it did not cure—that is, hams and shoulders. A great deal of meat sold here comes from the North. They say this is a good poor man's country. I believe it, for even a man with some means gets so poor he has to stay—cannot get away. I never worked so hard in my life as I have done here, and yet I have mighty little to show for it. It is no place for any kind of stock. I brought good horses, cows, hogs and chickens with me—such horses and hogs! Folks here would pay for them only the same price as for scrub stock. I told them my price and they did not trouble me any more. This is a very good place for fruits for the Northern markets, and when I have said that, and put in a good word for the climate, I have said all the good of it I can honestly say. H. B.

LITTLE ROCK, Pulaski Co.—Cotton is the leading crop here and the prospect is good for a heavy crop; a very large acreage is planted. People are beginning to take considerable interest in fruit-growing. Fruit shipped from here to St. Louis brings a high price, and the home market is good. All kinds of fruit do well here except apples; these I think would thrive if people would select varieties adapted to the country. Strawberries do well and sell at high figures. The Wilson is the leading kind. Cumberland Triumph does well and sells high in the home market, but it is too soft to ship. The Charles Downing stands heat and drought better than any other out of over 50 varieties I have on trial. The Sharpless promises well; it is not fully tested yet. The Crescent Seedling promises very well. Peaches do well and command a good price, both shipped and in the home market; so do apricots and plums, pears, and in fact, all kinds of fruit. Corn looks well. Not much wheat and oats are raised near to Little Rock. W. G.

Mississippi.

TOOMSUBA, Lauderdale Co.—Corn is at least 10 per cent. less in acreage than last year, and will average about 10 bushels per acre of Western white and yellow. Wheat, none. Cotton 10 per cent. more than usual planted, and will average over 300 pounds of seed-cotton per acre. Potatoes, mixed hardy kinds, Red, Yams, Spanish, &c., five per cent. more in acreage; average, 80 bushels per acre. Oats are a perfect failure, except rust-proofs. Mold's "Ennobled" took rust and I saved not one grain. Rye and barley not planted fruit badly winter-blighted, none good, and we shall have small crops, except of plums, which are in abundance, and good. Berries sorry, except blackberries. Grapes badly blighted and rotting. Scuppernong the best. J. D. H.

Louisiana.

MONROE, Ouachita Co.—The corn prospect is good; the best for several years. No wheat, oats, rye or barley sufficient to be accounted a crop, is planted. Irish potatoes are only planted for family use; a splendid crop this year. Sweet potatoes are doing well. So is cotton, the principal crop here. The cotton-worm has appeared in several parts of the parish, and will, probably, injure late cotton. Acreage in cotton about the same as last year. In corn there is a slight increase. Rain needed in some parts of the parish, and too abundant in others. Crops well in hand as to cultivation. G.

Texas.

ROUND ROCK, Williamson Co.—Corn is fine and in roasting ear. Wheat, both Spring and Winter almost a total failure. Oats very good, but blown down and damaged by wet weather, and selling at 20 cents per bushel. Early cotton looks well, but many have late cotton having been compelled to plant the second and some even the third time the former plantings have been destroyed by the worm. The Irish potato crop is good. The Sweet potato crop is expected to be good from prospects. J. F. C.

WACO, McLennon Co.—The wheat is a fair average. Corn will be immense—more raised than ever before. The prospects for cotton are very fine. Oats about half a crop. Of rye none is sown. Potatoes about an average. Barley none sown. As to varieties, Mediterranean for wheat, Early Rose for potatoes and Red oats. The acreage in all is greater than ever before. We shall have an abundance of everything. A. S. S.

Canada.

FERNHILL, Ontario.—Our Spring was very dry and this is making our hay crop very late, and some of it very thin, but we have had plenty of rain since the middle of May, and this has brought it up to about an average crop. Fall wheat is looking extra-good and is very nearly ripe; Clawson looked the best in the first part of the season: but the rust seemed to take a better hold of it than of the rest. Scott wheat looks excellent, with its short straw and bald head. Michigan Premium is doing excellently; it is a beautiful white wheat with long straw and large, bald head; it is later than the Scott which is an extra-early variety. Spring wheat is a complete failure this year. A great many tried a new variety but it proved no better than the rest; luckily there was very little of any kind sown. Oats and barley look well, there was a very small amount of peas sown here this year on account of the bugs. Corn and potatoes look very good and from all appearances they will be very good crops. J. M. W.

PROSPECT HILL, Ont.—In this township we have not had such a prospect of a bountiful harvest for many a year, and in the adjoining townships, Blanshard, Nissoura, London, Lobo, Osborne, McGilvary the outlook is as good, if not better. The principal wheat is Clawson. There are several other varieties, but we depend more on the Clawson than on the others. Oats are an average crop. Clover and Timothy, owing to the timely rain, will be a fair crop. Of peas none are grown in this section except two acres by my neighbor, who got the seed late and, strange to say, not a bug was in them. Apples will be a fair crop, although this is the "off" year. Not many pears are grown in this section. Strawberries are an abundant crop. We had the first berries the first of June and owing to the occasional showers we had, the vines will bear probably until the tenth of July. I sold the first picking for 20 cents per quart, then for 18, 16, 14 cents. Just now they are selling at 12 cents. This will be the lowest price. J. L.

Rational Treatment, Positive Cures.

Dr. R. V. Pierce, President of the World's Dispensary Medical Association, is in earnest in selling his medicines under positive guarantees, and if anybody who purchases and uses any of these widely celebrated remedies, does not derive benefit therefrom, the Association would like to hear from that person with description of symptoms and history of case. Organized and incorporated, as the association is, to teach medicine and surgery and for the successful treatment of all chronic diseases and managing annually thousands of cases through our original method of diagnosis without ever seeing the patients, and having also the largest sanitarium in the world for the accommodation of the more complicated cases, and also for surgical cases, the Faculty feel themselves prepared to undertake even the most discouraging cases. They resort to all the best remedial means known to modern medical science — neglecting nothing. Address, World's Dispensary Medical Association, Buffalo, N. Y., or Great Russell Street Buildings, London, Eng.

Chambers's Encyclopædia.

Volume X of this great work which is being advertised complete in 15 vols., over 13,000 pages, for the marvelously low price of $6.25 (if ordered during this month) is now being delivered to subscribers, and volume XI will be ready in a few days. The "Literary Revolution" which brings works of such superlative excellence within reach of the masses, well deserves the great popular favor it is receiving. Catalogues of the many standard publications of the American Book Exchange, Tribune Building, New York, will be sent free on application to them.

Write to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for names of ladies that have been restored to perfect health by the use of her VEGETABLE COMPOUND. It is a positive cure for the most stubborn cases of female weakness.

You Must Try It.

Do not despair, even if you have suffered for years from weak kidneys and torpid bowel. The celebrated Kidney-Wort has cured hundreds of from five to thirty years standing. It is nature's great remedy.

Burnetts' Cologne is prepared from the purest and best materials, and is unrivaled in richness and delicacy of perfume.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 3, 1880.

Commerce has been largely pushed aside this week. The principal exchanges closed on Friday evening and as the intention to close was announced early many merchants suspended operations to an extent that makes the week almost a blank one. There will be no recovery of activity until several days after the Fourth, and our annexed quotations for commodities depending upon wholesale outlet must be regarded nominal. Fruits and other tender produce will depend upon the chances of catch trade for the time, and if supplies are at all liberal weak prices will rule.

BEANS AND PEAS.—The movement is light in beans for local and export use.

Marrow beans, fair to prime, $1.45@1.57½; medium $1.20@1.35; pea $1.40@1.65; white kidney, $1.50@1.75; red kidney, $1.30@1.45; black or turtle soup $2.20@2.25; Lima, Cal., $5. Peas quiet; green peas $1.55@1.60; Southern: B. E. pea $1.70@1.80 per 2 bu. bag.

BROOM CORN.—The supply is wearing down at former prices. Brush and short broom, choice, per lb., 7@8c.; common to good, 5@6½c., hurl, good to choice, 7@8c.; do., common to fair, 5½@6½c.; red and crooked at 3@4c.

BUTTER.—For strictly fancy butter the market has ruled a shade above annexed rates, but for real wholesale business last week's rates almost cover the current rates. State stock leads all trade and Western factory and dairy are not sold up clean.

Creamery, finest, 20@22c.; good to prime, 19@19½c.; fair to good, 18@19c.; sweet cream, fine, 20c.; sweet cream, fair to prime, 18@19c.; firkins, choice yellow, 20@21c.; fair to prime, 18@20c.; pails and hf. tubs, choice, 19@20c.; good to prime, 18@19c.; fair to good, 17@18c.; poor, 14@16c.; Welsh tubs, prime, 18@19c; fair to good, 17@18c.; poor, 14@16c.; Western imitation creamery, 14@17c; dairy, fresh, extra, 16@17c.; good to prime, 15@16c.; fair to good, 14@15c.; poor to fair, 13@14c.; factory, full grass, fine, 16c.; good to prime, 13½@14½c.; fair to good, 13@13½c.; poor to fair, 12@13c.

Receipts for week, 41,240 pkgs.

BEESWAX.—The home trade only is paying 23@25c.

CHEESE.—The market has not come out of its sick condition to any satisfactory degree. Still, with an improved cable and less reduction on the part of shippers there is a brighter outlook. Liverpool cable, 51s.

Following are nominal quotations for State factory, fancy, 8¾@8c.; do. good to prime, 8@8½c.; do. fair to good, 7@8c.; do. half skimmed, 5½@6½c.; Wisconsin factory, fine, 8¼c., do. good to prime, 7@8¼c.; do. fair to good, 6½@7c.; Ohio factory, fine, 8@8½c.; do. good to prime, 7½@8c.; do. flat, fair to good, 6¾@7¼c.; do, poor to fair, 5½@6½c.

Receipts for week, 70,611 boxes.

COTTON.—There is little speculative demand. For spining purposes the call is fair at following table of rates:

	Uplands.	N. Orleans and Gulf.	Texas.
Ordinary	8 7-16	8 7-16	8 7-16
Strict ordinary	8 15-16	9 1-16	9 1-16
Good ordinary	9 15-16	10 1-16	10 1-16
Strict good do.	10 7-16	10 9-16	10 9-16
Low middling	11 3-16	11 5-16	11 5-16
Strict low middling	11 9-16	11 11-16	11 11-16
Middling	11 13-16	11 15-16	11 15-16
Good middling	12 5 16	12 7-16	12 7-16
Strict good middling	12 9-16	12 11-16	12 11-16
Middling Fair	13 1-16	13 3-16	13 3-16
Fair	13 11-16	13 13-16	13 13-16

STAINED.

Good ordinary	8 1-16	Low middling	8 9-16
Strict good ordinary	8 15-16	Middling	10⅜

DRIED FRUITS.—The market at this season is without special interest, and nominal quotations only can be given.

For North Carolina apples, fair to good, at 6½@7¼c.; choice, at 8@8¼c.; New York State quarters at 7½@7¾c.; patent evaporated, in cases, choice at 14@14½c.; good and prime 13½@14c.; evaporated, sliced at ——c. Evaporated peeled peaches, good to choice, at 26@28c.; North Carolina peeled choice,

16@17c.; Georgia prime at 15@16c.; fair to good at 13@14c.; common at 10@12c.; unpeeled halves at ——c.; do. quarters at 6@6½c. Pitted cherries at 16@17c. Blackberries nominal. Raspberries at 28c. Plums at 17@17½c.

EGGS.—Receipts for week, 8,890 bbls. The market is dull and weak; it does not even show the extra spurt that usually attends Fourth of July week. All stock quoted only to what it will stand.

L. I., N. J. and near by, 14½@15c.; State and Penn., 13½c.; Western, choice, 11½@12c.; Western, fair to good, 11c.; Canada, good to choice, 12@12½c.

FEATHERS.—Geese, prime, 50@55c.; mixed, 35@45c.; hen, ——@——c.; turkey, 2@4c.

FLOUR.—The decline in wheat which has resulted from the good crop reports from all sections west has brought about a decidedly lower range of prices for flour; a larger export trade results.

The quotations are $3.15@4.00 for inferior to very fancy superfine State and Western; $3.70@4.00 for poor to very good extra State, odd lots and lines; $4 00 @4.25 for very good to fancy do.; $3.70@4.00 for inferior to very good shipping extra Western, and $4@ 4.25 for good to fancy shipping extra do.; inferior to very good white wheat extras, $4.35@5.25; very good to very choice do. at $5.25@6.50; red and amber winter wheat, inferior to choice trade and family at $4.40@5 85; round hoop Ohio, $3.90@4 40; and trade and family brands of do. at $4.50@5.75; St. Louis at $4.40@5.35 for inferior to good extra; $5.35@6.50 for good to very choice, and up to $6.00 for very fancy. Minnesota clear, very inferior to fancy, at $3.75@5.75; Minnesota "straight," very poor to very fancy, at $5.10@7.25, and patent inferior to fancy at $5.50@8.00; unsound stock at from $2.25@5 00; city mill extra at $5.40@5.75 for good to choice West Indies; do. for England, $3.75@4.35 for poor to very choice spring wheat, and $5 @5.50 for winter wheat product; do. trade and family extras, $6.00@6.75; do. for South America, $5.75@6.15; No 2 at $2.25@3.00 for poor to very choice. Southern flour held firmly, with only a moderate demand; sales at 600 bbls.; quoted at $5@6 75 for poor to very choice extras. Rye flour is moderately sought after; sales of 350 bbls. $4 50@4.80 for fair to choice superfine State.

CORN MEAL.—In better demand, with prices steady; sales of Brandywine at $3.15, and 200 bbls. yellow Western at 2.50@2.75. Yellow Western quoted at $2.50@2.75; some fancy lots at $3; Brandywine at $3.15. Bag meal quoted at 91c, for ordinary city coarse.

FRESH FRUITS.—Strawberries are almost gone; quality now poor. Other berries have a steady sale but in all fruits it depends upon a well attended market in the morning for steady prices to be quoted. Apples in good demand when of fair size. A better display of peaches is offering.

Strawberries Oswego ₱ qt. 5@8c; Raspberries Red Antwerp cups 6@7c.; up-river, native, cups 3@4c.; Jersey red, pts. 6@9c. Blackcaps pts. 4@5c.; Md. & S. Jersey, ₱ qt. 6@8c. Whortleberries Mountain ₱ bu. $3@4; Jersey ₱ bu$3. Md. ₱qt. 8@10c. Blackberries Wilson, Md. & Del. ₱ qt. 8@10c.; Dorchester, Md. & Del. 6@8c.; Jersey, Wilsons ₱ qt. 10@12c, Currants cherry, ₱ lb 6@8c.; small ₱ lb 4@5c. choice sweet ₱ lb 10@12c., sour ₱ lb 8@10c.; common 5@6c. Gooseberries green, Md. ₱ bush. $1.50. Plums, Mountains Md. ₱ qt. 4@5c. Apples Md. Astrachan, per cr. $1@1.25; Md. green per cr. 50@75c.; North. green ₱ bbl. $2@3: do. ₱ ½ bbl. $1.00@1 50, Peaches, N. C. choice ₱ cr. $3@4: do. poor to fair 75c.@$1; Ga. $3@4; Norfolk 75c.@$1 50; Md. & Del. Beatrice 75c.@$1.50 Apricots ₱ qt. 20@25c. Watermelons Fla. per 100 $10@25; Ga., $15@25; Fla. Hickory nuts per bush. $1@1.10. Peanuts, Va. hand-picked, ₱ lb. 5½@5½c.; extra prime to fancy 4½@4½c.; good to prime 4½c.; shelled, 5½@5½c.

GRAIN.—The arrivals have been the largest ever known in this market of wheat and corn, and extensive operations have resulted in export account. The shipment of corn have been especially heavy and in one day over 500,000 bush. went to the English markets. Prices have been steadily declining throughout as the weather has been favorable for the crops. Sales on the spot, including No. 2 red winter at $1.15@1.15; ungraded do. $1.11@1.14; No. 1 white at $1.12½@1.14½; No. 2 do. $1.11@1.11½; ungraded white at $1.08@1.12, and No. spring $1.07@ 1.08; and for future delivery. No. 2 red winter at $1.14@1.15 early in July $1.11½@1.15 for all July; $1.07 @1.09 for August, and $1.07½@1.08½ for September.; No. 1 white at $1 09½@1.10 for July, and $1.07@1.07½ for September; No. 2 Milwaukee at $1.07 early in July and $1.05 for all July. Indian corn on the spot at 46½@50½c. for Western mixed, including No. 2 at 50@50½c, steamer do. 48½@48½c, and fair Western yellow, and for future delivery including No. 2 mixed at 48½@48½c. for July, and 48½c. for August. Rye unsettled; Western reported sold for August delivery at 76c. Oats on the spot at 32@35½c. for mixed, and 33@40c. for white, including No. 2 graded at 34½@35c. for mixed, and 35@35½c. for white. No. 2 mixed for July 34½@35c.

HAY AND STRAW.—In this section of the State and in New Jersey the hay crop is a hopeless one. If the scarcity proves to be what is feared, it will be a serious event for the trade. Poor hay will not fill New York's demand in hardly any case. Exporters and stables that formerly took rejections find it more profitable to raise their view of quality. This tendency to keep down the offerings of good, to prime beyond a storing degree. On many days during the week the stations and barges have sold out all good stock upon arrival. The market closes very firm for both hay and straw.

Fancy wire-baled J. C. hay $1.05 per 100 lbs.; prime timothy 95c.@$1; medium 85@90c; shipping 70@80c; clover 60@70c.; long rye straw $1.10@1.15; short 70@75c; oat 45@50c.

HOPS.—There is merely a brewers' demand, and the call is light at this part of the season. The quotations are for:

	Cents per lb.
New York, fancy	Nominal
New York, new crop, good and choice	33 @36
New York, new crop, medium	31 @33
New York, new crop, low to fair	27 @29
Eastern, new crop	27 @33
Wisconsin, new crop	27 @35
Yearlings	7 @18
Olds, all growths	4 @10
Pacific Coast, new	30 @35
Pacific Coast olds (nominal)	5 @10

POULTRY AND GAME.—Dressed poultry is not plenty, and as the demand is sharper for fresh dressed stock than country picked, strong prices rule.

Spring chickens, ₱ lb., 20@22c.; fowls, Pa. and Jersey, 12½@13c.; State, 12½@13c.; Western, 12@12½c.; Southern, 11@12c.; roosters, 5@6c.; turkeys, ₱ lb, 11@ 12c.; ducks, State, Pa. and N. J., ₱ pair, 45@55c.; Southern Pa., ₱ pair, 45@55c.; Western, ₱ pair, 45@55c.; geese, Western, $1.12@1.25; State, Pa. and Jersey, ₱ pair, $1.25@1.50.

There is a good supply of dressed, and prices rather favor buyers even for fine dry-picked.

Turkeys, small, choice, 13@14c.; large, 11@12c.; chickens, Phila., large, 30@32c.; small, 25@28c.; Jersey, 24@25c.; State, 23@25c.; Western, 18@21c.; Pa., dry-picked, 23@25c.; Fowls, Bucks Co. and N. J. prime, 14@15c.; L. I. and N. J., fair to good, 12½@13c.; Phila., dry-picked, prime, 14@15c., State and Western, dry-picked, 13@14c.; sea duck, 12@13c.; fair to good, ₱ lb., 11@12c.; spring ducks, ₱ lb., 18@22c,

Supplies of game are small, English snipe only brought from ice-houses as wanted. There is no call for heavy receipts of any sort, as spring chickens now fill up much of the fancy trade.

Wild pigeons, flights, ₱ doz., 75c.@$1; stall-fed, $1.50@1.75, tame squab, light, ₱ doz. $2@2.25; dark, $1.25@1.50; pigeons, live, ₱ pair, 30@40c.; shot pigeons per doz., $1.12@1.25; frozen English snipe, ₱ doz., $2.50 frog's hind legs, large, ₱ lb, 25@25c.; small, 18@ 20c.

PROVISIONS.—Hog products have been in very good shape this week, as some of the larger speculative operators have got out, and with the legitimate export trade working as an influence, prices have gone to a better basis. Quotations for pork: old mess at $11.75@12; new, $12.00@12.25; 30 lbs. family mess, $13.25; for future delivery sales, Aug., $12.15; seller the year, $11; July quoted at $11.90@$13.25; Sept., $12.15@12.40; Oct., $12.20@12.55 bid and asked. Lard was also stronger, with a moderate trade; prime city, 7.05c; 4.50 tcs. do., Western, 7½@7.15c.; for future delivery, July, 7.10c; Aug., 7.12@7.17½c.; Sept., 7.22@7.25c.; Oct., 7.27½@7.30; seller year quoted 7.10c; refined to the Continent, 7.55c. Bacon was dull and nominally unchanged. Cut meats ruled quiet and unchanged; sales 1,000 pickled shoulders, 5¾c. The stock of pork here and in Brooklyn warehouses is 54 477 bbls.; and in lard 62,630 tcs. Beef and beef hams nominally unchanged.

SEED.—Linseed is dull and nominal. Timothy is quiet. Clover has a small demand; quoted at 7@7¼c. for choice Western; 7¼c. for extra choice do., and 7⅛ @7⅜c. for choice New York State.

TOBACCO.—The following is a late revision of price for domestic.

KENTUCKY LEAF.

	Light.	Heavy
Common lugs	4 @ 4½	4½@ 4⅝
Good lugs	4½@ 5	5 @ 5½
Low leaf	5½@ 6	6 @ 6½
Medium leaf	6½@ 7	7 @ 8½
Good leaf	7½@ 8½	9 @10½
Fine leaf	9 @11	11 @12

Wrappers	12 @18	— @—

MANUFACTURED TOBACCO.

A moderate business has been done in all styles We quote:

Black work—Common and medium, in bond	12 @15
Good and fine, in bond	16 @18
Bright work—Common and medium, in bond	15 @19
Good and fine, in bond	21 @35

VEGETABLES.—The market is easy for new potatoes; supplies begin to arrive from near points. Old are lower and pressed for sale.

Bermuda, ₱ bbl. $5; Long Island, new, $2@2.50; Norfolk, $1.25@2.25; Maryland, $1.25@2.25; Southern culls, 50@75c.; Early Rose, Maine, per 6-bush. bbl., $1; State, 50@75c.; peachblow, State, $1; Snowflake, $1; Peerless, 50@75c. There is a good demand for fresh garden stuff, but the weather is so warm that distributors will not take large lots and the moderate arrivals fill all present wants. String beans, L. I. ₱ bag, flat, 75@$1.50; cucumbers, Norf., 50@75c. L. I., ₱ 100, $1; green peas, L. I., per bag, $1@2; Tomatoes, Nyrt., $1@1.50; Fla ₱ bush. box, $1@1.50; Cha's. and Sav., $1@1 50 beets Jersey, per 100 bunches, $2@2.50; onions, Bermuda, ₱ crate, $1.50; Md., ₱ bbl., $3.50@ 3.75; cabbage, L. I. and Jersey, ₱ 100; squash, white, L. I., ₱ basket, 40@50c.; white turnips, Jersey, ₱ 100 bunches, $2@3; cauliflower, L. I., ₱ doz, 75c.@$3; eggs plant per cr., $1.50@2; turnips, Russia, ₱ bbl., $1.50@1 75; sweet corn, ₱ 100, $1.

WOOL.—There no is change to note. Few buyers likely to be in market until receipts make a larger stock than is now showing.

LIVE STOCK MARKETS

NEW YORK, Saturday July 3, 1880.

BEEVES.—Butchers' wants were limited this week with the holiday in view, and prices were tame at the close though off 4c. since Wednesday. Good Texan steers sold at 7c., to dress, 55 lbs.; fair to prime native steers, 8¾@9¾c.

COWS AND CALVES.—There have been a few car loads of State sold at 22@50c.; a few extras, $55 per head.

VEAL CALVES.—Demand steady; supplies sufficient to keep prices popular. A few near-point dressed 7@8c.

Live calves, N. J. and Bucks Co., choice, 5¾@6c.; fair to choice, 5¼@6c.; State, prime, ₱ lb, 5¼@5¾c.; do, fair to good, 4½@5c.; fed, 2¾@3½c.; buttermilk, 1⅝ @2⅛c.

SHEEP AND LAMBS.—The tone of the market is firm and as prices are not above buyers' views a good clearing of the pens is to be noted.

Sheep 3½@5c. Southern and Western lambs 4½@ 6¼c.; N. J, 6¾@8½c.

SWINE.—No public sales; city dressed firm, unchanged at 5¾@6¾c.

Literary Miscellany.

THE SONG OF THE SOWER.

THE farmer stood at the open door,
Looked north, and south, and east, and west,
"Good wife, the swallows are back once more,
Back again to their last year's nest.
I'm off to the fields to speed the plow,
The birds are singing on every bough.

"The skies are dreaming of summer blue:
Trees are dreaming of rustling leaves;
And I have a dream—God make it true!—
Of standing corn, and of golden sheaves,
Of meadows green, and of new-made hay,
And reapers singing at dawn of day.

"Call all the boys; we must go a-field,
To speed the plow and cast the seed;
God bless the seed, and make it to yield
Plenty, both man and beast to feed!
God bless the seed, and speed the plow,
For birds are singing on every bough."

Then out with his boys the farmer went,
Into the fields the soft spring morn,
Sowing the seed with a glad content,
Singing, while sowing the good seed-corn,
"God bless the harrow, and bless the plow,
The corn, the wheat, and the barley mow!"

RESULT FROM MISTAKE.

CHAPTER III.

WHEN Frank Drayton once made a decision he was never very long before he acted upon it, and the present instance was no exception to the rule, for in half an hour he was on his way to the office of Messrs. Seton & Co.

His acquaintance with Mr. Seton was only slight; but he knew him by repute as a keen, hard-headed man of business; and the more he pondered over the nature of his errand the more his conviction deepened that he was almost certain to give him a sharp denial.

And most assuredly it would have proved correct, had it not been for the services of an intercessor of whose good offices in his favor he was not aware.

This was no other than Mrs. Seton, who seeing, how her daughter's happiness was involved, had exercised all her persuasive power on Frank's behalf. Her task had not been an easy one, but at length she had been successful in overcoming her husband's opposition.

Contrary, then, to Frank's anticipation Mr. Seton received him with considerable cordiality.

"I have been prepared for this visit, Mr. Drayton," he said, "and I hasten to mention it, because it seems likely to do away with a good deal of explanation. I tell you, frankly, that I had looked forward to an entirely different future for my daughter. But we will say no more about that. My chief aim in life now is to do all I can to secure my daughter's happiness, and to prove to you I am in earnest I have consented to set aside all my plans. The inquiries I have made about you have been thoroughly satisfactory, and therefore I give a full and unconditional consent to your request. Take her," he added, pressing the young man's hand; "she is yours. May you both be happy!"

After this, what was there for Frank to do but to express his thanks and obligations to Mr Seton? Nothing. He got through the awkward task somehow, but in what manner he never had a clear recollection.

"We shall be very much pleased to see you at dinner this evening," said Mr. Seton at parting. "May we expect you?"

Frank could only renew his thanks, and protest that he should be most happy.

"That chance of getting out of my difficulty is at an end," he muttered, as he strode hastily down the street. "How contrarily events turn out! Had I been really in love with Miss Seton, her father would doubtless have been violently opposed to our union. Now, because I wished him to refuse me, he receives me with open arms; and so far from having extricated myself, I have only become entangled more hopelessly! To escape now seems impossible."

That same afternoon Kate Seton, her eyes glowing with happiness, was standing near the drawing-room window waiting for her lover. Poor girl! how little did she dream that her joy had no other beginning, no firmer foundation, than a mistake!

She knew already that her father's objections had been overcome. A future of felicity seemed to lay all before her. And when, later on in the evening Frank pressed her lips with a betrothal kiss, and slipped an engagement-ring upon her finger, she as little guessed the real nature of his feelings. Her intense fondness for him blinded her to the fact that his general bearing towards her was embarrassed and constrained.

"Dear Frank," said Kate, glancing shyly, yet how sweetly, into the face of her betrothed, "how strange it seems that you, having all the world to choose from, should make me the object of your love! You will never know the happiness your letter gave me—never! For—why should I keep the secret from you? I have always loved you, even before you had ever spoken to me; and I could think of no greater earthly bliss than to be your choice—your wife!"

"And do you know," she went on, softly, "I learned to-day that I have been so near to losing you? Mrs. Challon told me when she called that your cousin, Kate Barton, was engaged, and that——"

"What? Why do you pause?" asked Frank, with nervous impatience.

"I do not know whether I ought to tell you; but, after all, what can it matter now? Mrs. Challon is your cousin's most intimate friend, and she told me, in strict confidence you understand, that Miss Barton had had two strings to her bow in other words, two lovers—that she liked them both, and so played one off against the other, with the determination of accepting the one who first made her an offer."

"Indeed!" ejaculated Frank, who, as his companion paused, felt it incumbent upon him to say something.

"You will understand it was Mr. Brown who spoke first, but he was accepted with reluctance; Miss Barton's preference was for the other. Now can you tell who that other was?"

"I?—no—no—why?" stammered Frank.

"Yourself!" laughed Kate, softly; "no other than yourself! Of course I did not tell Mrs. Challon how well I knew it was all a mistake on your cousin's part, and that you had loved me—only me; though I can easily understand that she would prefer you to that odious little fellow, Horace Brown."

Her words and manner showed how implicit was the trust reposed in her lover, and this confidence that she and she only had a place in his affections, touched him to the heart.—To be continued.

CURIOUS FACTS ABOUT MEMORY.

A FRENCH scientist has been studying the faculty of memoy as exhibited by the different races, and its relation to the other mental faculties, as shown in individuals of the same race. His statements are interesting:

The inferior races of mankind, such as negroes, the Chinese, etc., have more memory than those of a high type of civilization.

Primitive races which were unacquainted with the art of writing had a wonderful memory, and were for ages in the habit of handing down, from one generation to another, hymns as voluminous as the Bible.

Prompters and professors of declamation know that women have more memory than men. French women will learn a foreign language quicker than their husbands.

Youths have more memory than adults. It is well developed in children, attains its maximum about the fourteenth or fifteenth year, and then decreases.

Feeble individuals of a lymphatic temperament have more memory than the strong. Students who obtain the prize for memory and recitation chiefly belong to the former class.

Parisian students have also less memory than those who come from the provinces. At the Ecole Normale and other schools the pupils who have the best memory are not the most intelligent.

The memory is more developed among the peasantry than among citizens, and among the clergy than among the laity.

From a physiological point of view, memory is diminished by over-feeding, by physical exercise and by education, in this sense, that the illiterate have potentially more memory than those who know how to read and write.

We remember, moreover, better in the morning than in the evening, in the summer than in the winter, and better in warm than in cold climates.

VARIETIES.

JOSH BILLINGS is sixty-three years old, and has made from his writings 105,000 dollars.

Holmes and Whittier are of the same age. Holmes is seventy, and Whittier is seventy too.

LAMP shades of ground glass should be cleaned with soap or pearlash; these will not injure or discolor them.

There is a Latin term for cod-liver oil, but none for the taste of it. The Latin races were not well up in profanity.

There was Paganini the fiddleist, and here's Campanini the tenor. Rather singular how many ninnies got into the musical ranks.

They who have experienced sorrow are the most capable of appreciating joy; so, those only who have been sick feel the full value of health.

A good man, who has seen much of the world and is not tired of it says: "The grand essentials to happiness in this life are—something to do, something to love, and something to hope for."

Of the discoverers and conquerors of the New World, Columbus died broken-hearted, Roldin and Bobadilla were drowned, Balboa was beheaded, Cortez was dishonored, and Pizarro was murdered.

The Bishop of Peterborough, in a letter to the Church of England Temperance Society, expresses an opinion that there is decidedly less intemperance now amongst all classes than there was fifty years ago.

In the Bermudas numbers of houses are built of rock coral, which have the advantage of being extremely durable as well as permeable by air currents, thus rendering the houses cool and light. "In this country," says the Lowell Courier, "the same object is attained by having the house built by contract, with cobble-stone underpinning."

It is a curious fact that Burns, who was to become one of the most exquisite of song-writers, was totally devoid of any musical gift. In learning church music along with other rustic lads, he and his brother lagged far behind the rest. Robert's voice especially was untunable, and his ear so dull that it was with difficulty he could distinguish one tune from another. This want of musical faculty was also conspicuous in Keble, Heber, and Frederick Robertson, the two first of whom were poets, and the last of whom possessed in an extraordinary degree the power of appreciating poetry.

CANADA is anxious to have a "weather bureau." Stay your hand. Weather bureaus are very unhandy pieces of furniture. They are always out of order. Summer weather is getting into the winter drawer, and spring weather is tumbled about over the edge of its drawer and getting mixed with autumn weather, and every time you pull a knob for snow you strike the rain-valve, a hurricane hits you in the face, or a simoon crawls out and settles in your vest pocket. Better let weather bureaus alone and get along with an almanac and a blue cotton umbrella.—*Exchange.*

For Women.

CONDUCTED BY MISS RAY CLARK.

THE DIGNITY OF HUMAN LIFE.

MARY E. WARD.

BEATING, beating, throbbing, quivering,
Oh, the mystery of life!
Meaning love and meaning hatred,
Meaning peace and meaning strife,

Who has never waked and listened,
In the silent, solemn night,
To the strong and steady heart-beat
With a calm, intense delight?

Ever beating, never pausing
Though the wheels of trade stand still,
Noting neither time nor seasons
Nor obeying human will.

Sometimes 'mid the din and bustle
Of a crowded city street,
Human life seems but an atom
'Neath some monster's rushing feet.

Think we, deafened by the roar
"What is one poor human soul?
Were it lost, a thousand more
Might be brought to make it whole."

Through the day such thoughts may vex us,
But as night creeps slowly on,
Find we that with human footsteps,
So our monster, too, is gone.

All the crash and all the tumult,
Which are accidents of trade,
Ceases when man's weary forehead
Is upon its pillow laid.

Learn we then that life is holy.
That each soul must wear its crown,
That though walking ways most lowly
It were sin to lay it down.

Life in life, and life in death,
Life in Heaven and life on earth,
Differ only by a breath,
And the nature of a birth.

WORLDLY MATTERS FOR GIRLS.

Hair.

WE will suppose by this time that all the young lady readers of the RURAL have the most charming complexions, that it would be impossible with a powerful microscope to find the slightest blemish, and I am sure in a month after reading this article you will have such a quantity of hair that it will take three times the number of hair-pins to keep it in place that it formerly did.

But, without joking, I do know of a few things that, if they do not increase your hair to three times its present amount, will certainly improve it in looks, and in time will increase its growth.

First, washing it, not oftener than once a month, in rain-water, with a tablespoonful of borax added, or, if that is not handy, white Castile soap.

Second, if possible, wear it in a neat braid down the back in the morning. Nothing is so injurious to the hair as wearing it in an unnatural position a great length of time.

Third, cut off the split ends of the hair about once a month. This will increase its growth, as you know the hair grows from the ends.

If your hair is coming out badly, and a speedy remedy is needed, use "London Hair Restorer." It is the only article that I know of that will prevent hair from falling, although there may be thousands of others, but I am certain it will do no harm, and in my case, and those of a number of friends, it worked like a charm. (This is no advertisement.)

The hair was never arranged so simply as it is now. One can dress the hair becomingly, and still be fashionable.

A young lady who was noted among her lady associates for the graceful manner in which her hair was always arranged was asked her secret. Her reply was, "studied carelessness." If you "do" your hair in a French twist, which, by the way, is always pretty, don't twist it so tight as to make it look as if one more twist would leave you hairless. Roll it from left to right, and quite high from the nape of the neck. What short hair remains, if not naturally curly, curl it. It takes very little hair to arrange it in this style.

For round and oval faces, "butter-cup braids" are almost always becoming.

The most graceful way to wear the hair in front is to part it in the middle and wave it. It gives a gentle expression to the face.

In spite of all that has been said against bangs, to some faces they are vastly becoming, and are almost necessary to those having large foreheads.

"Montagues," or spit curls are very pretty if after drying they are combed out, so as to take off the stiff look. MISS M. D.

Michigan.

FASHIONABLE MARRIAGES IN PARIS.

THE prevailing methods of arranging fashionable marriages in Paris, shows that the opportunities for social intercourse between the affianced parties are comparatively numerous. The most essential difference between the French and American system appears to be, that before the young gentleman pays his addresses in any form whatever to the young lady, it must be distinctly understood that matrimonial engagements are seriously contemplated on both sides, and that they will be mutually agreeable to both families interested. After the stage is reached in which the fact is recognized that a marriage will be desirable, a place is fixed at which the prospective husband and wife may have their first meeting, which may be either a friend's house, a concert, a ball, the opera, or one of the theatres. If the opera is selected the young man sits in the orchester and the young girl in front of a box, and between the acts the young man pays a visit and is presented. If he is disposed to ratify the tacit understanding made by his parents, he visits the house of his future wife on the following day and formally demands the young lady's hand. If he is accepted by the parents he begins to pay his court to the young lady, and he is admitted to the house as if he were a member of the family of his prospective bride. It is understood that the day after his acceptation by the family he is to present a ring of a specific pattern. He is also expected to send every day a boquet of flowers to his affianced. Liberal expenditures are made for these presents, as it is the custom to envelop the bouquet with lace or watered ribbon, on which the name of the girl is embroidered. The wedding trousseau of the present period in high life comprises twelve dresses, all made up, with stockings, shoes, sunshades, and hats to match; and the trousseau, together with the linen, is usually worth from four thousand to ten thousand dollars. On all wedding presents the young lady's crest, motto, and monogram figure. On the day of her marriage the only jewels she wears are those given to her by her mother and her husband.

HINTS.

FOR hanging pictures use copper or silver wire. Moths eat out the inside of the cord. Water in which onions have been boiled, rubbed lightly over the frames, will keep insects away from them.

Nephinite is a recently patented colorless substance held in solution for the purpose of treating silk, woolen and cotton fabrics, paper, feathers and other materials, rendering them water repellant and proof against dampness, mildew and moths.

TO WASH SHETLAND SHAWLS.—Make up a thin lather of boiled soap and water; plunge the shawl in this, and gently strip it through the hand. It must never be rubbed or wrung. When clean, rinse through water without any soap, hang it up for about a minute, shake it gently by each side alternately, pin it out on a sheet exactly square, and if the shawl be of a fine texture it should be slightly sewed down the sheet by the top of the fringe to prevent its running up; then go over the whole fringe, drawing each thread separate and laying it straight out. If these directions are carefully attended to the shawls may be washed many times, and each time appear as well as when new. They should never be put into the hands of any but those who are accustomed to wash lace.

News of the Week.

MISCELLANEOUS NEWS.

Monday, July 6th, 1880.

ALMOST before the terrible scenes of the loss of the Narragansett have lost their vividness, we are again called upon to chronicle another steamship disaster. A large steamboat, Seawanhaka, which ran between New York and ports on Long Island, took fire and burned on the afternoon of the 28th ult. The fire originated from an explosion, but nobody seems to know what caused the explosion. A dumb thud was heard, and a shock was felt from stem to stern which was immediately followed by a violent outburst of flames through the smokestack. The boat was instantly headed for the shore, but though she struck ten minutes from the time the explosion occurred the fire spread with such rapidity that about 40 lives were lost, some in the flames, others in the water. There were about 300 persons on board at the time of the disaster. The boat ran ashore in four feet of water, and many tugs, sailing vessels and row boats were close by; under these circumstances it seems strange that so many persons should perish.... A number of counterfeit one-hundred-dollar bills have recently been found to be in circulation. They are said to be so clever imitations of the genuine bills that noted experts have declined to express an opinion as to their being genuine. Not only is the printing well imitated, but the quality and make of the paper is almost identical with that used by the banks on which the bills are forged. The U. S. Secret Service officers are hard at work, and will, no doubt, sooner or later, intercept the criminals. ....Gen. J. B. Weaver, of Iowa, has been nominated by the Greenback party as their candidate for the Presidency....An international rifle match was recently held at Dollymount, Ireland, in which the American team again carried off the honors by making the highest score....Carl Petersen, the celebrated Danish explorer of the Arctic regions, is dead. ....An order of Prince Bismarck is published prohibiting the importation of sausages and pork from the United States. The prohibition does not include hams, sides, and bacon.... Destructive forest fires are again sweeping large tracts of woodland in Monmouth and Ocean Counties, N. J. In the lower section of the counties, miles of cedar forest which escaped the last two fires are ablaze. Around Mechanicsville and Poplar fires of some magnitude are reported to be destroying the cedar and pine forests and causing much alarm among the inhabitants. On Sunday week nearly 300 acres of valuable timber were destroyed near Sellerville, Ocean County.

LATEST NEWS.

Rain all over Long Island and New Jersey ....400 houses damaged and 30 people hurt by a gas explosion in London....A quiet Fourth of July.

PERSONAL ITEMS.

General Hancock is a twin. His twin brother, Hilary Hancock, is a lawyer at Minneapolis, Minnesota.

Henry Ward Beecher's hobby is rugs. The floors of his house are adorned with rugs of every nation, hue and texture.

Aristarchi Bey and Rustem Effendi sailed for Europe last week, the Turkish mission to this country having been abolished.

Secretary Sherman reads until late at night but is always the first man in his office in the morning. He owns a large number of inexpensive horses and drives a great deal. He has always saved his letters and has one of the largest collections in the world. He and his brother, the General, have always been as loving as sweethearts and his letters from the General are in three large volumes. Some of these letters cover forty pages each.

Miscellaneous.

XX COT (not painted, White Duck) $2.

Makes a perfect bed. No mattress or pillows required. Better than a hammock, as it fits the body as pleasantly, and lies *straight*. Folded or opened instantly. Self-fastening. CORNELL'S A B C
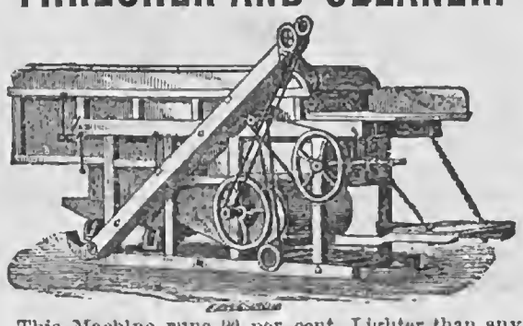
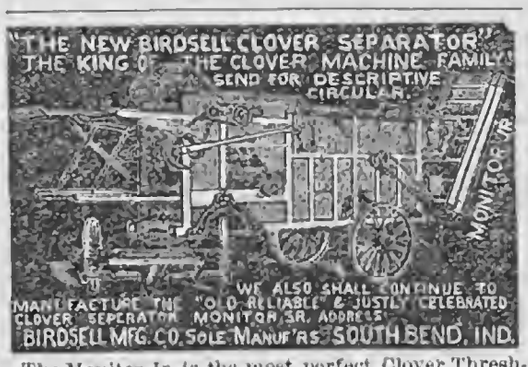
THRESHER AND CLEANER.



This Machine runs 20 per cent. Lighter than any other Thresher and Cleaner in the market, and does MORE and BETTER work with the same amount of power. The sizes are from a 22-inch cylinder for a One-Horse Railway Power to a 36-inch cylinder for a Six-Horse Lever Power. Write your name, Post-Office, County and State, plain, and address

ALBANY AGRICULTURAL WORKS,
O. H. P. CORNELL, Proprietor. ALBANY, N. Y.



The Monitor Jr. is the most perfect Clover Thresher, Separator, Huller and Cleaner in the world. The Threshing and Hulling Cylinders run under-shot. They also continue to manufacture the old "Monitor," with *Threshing* and *Hulling* Cylinders running *over-shot*. Send for price list, terms, and descriptive catalogue. Address as above, and say you saw this in the RURAL NEW-YORKER.

MINNESOTA CHIEF!

The Best Thresher on Wheels!

It is not a vibrator, neither is it an apron machine, but the best points of both are combined, with new and original features of its own. It is wonderfully simple in its arrangement. It is admirably perfect in its threshing and separating qualities. It saves all the grain, and cleans it ready for market. It runs easily, is constructed durably, is finished beautifully, is the most economical, least expensive, and altogether the most satisfactory machine in the market.

It will handle wet grain as well as dry. In threshing Flax and Timothy it has no equal, threshing and cleaning both as well, and nearly as rapidly, as wheat, and requires no change except the sieves. It has more square feet of separating and cleaning surface than any other machine made, and cannot be overloaded. It is both over and under blast at the same time.

Our clover hulling attachment is a new and very desirable feature. It does the business more rapidly and better than an exclusively clover hulling machine.

Separators of the various sizes fitted for Steam or Horse-Power, as desired.

An Improved Pitts Power, an Improved Woodbury Power, and the Elward Equalizing Power, all mounted on four wheels, are manufactured by us, and are not surpassed by any in the market.

Humorous.

IF matches are made in heaven, where do they get the brimstone?

"How does painting agree with my da ughter?" asked an anxious parent. "It makes her too red in the face," replied the teacher.

A LITTLE boy was taking a walk with his mother, when suddenly a thunderstorm came on, when the little boy exclaimed, "Oh, mamma, the sun is bursting into a loud laugh."

"HAVE you been stealing apples?" asked the minister. "Yes, sir," answered the boy, sheepishly. "And are you trying to hide them from me?" continued the good man. "Yes, sir," said the culprit, and then added, his face brightening up, "you said last Sunday that we must avoid the appearance of evil."

Timely Repairs.

It is the *ne plus ultra* of carelessness to delay repairs when the human edifice manifestly requires them. Failing strength, a dyspeptic or constipated habit, weak nerves, biliousness, sick headache, are maladies indicative of an increasing want of stamina, productive of a feeble discharge and irregularity of the vital functions, which must eventually increase alarmingly if not checked in the beginning. The speedy change in the condition of a debilitated physique and shaky constitution by Hostetter's Stomach Bitters, a searching alterative and efficient tonic, as remarkable for its purity, as for the thoroughness of its action. Increase of appetite, the disappearance of nervous and dyspeptic symptoms, and a return of cheerfulness and vigor mark its operations, and are speedily hailed and gratefully acknowledged by invalids who, by the timely use of this reparative agent, save their constitutions from the ultimate wreck which is the reward of neglect.

Barbour's Irish Flax Thread,

Chambers's Encyclopædia.

15 Vols. Over 13,000 Pages. Price During July, $6.25.

Among the wonderful things which have been accomplished for lovers of good books by the "Literary Revolution," perhaps the most wonderful is the reproduction of this great Encyclopædia at a merely nominal cost.

It is a verbatim reprint of the last English edition, in 15 beautiful volumes, clear nonpareil type, handsomely bound in cloth, for **$7.50**; the same printed on finer, heavier paper, wide margins, and bound in half Russia, gilt top, price **$15.00.** The first ten volumes are ready for delivery. Vol. 11 will be ready July 10. The remaining volumes will be completed by October next.

$6.25. An Amazing Offer. $6.25.

The more widely and rapidly these volumes are scattered, the greater is their influence in inducing other purchasers of this and our many standard publications. Accordingly we give special terms to early subscribers.

To all whose orders and money are received during the month of July, we will supply the 15 volumes, in cloth, for **$6.25**, and in half Russia, gilt top, for **$12.50.** To any one sending from any place, where we have no special agent (usually the leading bookseller of the town), a club of five orders, we will allow a commission of 10 per cent. The volumes issued will be sent at once by express, and the remaining volumes when completed.

A specimen volume in cloth will be sent, post-paid, for **50** cents, or in half Russia, gilt top, for **$1.00**, and may be returned at once, if not satisfactory.

The "CHAMBERS'S ENCYCLOPÆDIA" comprises the first 15 volumes of our "Library of Universal Knowledge," and the remaining volumes, complete in themselves, will be sold separately when published.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXIX. No. 29. WHOLE No. 1590. | NEW YORK, JULY 17, 1880. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Floricultural.

THE GREEN ROSE.

IT is an extravagant saying that one may have green roses and black roses and blue roses in a great collection of kinds, but, of course, such a collection does not actually exist. We once knew a lady who bought what purported to be a collection of one hundred distinct kinds of roses. They proved to be, however, one single kind and that Paul Neron, and yet it was positively averred by the salesman that among them were green roses, blue roses and black roses. The fact is, all roses are simply red with very few exceptions which are pure white. Yet there is a green rose, in sober truth, and our illustration exhibits its form, if not its color, with entire truthfulness. It belongs to the division generally known as China roses. In the climate of the Middle States such roses are not hardy, but they flower so freely throughout the Summer and Autumn that they are termed ever-blooming. The flowers are small, pretty and pink and of little consequence when they are in full bloom. They often survive our winters with moderate protection. The green rose is said to be a mere sport of the Pink Daily China rose. Like all China roses, it is entirely double without sign of pistil or stamen. In the case of the green roses, the transformation is more remarkable because the petals are seemingly little green leaves. Yet these petals are true floral leaves, and only illustrate the fact that, setting aside color, there is a wonderfully close relationship between the leaf and petal of a plant.

The green rose seems to be more or less a favorite in the South, where it is hardy, and where specimens of it are exhibited in gardens as great curiosities. One seldom sees it North. It is looked upon as a mere curiosity, a nine days' wonder, now all but lost sight of. Indeed, it is seldom even named in the catalogues of nurserymen either in Europe or America. In some of them it may be found under the name of Viridiflora under the head of China or Bengal Roses—Rosa Indica. As a general rule all such abortions or monstrosities do not please. But the green rose from its oddity is always interesting to those who see it for the first time, and may well be employed where it is desirable to get together a diverse collection of plants. The flowers of certain strains of petunias have green margins, and it is not uncommon that seedlings from them bear flowers that, like the Green Rose, are entirely green.

REMARKS ON CROTONS.

CROTONS may be conveniently divided, according to the shape of the leaf, into narrow-leaved and broad-leaved. Both kinds are exceedingly graceful, and no foliage plant surpasses in beauty a well-grown, richly-colored croton. They are suited for purposes of decoration both in the conservatory and the parlor, and may even be employed as bedding plants and for out-door vases, with proper care. For these reasons they are rapidly and justly growing in favor, and they would soon be found in every collection of plants were it not for the drawback that for perfect development they need a degree of heat and humidity in the atmosphere which cannot be supplied in this climate short of a greenhouse.

As types of narrow-leaved and broad-leaved crotons we present the accompanying illustrations. Prince of Wales, figure 229, is a graceful, richly-colored species of free-branching habit. The leaves are narrow, pendulous, arching, and take a slight twist as they bend downward, and some of them present a complete spiral form, the edges being always beautifully undulating. The color of the leaf, in well-colored plants, is almost entirely pale yellow, margined and mottled with bright carmine, with occasional irregular blotches of light green; the midrib and petiole are bright magenta. Figure 230 is a good representation of Croton Stewartii. It is one of the finest broad-leaved crotons in existence. It is of dwarf habit, and, withal, bushy and vigorous. The leaves are obovate, with short stalks and of a dark olive green, irregularly banded and margined with a rich orange color. The midrib and petioles are a bright magenta which produces a striking contrast with the carmine marking on the remaining portions of the leaf. Both of these plants were introduced by the well-known plant grower, Mr. B. S. Williams, of London, England.

CROTONS.

THERE is no class of foliage plants which display more diversity of form and color in the leaves than the above, and no class to which there have been so many novelties added of late years, if we except the coleus; and although many species or natural hybrids have been introduced from the Tropics, there have been also many hybrids raised in Europe and also in this country; many of which are quite distinct, and if we had not already so many handsome varieties they would be considered very fine. I may mention that a friend of mine has over ninety named kinds, and when well grown into good-sized plants these are all quite distinct; but I may mention that when the plants are small, but few sorts show their full colors, unless the cuttings are selected from well-colored plants. A few hints on the cultivation of these plants may be of service.

In the first place, select nice, clean free-growing plants; if nicely colored it is best, although not essential, for if well treated the plants will soon color. It is necessary to give abundance of heat and moisture with but little shade; the plants will not succeed in a dry, drafty house in hot weather, for which reason it is necessary to shade slightly during summer, and give the foliage a good dash with the hose once or twice each day. I have grown good plants both in peat and also in loam, but I prefer giving moderate shifts as required to shifting from a small pot to a large one at once, and quite a large plant can be grown in a small pot if well attended with water. With free growth insects are not troublesome; but if the plants receive a check from sudden change of temperature they often drop many of the best leaves. Although the plants will live outside during the Summer, they make little growth, and they do not color well, for our Summer is too dry.

The old Angustifolium, when well colored, is like a fountain of gold, and is yet one of the most graceful species, although Johannis, when well grown, is wonderfully fine, and Veitchii, one of the first of the newer sorts, and these caused quite a sensation, are yet among the standard species; and when the kinds with lobed leaves, of which Disraeli is a good type, were distributed it was considered a wonderful advance; but now we have various other shaped and colored leaves named after many of the nobility and statesmen of Europe, queens and princes included. JAS. TAPLIN.

THE GREEN ROSE.—From life.—Fig. 228.

Horticultural.

RURALISMS.

BY HORTICOLA.

IT is often said in behalf of birds by their special friends, that in eating fruit they do so for the sake of the worm. They doubtless get a worm with nearly every cherry they eat; but how is it about the worm when they "go" for the strawberry? Perhaps they think strawberries are good enough without worms. If so, I agree with them. Still, I should be willing to furnish them with all the worms they want if they would spare me a small share of the strawberries, which the charming little wretches have failed to do this season.

This reminds me to inquire for the coming man who is to furnish us with a good contrivance for protecting strawberries from the birds. It should be something light, durable, easily applied, admitting sunlight and air freely, and not too costly to be used by the acre. Wire might answer for the garden, but is too cumbersome for the field. Something like the seine used by the shad fishermen would do, made of fine twine, with small meshes, and boiled in oil when finished. Here is a chance for somebody to make strawberries cheap and plentiful. I have used cheese cloth and mosquito netting, but such thick coverings hurt the flavor of the fruit.

It is not to be doubted that we coddle a good many things under the supposition that they are tender, which prove not to be so. I have said that the Japanese climbing fern passed successfully through the past winter without protection. I have since made another discovery. Last Fall a year ago I lifted some Lilium longiflorum for forcing in Winter. Some bulbs of Oxalis Bowiei fell into one of the pots, and I let them remain, having an abundance of them. The following Spring the lilies, with the ball of earth adhering, were turned into the border to recuperate. I noticed last Summer that the Oxalis was growing. It remained in the border last Winter without protection, and a few days since I noticed that it was growing luxuriantly. I hope it may continue to prove hardy, since it will make a fine border plant.

At Mrs. Palmer's, near Mamaroneck, N. Y., a few days ago, I had the pleasure of going through what is called an old-fashioned garden, where one can go on almost any day in Summer, and cut a "bunch of flowers." Here were the old double red and white herbaceous pæonies, Pæonia tenuifolia (single), tree pæonies, larkspurs, Canterbury bells, foxgloves, June and hybrid roses, and many other good old things, now seldom seen except at some old country home, and all growing and blooming luxuriantly. Are we not making a mistake in neglecting these fine old plants? At some future time we may wish for them in vain.

So far as I can judge at present, the Snyder blackberry promises to become a popular market fruit with growers along the Hudson. I saw it lately at Mr. Roe's, and was surprised at its prolificness. I saw it again at Mr. Force's, and was still more surprised, the plants being older. They were a solid mass of fruit. It has been proved to be hardy everywhere, needing no protection whatever. The fruit is not so large as the Kittatinny, but is earlier, and is ripe and sweet, Mr. Force says, as soon as colored. Of the quality I cannot yet speak personally, but it is represented to be good.

I also saw at Mr. Force's (June 12th) an early raspberry named Burn's Early, the fruit of which was then pretty well colored, while all other kinds were still quite green. Mr. F. has just informed me that he picked ripe fruit on June 11. If the quality should be good enough it would enable the Northern grower to share the market with the early fruit from the South (say from Baltimore), and realize a portion of the early profits; provided, of course, it proved to be a kind not adapted to the South. It is worth looking after.

I am decidedly of opinion that much valuable information might be collected by close observations of the effects of the drought on growing crops, as well as on trees and shrubs, including all the inmates of the garden. An excellent example is that given from the Rural Grounds in regard to the Hemlock, supplemented, perhaps, by a brief statement of the nature of the soil and the exposure. At the close of the season the editor could tabulate these observations and present in a condensed form a good deal of valuable information. The same might be done in regard to hurtful insects.

A recent correspondent of the RURAL has entered a plea for the mole, and perhaps as good a one as can be made; but I think he has failed to comprehend the mole, unless he has him under a subdued character. The mole is an unmitigated nuisance where he abounds in numbers, destroying peas, corn, potatoes, strawberries, the lawn and everything that comes in his way. Of all the pests that trouble the field, the garden and the lawn, there are few that are made up of so much pure "cussedness" as the mole. To employ him to destroy larvæ and worms is to use a remedy worse than the disease. It will take a year or two at least to repair the damage he has already done in my experimental garden. There is this, however, to be said in his favor, that he is a fine example of perseverance.

One lesson of the drought, so to say, is so universal, that it would seem to be almost entirely overlooked, and that is the want of water, strange as it may seem to say so. I hear a great deal about the drought, but very little about the want of water. All, in some form or other, pray earnestly for rain; but very few say anything about the want of water on their farms. Nearly all are looking for water from above without labor, and very few consider how they might get it abundantly from below. If it be true (as it doubtless is) that the Lord helps those who help themselves, it seems plain that we should first go to work and bore wells, build cisterns, and other storage for water, put gutters to our dwellings, barns, &c. (which are by no means common in the country), and then, in a time of need, we might, with some sort of fitness, ask for help from above. The fall of water is nearly always sufficient for our needs if it were properly stored.

I have been much interested in the Japan pears. I recently saw Mr. Force's collection at Newburgh, N. Y., which is perhaps the best in the vicinity of New York. The fruit is not of good quality, but still all that are sent to market sell quickly. They are somewhat astringent, and would no doubt make a good jelly. The tree presents a fine ornamental appearance, and would not be out of place on the lawn. The large, thick, glossy leaves remind one of the Camellia. They may prove to have a value also for grafting other kinds on, and for crossing. They are now grown mostly at the South, but do quite as well here; in fact, the first trees were grown at the North.

In England the electric light is just now being much talked about as an aid to horticulture. From experiments recently made by a scientist it is inferred by some that, with the aid of the electric light, plants may be kept growing during the night quite as well as by sunlight during the day. They will probably be disappointed unless they succeed in changing the nature of plant life. Plants come to a puny end when submitted to forcing of this kind, if long continued. It was demonstrated in New York more than thirty years ago that the growth of plants was increased by the direct application of a current of electricity, and plants are probably constantly more or less influenced by this mysterious agent much in the same way as mankind are. It is no new thing that plants are excited to renewed and continued action at night under the influence of a strong light; and I apprehend that the marked action produced by the electric light is due, not to the fact that it is an electric light, but to the fact that it is a light of great intensity. Any other light as intense would doubtless produce the same results. Under the influence of a strong light I have often kept open during the night flowers that would otherwise have closed in the shades of evening and remained so. It is worth while, however, to continue the experiments, as there may be some peculiar virtue in the electric light not yet apparent; only, thus far, no results have been obtained that have not been yielded by other light in an intense form.

NOTES FROM THE RURAL GROUNDS.

Of the two extremes, drought and too much rain, we prefer the former for these grounds. Though the lawn and flower-plots present a sorrowful sight, shrubs and trees are rarely injured — while grapes, raspberries, blackberries, currants, gooseberries, and all kinds of vegetables are sufficiently protected by careful cultivation.

Raspberries the present season, which is one of exceeding dryness, bear an abundant and luscious crop. Turner is always here, as, indeed, in many parts of the country, one of our best varieties. Hardy, fruitful—the berries are of large size, of a bright-red color and of excellent quality. We have had this berry for years—have written of its superior qualities persistently, and are now glad to find that it is in a fair way to excite the general interest it so highly deserves. Of red raspberries, our friends, as a general thing, can do no better than to plant Turner for early and Cuthbert for late.

Gregg.—The new canes of the Gregg, are wonderfully strong and stocky—the berries which are clustered together are large and delicious. This is our second year with this new Black-cap and we can freely add our testimony to that of many in the West where it originated (Indiana) that it promises to be all that is there claimed for it. We may now acknowledge that our engraving of the Gregg, given in the Rural of March 13, was, indeed, unfair as regards the average size. The branch from which it was drawn was sent to us by a friend and accurately reproduced. It is a truth, moreover, that illustrations, though of the exact size of the originals, appear distinctly smaller in print—a fact for which a too liberal allowance is made by small fruit growers, as shown by the colossal cuts of their catalogues.

We do not wish to intimate that Belle de Fontenay and Henrietta are not identical. We cannot distinguish the one from the other. It is worthy of note, however, that a Henrietta is now ripening fruit upon a large healthy plant, while a Belle de Fontenay, growing within 12 feet of it, was so injured by the past Winter that it will bear no fruit. This, as evidence against their identity, is very slight indeed. The failure of B. de F. may be due to a dozen different causes that do not affect Henrietta.

This raspberry, whether Henrietta or Belle de Fontenay, should find a place in every garden for family use if not for market. The berry is very large and as fragrant of the odor and as rich in the characteristic raspberry flavor as any kind that we know of. It may also be mentioned that it bears a Fall crop of berries which, of course, are borne on the canes of the same season's growth.

The Caroline was sent to us last year by Mr. Carpenter of Rye, N. Y. This is a yellow raspberry and thought to be a cross between Brinckle's Orange and Catawissa. It has, thus far, proved hardy here. It is very prolific, firm, of medium size and first-rate quality. The New Rochelle (also originating with Mr. Carpenter, we believe) is said to be exceptionally hardy. It is also said to be very productive. The berries are purple, acid in flavor and not very firm. Acidity, however, is no detriment to a raspberry. Better that, which may be remedied by the use of a little more sugar, than the insipidity of a Thwack, Brandywine, Highland Hardy, or Philadelphia.

Improved Hollyhocks.—The showiest, almost the prettiest sight we have ever looked upon in these grounds is a double row of Chater's hollyhocks extending nearly across the garden. We do not wonder that the old-fashioned hollyhock fell into disuse years ago. But the comparatively dwarf improved kinds are wreathed with large double flowers that cover from two to three feet of the stems. Every flower is a perfect rosette of petals that are frilled, crimped and crowded together as closely as possible. The colors are pure white, lemon, pearl, lilac, salmon and all shades of pink and red until a vivid crimson is reached. Imagine then the brilliancy of this display and be not surprised if, when seen and known, the despised hollyhock, in its new belongings, will again find a welcome place in every garden.

The growth of Salix pentandra (cuttings of which the Rural has lately distributed among those subscribers who applied) is sometimes discouragingly slow for several years. One tires of waiting, especially as the young plant shows very little of the beauty which characterizes it in later years. We have one specimen at the "Rural Farm" that is now in its third Summer that has not grown two feet. The leaves are small and many of them have turned yellow and fallen from the effects of the drought. Yet, in a hotter and more sandy situation here, older trees thrive to perfection. As we make this note we involuntarily ask Randall (the Rural gardener) pointing to a specimen before us: "Did you ever see a finer tree?" And he replies: "No, I do not think I ever did." Though but five years old from the cutting, it is a thicket of large, glossy leaves that, swaying in the breeze, reflect the sunlight as so many mirrors.

STRAWBERRY NOTES FROM CHEMUNG COUNTY, N. Y.

The strawberry season in this locality is now over, and the crop has been proven to be an abundant one. I offer my opinion on a few varieties which I have tested this season.

The Col. Cheney, which I place at the head of the list as a berry for a near market, continues to give great satisfaction both to producer and retailer. It is a large, showy berry that we can place upon the market at a price which will warrant a ready sale. This is owing to its great productiveness, which has not been surpassed by any variety on our grounds.

The Monarch of the West is a large, showy berry and of excellent flavor, but is not sufficiently productive to make it a first-class market variety. It has valuable qualities, however, the berries holding out in size to the end, and it is firm enough to stand up well, the lack of such firmness being the great fault of the Col. Cheney.

The Cumberland Triumph is a good market berry, being large and moderately productive, yielding with me somewhat better than the Monarch, and, as the berries color up more evenly, I consider it the more desirable of the two for market. In our market (Elmira) flavor has little to do with the sale of strawberries. If the fruit is large, fine in appearance and cheap, that is all that is required to make it sell readily.

The Forest Rose is a good variety, though, like the Wilson, the berries dwindle in size after the first few pickings.

The Star of the West has not proven desirable on first trial, being only moderately productive and the fruit small in size.

I have tested other varieties, but, as they have not proved of value, I will not mention them. The Crescent, as seen on a neighbor's grounds, I pronounce *wonderfully productive* though deficient in size and flavor.

Elmira, N. Y. G. A. G. JR.

Field Crops.

WHEAT NOTES FROM VIRGINIA.

The wheat harvest in this county began on June 10—some two weeks earlier than usual—and ended on the 15th. Looking back to the usual time of seeding in the Fall, and extending our observations up to harvest, it will be noticed that this season has presented some remarkable peculiarities. The Fall was so dry that the grain lay in the ground for weeks before it germinated; much of it sprouted and perished for want of moisture, and at the beginning of Winter the stand was very thin. If the Winter which followed had been an ordinary one, few plants would have remained on the ground by Spring. Fortunately, the Winter was exceedingly mild, the plants tillered finely, and covered the ground. Then from the middle of April till the first week in June, we had a drought which was most severely felt in many parts of the country, burning up the grass and the fields of wheat on the uplands. From the first of June the rains have been abundant. The result has been that while the wheat crop has not equalled the expectations which were entertained of it, yet so far as I have been able to ascertain, it is considerably above an average. Many promising fields have been seriously damaged by the black rust for weeks before harvest, the leaves of nearly all the wheat were yellow with the red rust (Uredo rubigo), and the farmers were praying, in the language of Ovid.

"O blighting rubigo spare the corn plants,
Suffer the crops which have been nourished by the propitious
Stars of heaven, to grow until they become fit for the sickle"

This red rust should not be confounded with the black (Puccinia graminis). Of itself, it does no serious injury, but it may be, and often is, the precursor of that other and more destructive kind. Much injury has also been done in many places by the maggots of the European wheat fly, which I have observed here for the first time this season. The pollen of the grain is frequently eaten up by them, so that the grain never forms at all, or the kernels shrink from the loss of milk abstracted by these maggots. I have found as many as four or five of them within a single glume. Late-blooming varieties of wheat, and such as have square-shaped ears, like Arnold's Gold Medal, are particularly subject to be attacked by them. I have one field of the Gold Medal containing eight acres, which, principally for this reason, will not yield over 25 bushels. On the other hand, I have a field of Fultz of 20 acres which will give an average of 15 bushels per acre. It would now seem that hereafter we shall lie between two fires. If we sow our wheat very early in the fall, it will have to encounter the depredations of the Hessian fly; if late, it must suffer from the fly above noticed. It is worthy of note that the bearded Mediterranean varieties are freer than others from diseases of all kinds, seldom or never taking the rust. They have, in every instance, made the best crops here this year. Besides, the millers say that these red wheats make the best flour.

Another fact which has come under my observation is, that seed wheat which comes from south of the grower will do better than that coming from north of him. Of 15 varieties of wheat distributed by the Department of Agriculture in the last ten years and brought mostly from Michigan, Canada, and Northern Europe, not one, if we leave out the Fultz, which originated in Pennsylvania, has proved a real acquisition here. The wheat grower of New York, for instance, when he wishes to change his seed should procure it from Virginia and the Virginian should bring his from still farther south. Varieties from Northern localities are always later than the old established sorts.

My Experimental Plot.

I notice that in the Rural Special Reports, this is put down as 27 acres, of which one-half an acre was Fultzo-Clawson. I intended to write that the plot contained two acres and a half, of which one and one-fourth acre was Fultzo-Clawson. I find, however on actual measurement that the area is as follows:—Fultzo-Clawson, one acre; German Amber, half an acre; Boughton, half an acre; total two acres. I shall make a report of the manner of planting, yield etc. when the wheat is thrashed.

Dwarf Wheat.

I have for several years entertained the opinion that American varieties of wheat grow entirely too tall to bear cultivation on a highly enriched soil. I am more than confirmed in this opinion by one result of my experiments this year, of which mention will be made in my report. It will, perhaps, be remembered that, though all the grains came up and grew off finely, they became a prey for the rabbits, that kept them bit into the very earth, no other wheat being planted at that time to help divide their attention. I then drove stakes around the plot to keep the rabbits out, but they would squeeze through the cracks. These stakes afterwards became indirectly a worse enemy to the plants than the rabbits which they were intended to keep out, for in the Spring the house sparrows and other birds made perches of them and nearly devoured the whole plot. All but five of the plants were destroyed before Winter. The five survivors, on account of having to repair the damage sustained from the rabbits, bloomed rather late, and for this reason, and because of the wheat fly, the ears either did not fill at all or have only a few shrunken grains. The point about the whole matter, however, is that there were three varieties of wheat among the five plants (there would probably have been eight or ten if the whole twenty had remained), and one of these plants produced 15 ears, not one of which exceeded two feet in hight, although the plot had been heavily manured with chicken manure. The stalks from the other plants grew about four feet high. The stalks of Boughton growing near by and manured in the same way, grew to a hight of five and a half feet.

I have entered into the above particulars, not in the way of a complaint against ill-fortune, but to show the difficulties which are to be encountered when one attempts to get an available quantity of wheat with a start of only a few grains.

The Eldorado wheat, illustrated in the Rural of June 19, is nothing more, I think, than the old Egyptian, which, Johnston says, was known in Germany 240 years ago. When grown in unfavorable soils and climates the branches of the spike are not evolved and it then assumes the appearance of ordinary wheat. The grains are said not to yield so large a proportion of flour as those of any of the other species, and the flour is not very superior to that of the best barley. I believe this wheat has once or twice been distributed by the Department of Agriculture, which is perhaps the way it reached Colorado.

Pulaski Co., Va. Hugh L. Wysor.

VARIETIES OF WHEAT.

PROFESSOR A. E. BLOUNT.

It may be interesting to the farmers who read the Rural, and especially to those who visit the office, to know a little more about and examine a few samples of their own wheats after they have been raised in this great "American Desert." Of the 66 varieties I am now cultivating on these grounds, I send you 32 kinds of spring wheat all the seed from which they came having been obtained from the Middle States. It is very doubtful if some of the most extensive wheat growers in N. Y. can recognize the varieties from that section. This climate and our soil have such a bleaching, renovating effect upon all small grain as well as on the straw that Eastern people visiting our fields cannot identify the sorts with which they have always been acquainted. Every variety does better, yields more, produces whiter grain and that of finer quality than in the Eastern States. For instance, in one season the old Mediterranean has become a shade or two lighter in color, is more plump and makes better flour.

Among these varieties I have made 10 successful hybrids by crossing the Diehl upon the Golden Straw, the Champlain on the Rio Grande, the Australian Club on the Oregon Club, the Lost Nation on the Touzelle, the Russian on the Improved Fife, the Sonora on the Odessa, and others. Several of these are now two and three years old, growing nicely and promising well.

The wheat question is becoming the most important one, not only to the farmer, but to everybody. To be remunerative it must be raised at less cost and with fewer failures. To raise it at less expense is a problem quite easily solved, if farmers would, for one season, study the demands of the plant and feed it at the proper time and with proper food, save and select genuine seed, and cultivate it in conformity with its mode of growth. The farmer, too, must reduce his acreage or increase his force. One man can "put in" a hundred acres of wheat, but he cannot harvest it alone. Should he put in 10 well (scientifically) and as it should be, in nine cases out of ten he will make more than he would on the 100. The cost of preparing the ground, seed sowing, harvesting and marketing, cannot be covered by 10 bushels per acre or by an average of 15 all over the country at the present prices. [The prices of wheat in the season of '78—'79 were on the whole lower than those in '79—80, and averaged lower than even the present prices,

yet the total crop certainly gave a profit to the producers, although the average yield throughout the country was only 13.7 bushels. —EDS.]

To prevent failures, which come every few years—and in some States every year—is a question not so easily solved. They will come like "accidents to the best of families;" but I think very unnecessarily sometimes. Smut, rust and the ravages of insects can all be in a measure prevented, at least in some seasons. Some varieties resist the attacks of almost every enemy, while others are liable to injury by the most harmless. Hybrids, when well acclimated, are generally much stronger and more thrifty than the parent wheats, and should be adopted by farmers in place of the old kinds that have "run out."

State Agricultural College, Fort Collins, Col.

TIMELY NOTES.

HIGH temperature with seasonable rains has hurried vegetation along till we find haying and harvesting crowding closely upon corn cultivation. Fortunately in this respect the wheat acreage is so small in this locality that little hindrance will be felt from that, but Timothy is already shedding its bloom; clover is past its best and oats have been a week in head. The marketing of the old corn crop and the cultivation of the new are claiming so much attention that much grass must stand till over-ripe before it is cut. Timothy intended to be fed to horses is probably equally good if left to ripen; but when mixed with clover and intended for cattle it should be cut at once. The plan commended by Mr. Stewart of putting up hay before entirely dry and leaving it to cure in large 200-pounds cocks, I think a good one, and if the caps cannot be had or are thought too expensive, the tops of the cocks may be secured against blowing off by binding over with pieces of woolen twine 10 or 12 feet long with pins of wood or heavy wire attached to the ends as recommended for caps. Two of these strings laid over the cock at right angles and secured firmly to the ground, will keep the hay in a condition to shed rain, and where hay is cheap would, perhaps, be more economical than covers of cotton cloth.

Much old corn still remains in first hands and considerable will be held over, as the price has dropped to 29cts. Many refused 35cts last winter and have held their crops till the steady decline in price and the excellent prospects for the new crop dispelled all hope of improvement. Owing to the excessive rains in the midst of the planting season the growing crop presents a very uneven appearance, some fields standing waist-high and some only six to twelve inches. The standing of both early and late corn is good, and the weather all that could be desired.

Thus far oats and flax stand up well, though the rain the past week caused flax to lean for a day or two and reveal to view a considerable crop of weeds before unnoticed. Flax is famous for harboring mustard both in plant and seed, as the seed of both ripen at about the same time, and being of about equal size and difficult to separate, growers of flax should spare no pains to obtain clean seed. While on the subject of weeds, I beg to remind farmers that this is the season to look out for cockleburs. Whenever a patch is noticed, stop the cultivator and pull them up by the roots. This is the plan practiced on farms where no cockleburs are permitted to remain, and is little trouble if commenced in time. As Illinois farmers have no Canada thistles, elders or Quack-grass to contend with, they can afford to keep under this one great pest.

The season for cherries and raspberries is about over, and one noticeable fact of the season is, that the market for small fruits has been better somewhat back from railroads and about small towns than in the larger towns and cities. A considerable population of renters and those who have neglected to plant fruit, and the cheap facilities for preserving, make a good home market for all that is grown in many localities. Those who have had a surplus have been able to dispose of them for $1 per bushel for cherries, and six cents per quart for raspberries, the purchaser doing the picking, and there has been no lack of customers. A neighbor who has a cherry orchard of 300 trees has closed out his crop at from $1.25 to $1.50 per bushel, while at Champaign and Chicago they were down to 75 cents. This orchard, during the past three weeks, has been a scene of activity quite novel and interesting. People from all directions for miles around have resorted thither to buy cherries, young and old of both sexes often bringing their lunch baskets and making it a day of frolic and to the proprietor it has been a handsome little harvest. It would be well for other fruit growers too, and also for the raisers of several other horticultural products, to try and create a home market for their goods; for even if the prices got there are no better than those obtained in the towns and cities, delay, risk of loss, or damage of perishable goods, bad debts, etc., are then avoided. "G."

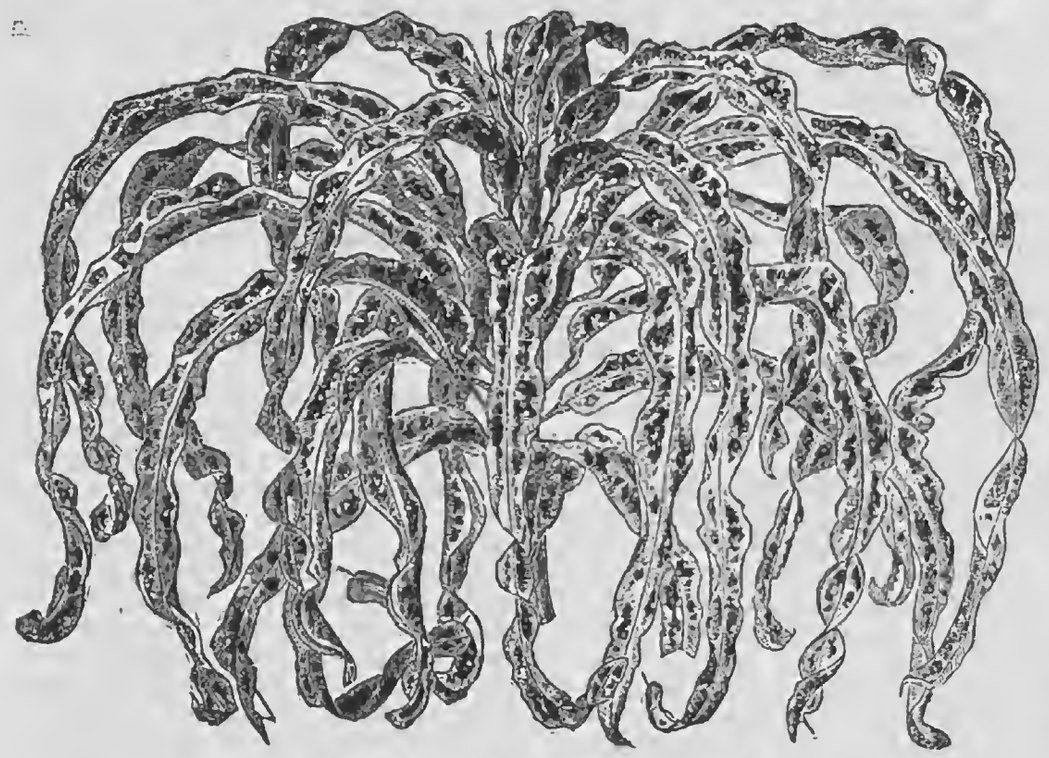
Ludlow, Ill.

Farm Topics.

THE OUTSIDE AND THE INSIDE.

THE editorials and other matter in the RURAL issue of June 26 seem worthy of both commentary and compliment, and, if you will allow it, I will add compliment.

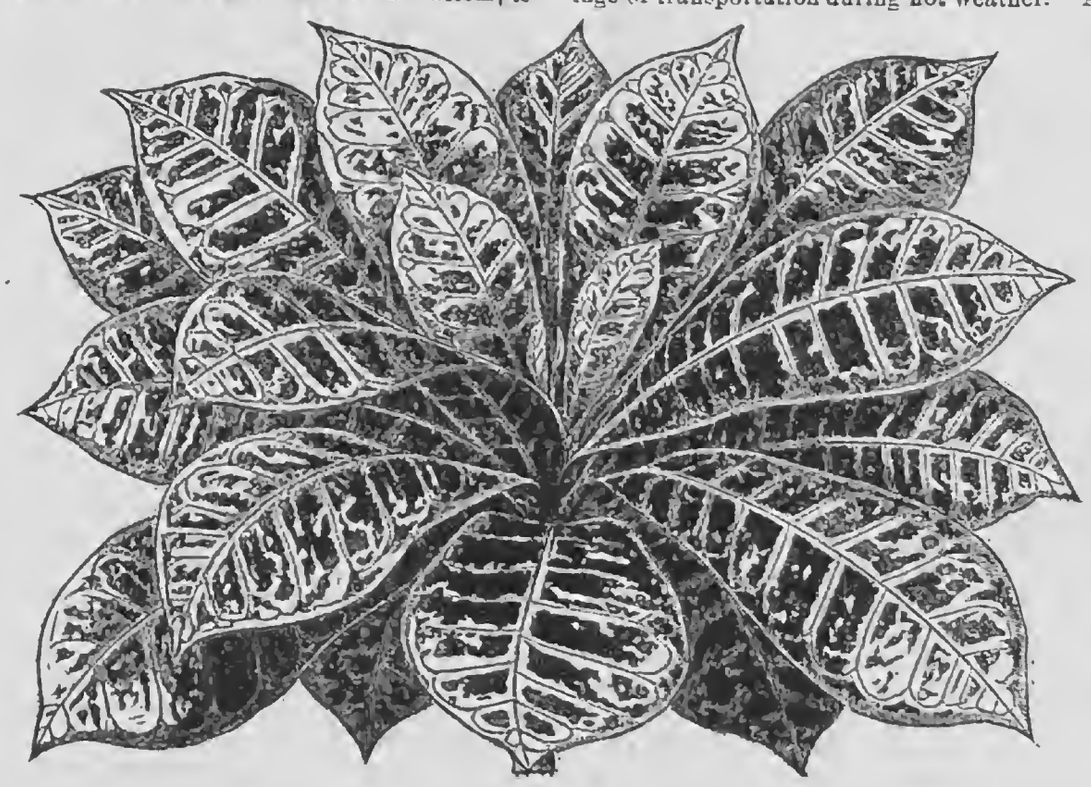
COLORADO BEETLES.—I have had a good deal of experience with this pest, and have been taught by costly experience there is no way of mastering him when he and his progeny appear in force, except by the use of Paris-green, extended some twenty or thirty times in dry



CROTON "PRINCE OF WALES."—FIG. 229.

calcined, or common ground plaster-of-Paris. My practice has been to pay little or no attention to the parent bugs, but to wait till the larvæ appear on the leaves, and then give the vines a thorough dusting with the mixture, using the common instruments for the purpose. Then the second or third day after repeat the process, and that brood is done for. Those who talk about hand-picking, killing the eggs and the like, really know nothing of the scourge when it appears in its worst form. Why, I have seen them appear in such numbers that if twenty persons were set to work to clear an acre, by the time they had gone over the vines, old and young ones enough would be found on them to require the work to be done over again, the same or the succeeding day. But like most insects the Colorado beetle is a lover of heat and drought and revels in the burning rays of an intensely hot mid-summer sun, and I conclude your cool climate of New York and New England will never feel the scourge as we of the West felt it in 1874 and the series of dry years which brought the great droughty year in.

THE ARMY WORM wrought a great destruction to pastures and meadows in Central Illinois two or three years ago, and here and there some 15 years since, did a vast deal of damage to Spring grain. But they appeared so suddenly and in such numbers little or no attempts



CROTON "STEWARTII."—FIG. 230.

were made to destroy them or arrest their course. In the case of pastures and meadows where a heavy roller can be used, if they are discovered in season, the sowing of a barrel, or a barrel and a half of salt to the acre and then giving the surface a thorough going-over with a heavily weighted roller, has been found, if not sufficient to exterminate them, at least enough to reduce their numbers so the crop of herbage would not be wholly lost. Perhaps the greater part of the advantage of such a course of treatment of the Army worm arises from the fact that the salting and the rolling are of value enough to the land and crop to pay the expenses incurred—just as in the case of the dusting of potato vines as above described—the benefit to the soil from the use of plaster is worth more than it costs.

BIG CORN CROPS.—Some years ago, on a very rich soil and under quite favorable circumstances, I made several attempts to grow 100 bushels of dry corn to an acre. But I never came nearer than 90 bushels, and possibly not nearer than 85. But in getting at the outcome I did not content myself, as is usually done, by measuring the product of one, two or three square rods and then multiplying for the whole—but I planted, cultivated and harvested a whole acre, and then when the crop was dry, weighed it. I suppose 100 bushels of corn can be grown on an acre, or even 125; but the season must be very favorable and all the surrounding circumstances fortunate; for five times out of six under average circumstances, the experiments will fail. And in this connection let me ask what is the special good of growing 100 or 125 bushels, over and above the demonstration that that quantity of grain can be grown on that area? Where land is not worth more than $40 to $50 per acre, I think there will be found more profit in growing 50 to 75 bushels of corn to the acre than 100 or 125; because the extra labor, money expenditure and trouble consequent on an attempt to grow these big crops are not made good by the outcome, however large it may be; while crops of 50 or 75 bushels are pretty sure to pay. To my mind the farmer who grows 50 bushels of dry corn to an acre, by the 40 or 80 acres, in average seasons, and 75 in very favorable ones has attained the best point of profitable corn production, and if he attempts to do better than that, he will lose more than he will gain.

THE CRUELTIES OF TRANSPORTATION.—There never was a more opportune word spoken than the RURAL'S appeal for the dumb creatures, our servants and our friends, that are now going through all the horrible sufferings of transportation during hot weather. A ride of some 250 miles during the hot days of the present week, revealed to me the horrible cruelties to which hogs and cattle are yearly subjected on their way to market. It scarcely seems possible that these cruelties can go on much longer without the active interference of laws enacted and enforced by the humane sense of civilized society. On most railroads little or no conveniences have been provided by which cattle and hogs can be cooled and watered in course of transportation, and consequently in weeks of intense heat like those which have occurred this month of June, fat cattle reach Chicago and other markets half dead with thirst and fever; and swine equally thirsty and half suffocated, for those which are alive, and in a partial state of decomposition for those which have died on the way. That these atrocities will and do tell on the public health and remotely on the public morals, there can be no manner of doubt, and if in the near or remote future an avenging Nemesis should appear in the form of some awful epidemic, and devastate cities where these cruelties are practiced in their worst form, who could say the scourge was not applied where the scourge was deserved.

But it is a pleasure to be able to make the fact known that one railroad company in the West is far in advance of all others in providing for the health and comfort of live stock transported over its lines, and that is the Chicago, Burlington & Quincy railroad, a corporation owning and controlling many hundred miles in Illinois, and many more hundreds in Western and Southern States. The management has so arranged and ordered that it is within the power and pleasure of every shipper of stock to stop freight trains at any one of the numerous water tanks provided for the purpose, and there water or deluge the heated live contents of the cars by floods of water taken and conveyed by hose and other appliances attached to the tanks. The first consequence is that the animals reaching the Chicago market on the C. B. & Q. and its connections, arrive in better condition and fetch better prices than from any other line; and the second consequence is the value of the lesson that the humane and enlightened management of a railroad is pretty sure to be sooner or later associated with great financial success, for the stock and bonds of the company under notice, are among the best reputed and highest priced of the stock market lists. It is to be hoped the management of other lines will, as soon as may be, follow the example of the C. B. & Q. and before they are brought to it by the compulsion of statute law enacted and enforced.

AGRICULTURAL COLLEGES.—The faculties of some of these which have been under the domination of literary presidents and doctors of divinity, where the agricultural student has come to feel as the negro is made to feel at West Point, have accepted the criticism of the RURAL as an indication that the farmers of the country are in earnest in demanding a change in management, which will bring these institutions back to the point they departed from some ten years ago. They see, too, that the modern farmer, like him of old, is about to give up the throwing of grass and will begin even to throw stones and without much regard to those who will be hit or hurt in the *melee*. In course of this month there has been a sort of informal and private convention of many of the agricultural professors of the country at one of the centrally situated Western colleges. Just what was done or just what conclusions were arrived at, the writer has no sufficient information of, but it is plain an effort is about to be made by those at present having control, to lift these institutions from the literary insignificance into which they have fallen and make of them, what it was originally intended they should be made, institutions for *practical* and scientific instruction in agriculture and mechanics, and nothing else.

CORRECTION.—My wretched MS., I suppose is responsible for several errors of sufficient importance to require correction, to be found on page 407, issue of June 26, line 28 from the bottom, for "93 per cent." read "93 hundredths of one per cent., or .93" and for "25 per cent." read "2½ per cent., or 2.5." There are several other errors in the paragraph on *wire fencing*, the most of which will, if the piece is carefully read, correct themselves.

Champaign, Ill. B. F. J.

Dairy Husbandry.

HISTORY OF A POOR FARM.—No. 27.

Adjuncts to the Dairy.

"MILK, butter, cheese, pork and poultry, may be called dairy products" I remarked.

"What has pork to do with a dairy," sharply asked my old neighbor. "You are always saying that everything about a dairy should be perfectly clean and that no bad smells or filth should be about where milk is kept. How are you going to keep pigs clean I should like to know and have a pig-pen without bad smells?"

"That can be done too if one wishes," I replied. "There is no necessity to confine pigs in filthy pens. If cows were neglected as much as pigs are, they would be equally filthy. If the stables were not cleaned out twice a day, and the cows scraped and washed and carded, there would not be much to choose between the cow-house and pig-pen. How often do you clean out your pig-pens," I asked.

"Once a year," replied the old man;" I expect the pigs to make manure and the yard

is kept supplied with a load now and then from the cow yard for them to work up with swamp muck and such stuff; that was your idea, and it is a good one."

"I have mine cleaned every morning and fresh litter thrown in, and as the yard gets full it is cleared out and the manure is used in the field for the fodder crops; by doing this I make three times as much manure as you do. The pig-pen is painted white, has glazed windows and no one would know by any bad smell about it, that it was a pig-pen. But this is not the point I wanted to talk about. This is, how should all the wastes of a dairy be best utilized? There is always a lot of skim-milk, washings of cans, pails, and churns, buttermilk, and in my case, waste milk that has been left unsold in addition. In some dairies a good deal of whey is thrown away that might be used. Then there are wastes in feeding, for cows cannot be fed so close as to use up every particle of food, and the refuse should be utilized. Now you have said that it does not pay me to buy corn to make pork; that my pigs cost me 25 cents a pound for the meat; and my eggs 50 cents a dozen, and I know this is a very common opinion, but is not true, and I want to show you that it is not."

"Let us see about it," said Mr. Martin, "that is what I tell Mary, but she just shuts me up with a quotation from some book she has, which makes out that the manure is worth more than the food from which it is made; and that the pork is all profit. That is some of Fred's teaching I expect."

"I do not doubt that Fred is right about that and your daughter too," I replied, "but we won't talk about that now; let us leave that for another time. Let us figure up what a pound of pork costs to a dairyman. No doubt Dr. Jones can give us some help on this question.

"Let us go to the principle of it" said Dr. Jones. "It has been shown unquestionably that 28 grains of carbon per pound of live weight are needed to sustain an animal of 150 pounds in good condition under moderate exertion. A pig of 300 pounds weight when killed, would have an average live weight of 150 pounds from its birth, and therefore 28 grains of carbon a day, with the usual proportion (1 to 5) of nitrogenous food which should accompany this quantity of carbon in perfect food, as corn and milk, will be needed for each pound of weight. That will equal nine ounces of carbon, which I believe is equivalent to one pound six ounces of corn. This will simply maintain the weight. To add one pound of fat and flesh per day to this weight, there would be required two pounds of corn in which there are 3 84 ounces (12 per cent) of flesh-forming substance and 13.12 ounces (41 per cent) of fat-formers. The whole amount of corn required, then, to make a pound of pork seems to be three pounds, six ounces. If corn is purchased at 56 cents a bushel, or one cent a pound, a pound of pork should cost less than 3½ cents."

"A great many experiments in feeding have shown that about one-third of the food is returned in flesh, on the average; so that the Doctor's figures are corroborated by actual facts," remarked Fred.

"Then, if corn only was bought and fed to our pigs, the pork should cost 3½ cents a pound. For 100 to 200-pound pigs, which are the most profitable, I can get seven cents a pound. So that at this rate I have 100 per cent. profit, and the manure is a clear gain."

"But there are the wasted substances—the buttermilk, the skim-milk, the sour milk and the trampled fodder from the cows' feed troughs, all of which save so much corn, what are they worth?" asked Mr. Martin. "Mary's pigs get little else but these. One hundred pounds of corn-meal last her a long time; and why won't it pay to feed the pigs longer and have them weigh 300 pounds?"

"One thing at a time," I replied. "Seven pounds of skimmed milk or buttermilk are estimated to be equivalent in feeding value to one pound of corn. There are 12 pounds of solid matter in 100 of skim-milk, of which four pounds are flesh formers and 7½ pounds are fat formers, chiefly sugar. The mixture of some corn-meal with the skim-milk is an advantage to each; the one helps the nutritive value of the other. But the large proportion of nitrogenous matter in the solid part of milk increases its money value, and I believe this solid part of milk is nearly twice the value of corn for feeding a growing animal—as a young pig—so that I think four pounds of milk will be found equal in feeding value to a pound of corn-meal. At this estimate buttermilk or skim-milk should be worth half a cent a quart. It is often sold at one cent a gallon, for feeding pigs, by dairymen who don't know its value, and is a cheap food at that price. Fred has helped to find out the value of young pork, and can answer your other question."

"In Dr. Miles's experiments at the Michigan Agricultural College, some grade Essex pigs, a good feeding sort, were fed from two weeks old for 203 days or 29 weeks, in which time they gained 141 pounds in weight. At the beginning of the feeding the growth was more rapid than at the end, and Dr. Miles's conclusion was that the best return for food is obtained by liberal feeding in the early stages of growth, when the organs of nutrition are capable of converting the largest amount of material into flesh and fat in a given time."

"And I am sure he is right," said my old neighbor; "the most profitable pigs are Spring pigs fattened in the Fall and sold before the Winter. There is no Winter feeding then, which is a waste of food, for pigs don't grow in the Winter time—at least mine don't."

"Here is our last year's pork account, which shows that pork may be made a profitable product on dairy farms: The keeping of two brood sows and one boar is not included in the pork account, which takes in only the pigs when weaned and their keep up to their sale as pork. The pigs are pure Berkshires. I value a weaned pig at $5, and credit the sows and the boar with the value of the litters at that rate, and they pay a good profit, too, on their keeping, for they produce two litters in the year:

PORK ACCOUNT FOR 1879.

Mar. 7, 7 weaned pigs, estimated value	$35 00	
May 3, 6 " " " "	30 00	
Sept. 8, 3 pigs, 383 pounds pork sold at 7c.		$26 81
Sept. 11, 2 pigs, 371 pounds pork sold at 7c.		25 97
Oct. 12, 1 pig, 182 pounds pork sold at 6½c.		11 83
Oct. 18, 1 pig, 176 pounds pork sold at 7c.		12 32
Dec. 24, 3 pigs, 521 pounds sold at 7c.		36 47
Dec. 31, 3 pigs, 612 pounds pork sold at 7c.		42 84
1,120 lbs. malt sprouts at $12 a ton.	6 73	
2,322 lbs. corn at 1c. a pound	23 22	
864 lbs. bran at ¾c. a pound	7 56	
Balance (value of milk, etc.)	53 74	
	$156 24	$156 24

The average weight is 173 pounds nearly for seven-months pigs (here Mr. Martin smiled), and the money returned for waste milk and the rakings of the cow-barn—waste fodder, etc.—is $53.64. We kept no account of the milk used, and so cannot give the quantity of that."

"We can beat that," remarked Mr. Martin, "Mary shall show you her pork account." and Mr. Martin and Fred nodded to each other, and looked immensely pleased.

THE DAIRY COW.—No. 2.

HENRY STEWART.

What it Costs to Keep a Cow.

FEW persons know or believe how easy it is to keep a cow. One may feed two cows liberally for six months on the grass cut from half an acre, or less, of lawn, and an orchard of an eighth of an acre, with the help of garden waste and two or three quarts of meal daily. One ton of hay with the wastes of the house—as peelings of potatoes, apples and other vegetables—and half a ton of meal and a ton and a half of hay will liberally support a cow through the winter. If one lives on a road the side of which is covered with grass, he may lawfully and properly pasture a cow upon it by tethering her with a chain and an iron pin to be driven into the ground to secure it; or, with rare exceptions, one may procure pasture in the Summer from a neighboring farmer or owner of unimproved land or vacant village lots for a dollar, or two dollars at most, per month. Then one's land may be used for growing fodder for Winter use, and half an acre of good land will produce an abundance for one cow, so that the owner of one or two acres of land in the country or in a country village, may keep a cow at very small cost. The circumstances are so varied that estimates of this cost cannot be made precisely for every case. It may serve, however, to sum up the cost of everything, supposing all the feed to be purchased, and from that one may gather the exact information as to the cost in his own particular case by variations and substitutions. The following figures are taken from the account books of a milk dairy in which all the feed in one Winter was purchased and in the Summer the exact cost of the feed was ascertained with accuracy: Average cost of Winter feeding on hay, corn-fodder and meal in a dairy of 25 cows, 16¼ cents per day; cost of Summer feeding on soiling crops and meal, 12¾ cents per day. This will apply not only to the case of one cow, but also to that of the business dairy in which strict accounts are rarely kept.

To begin to estimate what a cow will cost to keep, the cost of the cow may be considered first. A very good common cow can be procured for $40 where cows are high-priced. An extra-bred cow, with everything handsome about her and fit for any family of high degree even, may be purchased for $75 to $150. When one has begun the business and has a cow, it is not much trouble to keep a calf, and it is often possible to buy a well-bred, handsome heifer calf, to save her from the butcher, for her value in veal. With a little extra care the little creature may be kept and trained as a pet, and fed until of a cow's estate for the sum of $25 or $30 or thereabouts. In this way one may procure a really handsome cow and one that "handsome does" as well as looks, and be gentle and kind and easily handled, at a very small cost. A fair common cow, but with no beauty, except, perhaps, in regard to her usefulness, and in the fullness of old age, may be bought for $25 or even less, and after having been milked out may be sold to a farmer for feeding for $15 or $20. This is a convenient method, as there is no trouble about calves and it is not difficult to "make a trade" when a fresh cow is desirable. It is convenient for the private family and for a milk dairy, as the loss on the wear and tear and exchange of the cow is small.

A cow may be fed for 20 cents a day and "live in clover," and for less if her feeding is somewhat less luxurious. But a cow needs good feeding for profit. The better she is fed, the better she will feed her owner, so that it is best always to be liberal about the feeding under any circumstances. A fair-sized cow will consume 15 pounds of hay and eight pounds of meal daily, or the equivalent of these. The following rations may be considered as equivalent to each other and as sufficient for a cow for 24 hours:

	Cents.
15 pounds of clover hay at $15 a ton	10½
8 pounds of meal at $20 a ton	8
	18½
10 pounds of corn fodder at $5 a ton	2½
½ bushel of mangels at 10c. per bush	5
8 pounds of meal at $20 a ton	8
	15½
10 pounds of marsh hay at $5 a ton	2½
10 pounds of corn fodder at $5 a ton	2½
10 pounds of meal at $20 a ton	10
	15

Allowing something for the cost of stable furniture, salt and other small contingencies, the average daily cost of keeping a cow will be 20 cents. If one grows the feed that is sold to the cow at the prices named above, the grower could thrive and grow rich if he did enough of it. This would be equal to $36 from Nov. 1 to May 1, which is the most costly period of a cow's keeping, and the above prices are rated as those current in the most expensive localities and at the present very expensive period in regard to feed; the figure is therefore a maximum one. The Summer feeding is much less costly, for grass is cheap and green fodder may be grown as cheaply as grass. But if it is considered that the Summer feed may cost so much as $24 even, the whole year's feeding, with everything purchased at the highest prices, will not reach over $60, which is considerably less than the yearly income, and leaves a large dividend to repay the first cost of the cow.

THE TRUTH ABOUT IT.

[THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

HAS OLEOMARGARINE INJURED THE DAIRY INTEREST?

BUTTER makers do not seem to appreciate the injurious effect which the manufacture of oleomargarine and the mixture of it with butter, which goes by the name of butterine, have had upon their business. Because it is not apparent, and their commission merchants do not plainly say to them when they return sales at a reduction of five or ten cents per pound, "This is because of the competition of oleomargarine," they do not seem to realize the facts in the case. Now it is very plain that if there are purchasers for a certain quantity of butter at a certain price, and just so much butter, and no more, is made as will supply these purchasers, the price will remain steady. But let a competitor come with a cheaper article and say to half those purchasers. "I will supply you with this butter at 10 cents a pound less than you have been paying," immediately the other half will claim an equal reduction, if indeed, the butter makers with twice as much goods to dispose of as there is demand for at the old price, do not begin to compete among themselves and reduce their prices with a view to increase the consumption. Then the measure of the reduction is the ability of the dairyman to produce butter at a certain price, and that is the cost or very little more than that. This seems to be plain, and it is "the truth about it." When butter fell last year to the lowest prices for many years, can we suppose that the enormous production of oleomargarine had nothing to do with that? When the market was crowded with goods seeking purchasers, did not the thousands or hundreds of thousands of tubs of bogus butter offered and sold as butter, help the downward course of prices and assist in overstocking the market? Any dairyman who cannot perceive this, must be blind indeed.

"But" says the fancy-butter maker, "it does not hurt me, and my goods are of the highest quality and do not come into competition with the bogus butter, or with low common stuff at all." Let us see if it does not. Take the market rates and consider. There are regular gradations of price from 24 cents for "choice creamery," dropping one cent per pound for each grade down to "very poor" at 10 cents Let it be supposed that the "very poor" only is subjected to the competition with oleomargarine, as the "gilt-edged" butter maker may claim. What then? "Very poor" tumbles down four or five cents a pound because the large consumers of it, hotels, pie bakers-cooks, boarding-houses and ships, would rather take sweet oleomargarine than the rancid, ill-flavored, very poor butter which disgraces its name, and the profession of the dairyman. When "very poor" falls off so many points, "poor" is dragged down with it; with "poor" down comes "ordinary" and that clings to "medium" and this to "prime" and when prime falls off, the buyer of "choice" says "How is this, I cannot give 30 cents for choice when prime is only 22, the usual difference is only two cents. I will give two cents and no more."

The loss of six cents on "choice" then is due clearly to the interference of the substitute which makes the lowest grade unsalable. This seems so clear that one may very well apologize for stating it, but many of the best butter-makers have said, "This is a fight for the poor-butter makers; we are not in it; you may count us out." They are very much mistaken. My own customers are private families who are willing to pay 10 or 15 cents more than the highest grades of butter sell for at the stores. When store butter comes down, these claim a corresponding reduction, and in some cases I am bound to make it. Oleomargarine then takes money out of my pocket; and, if so much more does it take it from the creameries and the best private dairies that go into the open market. Cannot these see that this is "the truth about it."

But I am sorry to say that the hands of some dairymen are not clean in this matter. There is the very best reason to know that a large portion of the "oil" goes to the creameries to be mixed with butter and to be worked in with skimmed milk to make "full milk" and fine cheese. And yet some of these very men will join in the cry against those who openly acknowledge their dealings in oleomargarine, and denounce those persons as mischievous frauds. If I have an adversary, give me one who fights openly and not in concealment or in the guise of a friend; and it is a startling truth that the worst enemies of the honest dairyman in regard to this competition are "those of his own household." H. S.

The Herdsman.

ENGLISH JERSEY HERD BOOK.

THE first volume of the English Jersey Herd Book, edited by John Thornton, has just been published in London. This is an entirely distinct work from the Herd Book published for years past in the Island of Jersey, and it records only Jerseys which are bred in Great Britain and Ireland. This volume contains 973 bulls; cows and heifers are retained for a second volume.

To show how rapidly Channel Island cattle are increasing in England, only one, a bull, was exhibited at the Royal Agricultural show in 1839, while 292 were entered and shown in that of the past year. The advance in prices at auction sales of these has also greatly increased. The one which came off in 1865, averaged only £25, 15s. 4d. per head, while another in 1878, rose to £51, 1s. 9d.

Mr. Thornton in this volume has given a history of Jersey cattle as known in their own Island home, as well as in England. Nothing positive can be told as to their origin, but it is supposed by him to have been in Brittany, on the opposite coast of France, as native cattle resembling them are still found there. Another reason, if he had known it, which might have been adduced to corroborate this, is, that many of the native cattle, among the French inhabitants of Lower Canada, are precisely like ordinary Jerseys. Now many of the ancestors of these people came from Brittany among the earliest settlers in Canada, and unquestionably at this time brought the ancestors of their present cattle with them.

I have seen hundreds of cattle in the mountainous parts of Switzerland, mostly of dark, solid colors, closely resembling Jerseys, except they were larger and somewhat coarser. I was informed that they gave abundance of extra-rich milk. Napoleon III had a considerable herd of these in his dairy near Paris in 1867. The great fault of their shape I observed was a coarse ridge of bone and brawn running from the root of the tail on to the loins, an unsightly excrescence to my eye; otherwise they were rather nice-shaped beasts. A.

Sussex Cattle.

THESE are thought to be a cognate breed with the Devons, but are considerably larger and somewhat coarser, and slower to mature. Yet improvements in these seem to be the order of the day in England, which has at length reached such a point as to demand the getting up of a Herd-Book for their record. The first volume of this was published last year, and they are now at work on the second. Formerly animals of this breed could not be matured till four to five, and even six years old; now they are made ready for the market, weighing just as much at half these ages. This enables

their breeders to turn the capital invested in them, in half the time before consumed, and adds an additional profit in raising them.

We recollect seeing an account in the English papers some years ago of a Sussex breeder who had such a conceited estimation of the superiority of his cattle as to challenge any herd of Short-horns in the Kingdom to be shown against them. The late Earl Spencer immediately accepted the challenge for his own herd; judges were then appointed and the rival animals brought into the ring. Upon careful comparison of the two breeds, side by side, the Short-horns were declared to be much superior, to the great mortification of the Sussex breeder. They have since this been so greatly improved as to be considered now among the best of the second rank of England's beef cattle, and in time may probably take their place among the first.

Arboricultural.

RAINFALL AND FORESTS.

A RECENT article in the RURAL reiterates what has been constantly preached for several years past—namely, that the destruction of forests causes drought. This is constantly stated to be susceptible of proof—and, to use the expression of the present age "scientific proof." Science has the exalted place now-a-days, and proof is no proof unless it is scientific. Why this drought effect of the destruction of forests is so often reiterated I cannot imagine, since no one seems to doubt it. Never have I seen the least contradiction of this philosophy. And this seems strange to me since facts do not favor it in the broad extent of our country. There are two notable facts that afford such clear proof to the contrary, that apparent proofs of the theory drawn from narrow, isolated sections cannot affect them. The first is this: In Indiana, Illinois, Wisconsin, Minnesota, Iowa, Missouri, Kansas, and Nebraska there is a region, in area, say, 300,000 square miles, that is now and has been while known to the white man, practically treeless, and it is a recent discovery that this vast extent of country is a desert. For, taking this theory that the loss of forests causes drought, and drought, sterility, it follows that we are mistaken in thinking that we live in a fertile plain that groans with millions of bushels of corn and wheat and other productions that cannot thrive without the proper amount of moisture.

What has been the fact in regard to this vast region? It is that, without forests, it has had from time immemorial as large a rainfall, on the average, as those States which are largely covered with forests. Is there any possible way to get around that fact? It will not do to point to droughts that have prevailed from time to time in varying localities. They do not militate against the great truth stated; for they were *local*, and, besides, droughts have prevailed similarly in wooded districts.

The next great fact is, that our rainfall does not come, to any considerable extent, from the evaporation of moisture from the surface of the land, held there by the forests and liberated as needed according to this theory; but from vast masses of vapor projected over us, drawn from the Gulf of Mexico and the Pacific Ocean, and which by natural laws are precipitated on us, regardless of wide prairie or thick forest. These two facts, it seems to me utterly destroy the theory.

How does experience affect the question, looking at it from a local point? In Indiana and Illinois, and perhaps in a larger extent of country, our seasons were dry for several years previous to 1875. Then we had a flood, and for five years past there has been an abundance of rain. In those dry years it was common to cry out about the cutting away of the forests. Have the forests come back, that we lack not for moisture?

Here we are suffering from rain—farmers (this middle of June), in some parts have not been able to get in their corn, and one flood follows another in our bottoms. In the East you have been burnt up. How about the forests—are ours growing and yours lessening so rapidly?

This is only another instance of arguing from hand to mouth, as it were. J. A. F.

433. Quinnipiac Fertilizer Co.'s dry ground fish, sold by J. M. Belden, New Britain, sent by E. F. Blake, New Britain.

391. Dried blood, made by Sperry & Barnes, New Haven, sampled and sent by R. E. Pinney, Suffield.

392. Dried blood and hair, made by Strong, Barnes, Hart & Co., sampled and sent by R. E. Pinney.

439. Dried blood, manufactured by Strong, Barnes, Hart & Co., New Haven, sent by J. J. Webb, Hamden.

	432	433	391	392	439
Nitrogen	14 50	8 14	8 20	8 80	8 25
Phos. Acid	0 15	7 28	6 02	3 55	6 41
Estimated value per ton	$43 71	$42 75	$33 23	$36 63	$41 07
Cost per ton	$30 00	$38 00	$26 00	?	$30 00

BONE.

434. H. J. Baker & Bro.'s strictly pure ground bone, sent by J. J. Webb, Hamden.

440. Ivory saw dust, manufactured by F. S. Johnson, Plainville, sent by J. W. Hemingway, Plainville.

441. Bone sawdust, made by Holyoke Manufacturing Co., Holyoke, Mass., and sold by R. T. Prentiss, Holyoke, sent by J. W. Hemingway, Plainville.

442 and 443. Ground bone, made by Atwood Bros., Watertown, sent by M. S. Baldwin, Naugatuck.

	434	440	441	442	443
Nitrogen	3 94	5 42	3 64	3 76	4 29
Phos. acid	19 56	24 38	26 16	20 02	21 95
Passed holes 1-50 in.	40	94	87	2	27
" " 1-25 in.	29	6	11	11	26
" " 1-12 in.	28		2	20	23
" " 1-6 in.	3			23	14
Coarser than 1-6 in.	1			43	10
	100	100	100	100	100
Estimated value per ton	$39 13	$53 44	$49 24	$33 96	$40 80
Cost per ton	$31 50	$30 30	$35 50	$30 00	$30 00?

442 and 443 are respectively the finer parts of the same ground bone.

The finer bone, 443, is seen to contain more, both of nitrogen (0.5 per cent.) and of phosphoric acid (1.9 per cent.) and partly for that reason and partly for its fineness it has an estimated value nearly $7 greater than the coarser bone, 443.

POTASH SALTS.

428. Sulphate of potash, H. J. Baker & Bro., New York, sent by Mr. P. M. Augur, Middlefield.

438. Muriate of potash, sold by H. J. Baker & Bro., sent by J. J. Webb, Hamden.

	428	438
Potash	47 37	52 18
Sulphate of potash	87 60	
Muriate of potash		83 50
Estimated value per ton	$71 06	$46 96
Cost per ton	$65 00	$40 00

PLASTER.

414. Land plaster, manufactured by E. B. Alvord, Jamesville, N. Y., sold by S. A. Weldon & Son and sent by S. R. Gridley, President of the Farmer's Club, Bristol, Conn.

419. Gypsum or land plaster, Nova Scotia(?) ground and sold by George Abbott, Branchville, Conn., sent by D. H. Van Hoosear, President Farmers' Club, East Wilton, Conn.

431. Plaster, manufacturer unknown, E. N. Pierce, dealer, Plainville, Conn., sent by T. N. Bishop, Plainville.

	414	419	431

Carbonate of lime, by difference	17 08		17 03
	100 00	100 00	100 00
Cost per ton	$7 50	$6 00	$7 00

S. W. JOHNSON, Director.

NEW JERSEY AGRICULTURAL EXPERIMENT STATION.—3.

ANALYSES OF LAND PLASTER.

THIS substance has been very extensively used in New Jersey as a fertilizer. It was formerly thought to be almost indispensable for producing a good crop of clover. It is not so much used for that purpose now, though employed to some extent, but is found beneficial in hastening the germination of seeds, in promoting the growth of young corn and potatoes. It is much used on composts for absorbing or decomposing gases and for hastening the decay of coarse manures.

The supply of plaster for this State comes mostly from Central New York or from Nova Scotia. That from New York is commonly of a grayish color, and besides the sulphate of lime and water which are its proper constituents, it contains some carbonate of lime, some carbonate of magnesia, and other impurities. The Nova Scotia plaster is white and usually contains only a small percentage of any impurity.

Pure plaster is composed of—

Lime	32.6 per cent.
Sulphuric acid	46.5 per cent.
Water	20.9 per cent.
	100.0

When the plaster is heated a little above the temperature of boiling water, it gives off the water that was combined with it, and is then known as boiled plaster or plaster of Paris. This is the plaster which sets and becomes stone again when it is thoroughly wet with water, and is used for making plaster casts, cornices, hard-finished walls, etc.

In addition to the chemical names of calcium sulphate and sulphate of lime it is also called gypsum. As a mineral it is known as alabaster and selenite, and when found as it is sometimes without water in it, it is called anhydrite. It is so soft as to be scratched with the finger nail, and it dissolves slightly in cold water, about one pound of it dissolving in 60 gallons of water.

Plaster for farmer's use is to be found in all our markets.

The following samples have been sent to the Station for analysis and they are the kinds most commonly sold.

The comparative value of these samples is calculated very nearly by assuming that pure boiled plaster is worth $10 a ton or a half-cent a pound. This price would make the value of the specimens to be set down in the table.

	(2.)	(3.)	(4.)	(5.)	(25.)
Sulpuric acid	44.64	29.52	45.14	45.08	56.47
Lime	31.24	20.66	31.59	31.56	39.56
Sulphate of lime	75.88	50.18	76.73	76.64	96.03
Water	20.08	13.32	20.33	20.28	00.00
Value per hundred	$0 38	0 25	0 38	0 38	0 48
Value per ton	$7 59	5 02	7 67	7 66	9 60
Selling price	$8 00	7 00	9 00		8 10

(2.) Sent by S. L. Burrough, of Merchantville, from the stock of Fitzgerald & Co., Camden. Its brand is pure Nova Scotia land plaster, and its price $8 per ton.

(3.) Sent by I. W. Nicholson, of Camden. Cayuga Plaster Co., Union Springs, N. Y. Delivered at Haddonfield, by car-load, at $7 a ton.

The analysis accompanying the plaster gave its percentage of pure gypsum as 80.78 per cent.

(4.) Sent by William C. Nicholson, of Haddonfield, Brand, land plaster. From stock of Taylor Bros., Camden. Price, $9 per ton.

(5.) Sent by Hon. E. Burrough, Merchantville. Brand, French's land plaster. From stock of French, Richards & Co., of Philadelphia. Price not given.

(25.) Sent by Samuel L. Burrough, Merchantville. Brand, Nova Scotia land plaster. From stock of W. Fitzgerald. Price $8.10 per ton. Of these specimens, two, four and five are samples of Nova Scotia, 3 is a sample of plaster from central New York, and 25 is a sample of boiled plaster or plaster of Paris. Their values in the table are estimated by considering the sulphate of lime as the only substance desired by the farmer in buying them.

The Cayuga plaster is perhaps worth a little more than this estimate, on account of other substances in it, and the boiled plaster may not be worth so much as estimated on account of its liability to *set* if it should be wet before the time for using it.

The dressing used for an acre is very small, from 100 to 300 pounds. This may be the reason that the poorer plaster gives as good results as the best. But if so the dressing of the latter may well be diminished in amount.

GEO. H. COOK, Director.

Miscellaneous.

WHAT OTHERS SAY.

THE CREDIT SYSTEM.—We find the following in Dr. Hoskins's department of the Vermont Watchman: "The RURAL NEW-YORKER, like the faithful farmers' paper that it is, has for the last two years enforced in a series of able articles the evils of the credit system, and has expressed the desire to see it abolished. A recent writer of the Country Gentleman thus speaks of this Moloch: 'Land-poor, beggared, crushed under the load of a thousand acres, might be written as the epitaph of many a lost home. But time, which cures all ills and corrects all abuses, is freeing the debtor, and at the same time the wheels of business and prosperity, which have been so long clogged. Indebtedness, like a malignant disease, must, if not removed soon, prove fatal.' A striking instance, but only one in a thousand, of ruin thus worked is the case of Thomas Baker, who for the last twenty years has carried on one of the largest, best and most profitable dairy farms in Orleans county, and whose fine herd of Dutch cattle has so often been a feature of our State fairs. In the 'flush times' he could have sold his land, paid his debts and had $15,000, with all his stock, implements and household goods clear. Within a year the whole has passed into the hands of a mortgagee, leaving Mr. Baker with hardly enough to carry him and his family to the wilds of Dakota. Mr. Baker has always been a prudent, hard-working man, and has sold his large product of butter at extra prices. His wife is a model dairy woman. But they had to go down under the weight of a $15,000 mortgage. He now writes from the wilderness his last word to the young farmers of Vermont, 'Don't go in debt for land."

AGRICULTURAL EDUCATION.—What, (asks the London Gardeners' Chronicle) said Mr. Church the other day, at the Congress held at the Royal Agricultural College at Cirencester, on the occasion of a thoughtful address of Professor Tanner? Was he not right when he said that the bulk of British farmers—and the same remark applies, in its way, to British horticulturists—are entirely ignorant of what has been done for their benefit by Messrs. Lawes and Gilbert at Rothamsted? Was he not right when he pointed to the results obtained in sixty-two experimental stations in Germany, fifteen in Austria-Hungary—127 stations in Europe generally, and asked how much our British cultivators had profited by them? What are our horticultural societies about? Is it well that their labors should practically be confined to the establishment and conduct of flower shows? The countries we have named are right, and we are wrong. We are tamely letting them get the better of us, and complaining of bad seasons and hard laws, all the time doing next to nothing to meet the altered circumstances. Scientific training in the Universities for those who are to become possessors of estates or managers of property in the future, chairs and classes of agriculture, botany, physiology, physics, chemistry, geology, entomology—all these are wanted, and should be supplied in our great Universities and elsewhere, with special reference to practical needs and requirements. For the working classes of the board school or the village school should furnish the basis, not only of a common education, but also such a knowledge of the soil, the air, the waters, the plants and the animals as may be made available in the daily routine of the farm or the garden. We cannot too emphatically repeat our conviction, that progress in gardening and farming in the future depends far more on the results to be got from a thorough training in the various branches of natural knowledge, than it does in any readjustment of land laws or lightening of fiscal regulations. These are, as it were, local accidents—limited in their area, restricted in their range, but Nature is universal, the application of a knowledge of her laws to the business of life is limited only by the finite faculties of man.

SOIL EXHAUSTION.—The following is from the pen of Dr. J. B. Lawes to the London Ag. Gazette. It should be carefully read by all farmers. "It is now exactly forty years since we began to exhaust a portion of one of my fields by continuous unmanured wheat crops, it may therefore be interesting to show the evidence we are in a position to bring forward upon the subject of exhaustion as regards the soil at Rothamsted. It would appear probable that the annual decline due to exhaustion may amount to from one-quarter to one-third of a bushel of wheat per acre per annum. If we take the smaller quantity and add to it the ordinary proportion of straw, the result would be equivalent to about 40 pounds of produce; and, as there is but little doubt that the bulk of the organic matter of the crop is obtained from the atmosphere, the amount of matter annually taken from the soil by these 40 pounds of produce (including the nitrogen it contained) would be between two pounds and three pounds. The evidence derived from other experiments in the same field proves that the decline in produce is due to an absence of nitrogen, as also that minerals are in excess, but the actual amount of nitrogen that these 40 pounds of produce would have contained would be less than one-half pound in weight! It will, I am afraid, appear to your agricultural readers something like an absurdity to suppose that one-half pound, more or less, of any substance upon an acre of land, could have an appreciable influence upon a crop. I may observe, however, that this annual decline of 40 pounds of produce, small as it appears to be, amounts in forty years to 10 bushels per acre. Analyses of the soil made at different times show that the nitrogen is declining, and as the free use of minerals in an adjoining experiment does not prevent the decline of the crop, we can come to no other conclusion, than that the gradual decline in the produce is due to the diminishing amount of nitrogen in the soil. As far as the wheat crop is concerned, it would appear that the total amount of produce to be obtained from any soil must depend very much upon the stores of nitrogen already in the land. It is true that the soil obtains a certain amount of ammonia from the rainfall, and it probably condenses more or less from the atmosphere; but, on the other hand, drainage carries away every year more or less nitrogen in the form of nitric acid; and it is evident the atmospheric supply, whatever it may amount to, does not suffice to prevent a decline of the crop; it is therefore also evident that the source, from which the forty crops obtained their supply, must have been the stores of nitrogen already existing in the soil when the experiment commenced; further, it seems most probable that the yield of future crops will depend upon the amount of nitrogen liberated each year from the soil."

FEEDING CALVES.—"Mr. O. S. Bliss," the N. Y. Tribune says, "who has tried all ways of raising calves, prefers uncooked food, and especially a mixture of ground oats and barley, to any other addition to the skim milk. He begins with a small quantity, fed dry, and gradually increases it after a week or two; when the calf is four to six weeks old it is allowed to have all it will eat of this meal, given just after it has taken its milk, with, afterwards, all the pure water it will drink.

MR. GEDDES, according to the Syracuse Journal, using plaster on potatoes on alternate rows, found that the vines where a handful of plaster had been thrown gave double the yield of potatoes and double the size of vines in an unusually dry year.

A WRITER in the London Garden traps field mice by placing bits of cheese in bottles sunk in the soil, rather on the slant, the mouth on the level of the ground.

THE OLEANDER POISONOUS.—It is stated that the oleander "is a deadly poison, and may frequently prove a treacherous fondling if not carefully watched. It is one of our most beautiful window plants when covered with its large rose-like blossoms, but in these blossoms the weapon of death resides." A case is recorded of a child having eaten a few flowers and being poisoned by the same. The Annals of the Peninsular War states that "a number of French soldiers went out foraging near Madrid, returned laden with the fruits of their search. One of the number, with a view of securing some wood to make skewers for the meat, cut a quantity of oleander bows, and, having stripped them of the bark, used the wood in the meat. The result was, that out of twelve who ate of the roast seven died, and the rest were dangerously ill. The poisonous principle is so subtle that its exhalations alone are sufficient to cause serious accidents, and even death, to those who recline or sleep for any time under their influence. It exists equally in every part of the plant, but it is considerably weakened by cultivation."

KNOWLEDGE.—We commend the following remarks of Prof. Wrightson, president of the new English Agricultural College. The question of the ignorant and of the self-sufficient is ever, "Of what use is that?" But, it is very difficult to say what is of use and what is not of use. Knowledge is powerful and knowledge is portable. It dwells with us after we have received it. It fructifies in us and throws its light on subjects with which we may find ourselves brought in contact. Knowledge is suggestive, enabling us to offer explanations of the unknown from the known. Knowledge is the best safeguard against foolish statements and false arguments—the best defense against the wiles of quacks and impostors. Be careful, I say, of the seductive spirit of laziness which prompts you to question the usefulness of any subject. The most learned men never feel that they know enough, and there is something ennobling and fascinating in the clear perception of a new fact in natural science, which amply repays the trouble of acquiring it, even if it went no farther.

As previous numbers of the RURAL NEW-YORKER will show—we fully indorse the following from Colman's Rural World: While we are on shrubs, let us not forget an old favorite of ours, the Hypericum Kalmianum, or Laurel-leaved St. John's Wort. It is a native of our stony hillsides; in bloom from July to September; forms a very dense, round shrub, about two to three feet high; its glossy foliage is fine for bouquet green; its yellow blossoms are very delicate and beautiful and furnish an abundance of honey for the bees for several months. Bee-keepers should not neglect to plant an abundance of it near their bee stands, and it also makes as beautiful and ornamental a hedge as can be found. Its only drawback is that it is a native. It is neither Russian, Japanese, Chinese nor English, but simply a native American, and of course not fashionable or desirable on that account. It is neither far-fetched nor dear-bought, and therefore will not sell among native Americans.

THE WEEPING MOUNTAIN ASH has probably received as much attention as any weeping tree, on account of its distinct habit, says Mr. Wm. C. Barry. A careful examination of its mode of growth cannot fail to excite wonder. If worked two or three feet from the ground and allowed to grow wild, it soon becomes as odd a piece of framework as it is possible to imagine. I have an indistinct recollection of one I saw growing in this manner, and at the time I considered it as great a curiosity as I had ever seen. Grafted six to eight feet high, it becomes a very desirable lawn tree, and in the Autumn, laden with large clusters of bright red fruit, it produces a brilliant effect.

"FANCY FARMING," in the usual sense of the term, says the New York Evening Post, is almost always the sure road to financial ruin. It requires a fat purse to experiment with costly breeds of cattle, sheep and fowls. Much, however, is thus learned, and the more wealth and intelligence that are turned toward the improvement of stock, the better it is for the farming community generally.

PARTISAN VITUPERATION.—"The political campaign just opening," says the Husbandman, "promises to be abusive, slanderous and disgraceful in its treatment of candidates. The blackguardism of politics has become so shameless and reckless in the last few years that it is nothing less than a national disgrace. A candidate for a high office may have had a spotless character up to the moment of his nomination, but that will not shield him from attack. He will be pictured as a monster of vices, and the public will be invited to consider specific charges of wrong in which he has been profiting. His good name will give him no protection among those who revel in political slanders. Is it not possible to reform politics in this respect? Are partisans wholly destitute of honorable consideration for their opponents?" [Yes, as a rule, we think they are.—EDS.] "It is extremely hurtful to the moral sense of the people to be regaled on lies that have the plausibility of truth, and are offered in disparagement of men selected for high official positions."

SELECTING SEED.—Mr. Geddes says: "If farmers would exercise as much care in selecting seed wheat as they do in corn, there would be less running out." "This is a fact," says Prof. Blount in the Country Gentleman, "and I am surprised that more farmers do not see it. In my experiments with corn, I have tenaciously held the fact that the top ear bears the only seed suitable to plant, and as tenaciously do I hold that there is only one head in each stool of wheat perfect enough to keep it from deteriorating. Another reason why wheats run out, is that as long as farmers take their seed from the common granary, so long will it diminish in yield. They may sift it, sling it across the barn floor, and run it through a hundred sieves, and it will still deerease. Not until they exercise the patience and science of hand-picking a bushel or two every year from the top heads of the best stools, and sowing them alone on some choice lot for seed the following year, will they escape the degenerating influences of bad, unremunerative crops. Wheat is so remarkably sensitive that it receives the slightest attention most kindly; and, on the other hand, the presence of any foreign plant (even another kind of wheat), weed, fly, bug or worm, takes from it its life to such a degree that every farmer loses many bushels annually."

ANOTHER INSECTICIDE.—It is by no means labor thrown away, even when there is a doubt of realizing any benefit from a claimed recipe for a good purpose. We can try it, and hold fast if it should prove of service. We have before us (says the Germantown Telegraph) what a German gardener declares is a remedy for destroying the black or green flies, caterpillars, etc. It is simply to take the water in which the stems of the tomato-plant have been boiled, and sprinkle it, when cold, with a syringe, over the plants affected by these or other insects. It not only *kills* the insects, but leaves an odor which prevents others from coming. We may also mention that the juice of the tomato itself will quickly remove all stains from the hands, etc.

Everywhere.

SUPPLEMENTARY CROP REPORTS.

CAL., Santa Rosa, Sonoma Co.—Wheat, average crop. Corn, late planting and poor prospects; Spring cold and wet. Potatoes promise fairly. Oats, rye, and barley, average yields. Varieties of wheat: Oregon Club, Chili, Australian and Smith's Club principally. The acreage in small grain is about 10 per cent. more than in 1879. The comparative acreage, each with the others, in small grain in this county is about 60 per cent. of wheat; barley, 25 per cent.; oats, 10; rye, five. Average yield of wheat in bushels, say 20 per acre. Prospects for fruit, the poorest for seven years. All sorts, except plums, will scarcely yield anything. Best Summer apple, Red Astrachan; best Winter, Newtown Pippin; best pears, Barlett and Winter Nelis; best peaches, Alexander, Crawford's Early, and Smock. Grapes will be an immense yield, promising over 2,000,000 gallons of wine for 1880 in Sonoma county alone. J. B. A.

CAL., San Gabriel, Los Angeles Co.—In this county the harvest will be excellent. Barley is the principal crop; wheat ranks next, the Odessa wheat being the variety usually planted on account of its not rusting. The Early Rose is the variety of potato generally planted. The acreage devoted to small grains is probably one-half more than last year. Sugar cane is not grown. A number in the country, however, are growing the sugar beet for sugar. Fruit prospects are good; we grow almost all kinds here, from oranges and lemons to the Northern fruits. Oranges, lemons, grapes and peaches, are raised in larger quantities than other fruits, though plums, pears, apples, quinces, apricots, nectarines, &c., &c., are all grown here, and bear well. A. P. A.

FLA., Lee Park, Waldo Co.—Cotton in this section of Florida is not a promising crop. The early part of the season was unfavorable, and many farmers plowed it under and fell back upon rice. In a few places—and these are always under negro cultivation—I have seen some good patches of cotton, but it is doubtful whether, even if the remainder of the season be favorable, the yield will reach to more than 70 per cent. of the old average. A slightly increased area has this year been given to sugar, and the cane generally looks well. Oats have been—well, a failure. Seeing the way they were likely to turn out, I early plowed mine under and sowed sorghum for fodder in their place, and I have had no reason to regret the plan. The value of the Early Amber variety as a forage plant is not sufficiently understood. The area of rice is larger this year than last, and will be much further increased next year. It looks well, and farmers are beginning to see that it is their safest and one of their most profitable crops. The absence of machinery for cleaning it has been a drawback, but that is being remedied. This is the "off" year for oranges; but do not, on that account, think that there will be any deficiency in the supply. So much has been done of late in the making of orange groves that new trees are every year coming into bearing, so that, although individual trees may not be as heavily laden as last year, the crop that is destined for Northern markets is probably larger than ever. Bananas are early and good, the warm Winter having spared the plants over a much higher range than usual. Corn promises well. Some fine ears were brought me to-day, pronounced ripe, the first of the season in this neighborhood. Tobacco is being more largely cultivated. Some grown experimentally last year was not distinguishable from the best Havana, and there are now 40 or 50 acres in this immediate vicinity showing as fine a product as can be seen anywhere. Sweet potatoes—the great stand-by of so many in Florida—are as yet in an early stage, but they are growing fast and promise well. Of wheat and hay we have none—I wish we had. I have an experimental plot of Teosinte that is looking so fine as to give me great faith in its value. A. I. E.

IDAHO, Bois City, Ada Co.—This county raises from 150,000 to 200,000 bushels of all sorts of grain. Little or no sorghum is grown here. All fruits grown here will give fine crops this year. But little corn is raised here. R. B. W.

ILL., Volo, Lake Co.—Wheat is rusted; flax is good; corn splendid; potatoes good; very few beetles; hay heavy, except clover, which was winter-killed. Apple trees loaded; small fruit plentiful. Sheep and dairy goods are the leading products of this county. The oat crop very heavy. Mold's Ennobled oats look splendid. The Golden Ovoid mangel is doing well. I had to pull up some to thin them out. The seed was first-rate. I planted the Laurel-leaved willow on high, dry ground, and it is growing first-rate, the sprouts being 20 inches long. The Cuthbert raspberries are growing nice. Abies Siberica came up in the beginning of May. I removed the glass, but did not shade enough; in two days it became very hot and the plants died. T. D.

ILL., Mt. Palatine, Putnam Co.—Wheat nearly a failure. Oats are so far all right. Corn is the leading grain for this part of the country, and is well advanced and doing well. Potatoes are in good condition and doing well; free from bugs. Fruit better than last year. RURAL.

IND., Warsaw, Cosciusko Co.—We are right in the midst of the wheat harvest; the crop is about an average one; the quality will be No. 1, if wet weather does not hurt it. The acreage is 25 per cent. larger than in other years. Corn looks very well for the season. The wet weather has hindered a great many that have clay land from cultivating it as it should have been done, and now that clover haymaking and wheat-cutting have come, they cannot give it the attention it should have. Oats are good. Potatoes are a fine crop, taken at large, but they are not grown very extensively here. Fruits of all kinds are fair crops, with the exception of gooseberries and currants, which the worms have completely destroyed. Our chief varieties of wheat are the red Blue-Stone, Fultz, Wagoner, Buckeye, Lancaster, Clawson—all red but the last. Of oats we grow Excelsior, and the common white. Of potatoes the favorites are the Early Rose, Red Peachblow, Peerless, and Snowflake. Of wheat the red Blue-Stone and Wagoner have proved to be the best, all things considered; of potatoes, the Early Rose and Peachblows; and of oats, the Excelsior; of apples, Rambo, Yellow Bellflower, Seek-No-Further, Vandevere, Ben Davis, Baldwin, Maiden's Blush, White Winter Pearmain, and Neverfail; of cherries, the common red. Sorghum is not grown to as great an extent as it was a few years ago. I do not think that we understand how to handle it to make good sirup. I am trying a small patch this year of Early Amber. It is the first cane that I ever planted, so it is an experiment with me. I am also experimenting with mangel-wurzel and American Rutabagas. This is the first time I have tried to raise roots in the place of grain for stock. Farmers here are prosperous, and our State is improving rapidly. G. A. T.

IND., Auburn, DeKalb Co.—Wheat, good, mostly Lancaster and Fultz. Corn, a very good stand on upland, but small on low land; it is drowned. The oat prospect is good. Grass, an average crop. Potatoes ditto. Of rye and barley, very little is sown, but that is good. Of sorghum too very little is planted. Apples, a light crop. Pears, peaches and small fruits good crops. Acreage under wheat, large; corn, small; oats, average; potatoes, average. W. J. W.

IOWA, Letts, Louisa Co.—Crop prospects are good in this section. Winter wheat will be rather light owing to its freezing out last Winter. Spring wheat is about an average—the acreage, however, is less than common. Rye, good; most of it is in shock. Oats look fine and promise a large yield; the acreage is somewhat greater than for some years past. Corn is looking very well. The month of May was dry and it did not all come up at once, and it looks quite uneven; the acreage is as large as common. The prospect for a crop is as good as in years past. Potatoes look well, the earlier kinds are now fit for use. Almost all kinds of fruit will be plentiful, except late cherries, which were injured by late frosts. All crops on the bottom lands in this part of the State are nearly ruined by high water. There will be an abundance raised on the high lands to fill the place, and yet have a surplus to spare for the Eastern market, with some over for the needy Irishman. The seeds from the RURAL office are almost all growing, and look well. Out of 11 Tellephone peas five were weevil-eaten and did not grow. Those that grew are now ripe and I am pleased with the looks of them. The Cuthberts will bear a few berries this season, so we will see what they are like. WM. M. N.

IOWA, Burlington, Des Moines Co.—We are just in the midst of harvest here. Fall wheat will make a half crop; that is, what was not plowed up in the Spring. There was a good deal of it plowed up and sown to Spring wheat or planted to corn. Spring wheat is pretty good; the Chinch bug hurt it somewhat, but there is not much sown. Oats look splendid and are just beginning to ripen; there is a pretty large acreage. Corn is as good as people could wish it. In this section we have had very nice weather all Summer. Hay will be a very fair crop. Apples are abundant and of good quality. Of peaches we have none worthy of note. Small fruits have been very plentiful. My Ennobled oats are very rank; owing to being sick I did not get them sown until late. Mangels are doing fine. W. P. P.

IOWA, Manchester, Delaware Co.—No wheat raised here this year; oats and potatoes good; corn backward owing to heavy rains, but looking well; rye good, also barley. Our corn is the yellow sort, and white Dent—mostly yellow. Potatoes, Peachblow and Early Rose. More corn is planted than of any other grain; oats next; then rye, barley and wheat; small amount of sorghum. We do not raise more than half the fruit we consume here; what orchards there are will bear well, as this is a good year for fruit in this locality. C. J. B.

IOWA, Prescott, Adams Co.—Wheat promises a fair average yield—acreage about 10 per cent. less than last year. Oats fair to good. Corn is doing well; one or two good rains will give us a fair crop. Most of it is now "laid by." Potatoes, early at least, will not yield to exceed 50 per cent. Our hopes will be in the late planting and rain soon. Grass is very short; we shall be compelled to resort to wild slough grass for a supply. J. S. B.

IOWA, Mason City, Cerro Gordo Co.—Wheat bids fair for a big crop here. Corn is blooming. I have some of the large yellow Dent that is five feet high. Potatoes are doing well. Hay is heavy. If nothing happens to the crops we in Northern Iowa will have plenty of grain to handle this Fall. Fruits of all kinds are light. R. L. L.

KAN., Randolph, Riley Co.—The harvest of wheat, oats and rye will be two-thirds of an average crop. The prospects for corn and potatoes are for good average crops. No barley is sown here. The varieties of wheat are mostly Treadwell and Michigan White. No Spring wheat is sown. Common white oats. Fully seventy-five per cent. of the cultivated land is planted to corn: the rest is about equally divided between wheat, oats, and rye. Of potatoes but very few are planted—Early Rose and Peachblow. Considerable sorghum is being grown in some of the adjoining counties, but none here to speak of. Of fruit there are no peaches or apple orchards that are old enough to bear fruit in this locality, but in the more eastern counties there are good average crops of apples. A severe drought through April and May, with Chinch bugs, greatly injured the small grains. P. B. W.

KANSAS, Garnett, Anderson Co.—The wheat harvest in this vicinity is very good. The western part of our county has been too dry, and the crops are poor. Corn is looking very well. Oats are about an average crop. Potatoes are very good. The varieties of wheat generally raised here are Fultz, Walker and May. Fultz appears to have the preference for a good, hardy wheat, but the Walker is considered very nearly as good. I think the wheat will average about 18 bushels per acre; some fields will go 25 bushels per acre. R. W. G.

KY., Johnson Junction, Davis Co.—The wheat harvest is at least 10 days earlier than common. The varieties grown here are Lancaster, Amber and Fultz; average ten bushels per acre. More acres were sown than usual. There is considerable smut in the Fultz. Rye very good. Oats short. Barley, good. Potatoes, good but few in a hill—Early Rose the favorite. Snowflake, White Peachblow and Peerless are all grown. Potatoes are only grown for home consumption. From present appearance there is a fine prospect for a larger yield of corn than for years; a much larger acreage also than usual. Rye not much grown. Sugar cane, none. The prospects for fruit are slim. Apples are very scarce. Cherries, late are fine, and early scarce. Some peaches, but not an abundance. We have had a fine season for tobacco; a great deal was set out; has been raining every day for more than a week. I am afraid it will injure the wheat in shock. We have a splendid garden. My oats, mangels and peas are fine for the season. I. B. F.

KY., Greenville, Muhlenburgh Co.—The corn crop looks well, considering that we have had a long dry spell, but at this date there is rain to excess. Wheat is being thrashed, and is about half a yield; the rust injured the wheat and also the oat crop. The grass crop is splendid. Peaches and apples are rather scarce; berries of all kinds plentiful. All kinds of vegetables are doing well. The bugs are doing great damage to potatoes. Tobacco half a crop. D. B. S.

KY., Owensboro, Daviess Co.—Rain, rain, rain; meadows and oats down. Wheat in shock and badly stacked, in bad fix. Low land under water. Wheat is not panning out as well as expected. Corn is looking fine. Tobacco, good, bad and indifferent. J. W. S.

ME., Bangor, Penobscot Co.—The crops here will not be average ones in consequence of the drought. Lost Nation wheat, Dutton and Canada corn, and Early Rose potatoes are the varieties; no rye or sorghum. There is an average decrease of each of these. Apples are very fair; the Duchess, Northern Spy, Astrachan, Talman Sweet and Northern Sweet are the most useful varieties. J. P. P.

MASS., Shelburne Falls, Franklin Co.—Corn here yields about 40 bushels per acre; potatoes, 100; oats, 50; rye, 15; no wheat or sugar-cane is grown here. Apples will be a good average crop; Greenings and Baldwins are the most successful. F. A. A.

MICH., Lincoln, Berrien Co.—Wheat is a good, full crop, and is now mostly harvested. Corn—what there is planted—is looking well. On account of wet weather farmers hereabouts did not get in as much corn as they intended. Oats will be a good crop. We have a fine crop of hay, as we have had plenty of rain all through the season. Potatoes, in spite of the beetles, are looking fine. Apple trees blossomed freely, but from some cause the young apples disappeared and the crop will be light. Strawberries were a light crop. Raspberries and blackberries full crops. We are in the midst of raspberry picking which is two weeks ahead of the usual time. Indeed, all of our small fruits, this season, are rushing along to maturity much earlier than usual. What shall we do with the Rose-bug? It is a worse pest this season with us fruit growers than the potato-bug. First he went for our roses; then for the cherries and young grapes, and, lastly, he is at the raspberries in such numbers that sometimes in picking we get more bugs than berries; but I have noticed that for the last few days the pests are disappearing somewhat. M. W.

MINN., Austin, Mower Co.—Crop prospects are not the best—too much rain. Fife, Lost Nation and Walker are our principal varieties of wheat. Some pieces look well, but much of the low-land wheat looks very poor. Barley and oats look well, corn and potatoes are backward—acreage about the same as last year. Sorgbum is a new crop; it did well last year—acreage larger this year. The Duchess of Oldenburgh apple and Siberian crabs are as good as any kinds for this locality and there will be considerable of that kind of fruit. J. A. T.

MISS., Brookhaven, Lincoln Co.—Very little wheat, rye, or barley is ever planted here. Corn crop and cotton very fine thus far. There will be very little fruit. The crop of oats is not good; red oats preferred; black oats are generally ruined by rust. About the same acreage of corn and cotton as last year. Early and late Crawford peaches the best. H. F. J.

MO., Sedalia, Pettis Co.—The general prospects in this part of the country for bountiful crops, are the best for several years. The wheat and oat harvest is just finished. The yield of both per acre will be quite large. The prospects of the corn and potato crops are as fine as if not the finest that were ever seen here. From present appearances the hay harvest will be below the average. Apples, peaches and small fruits of all kinds in great abundance. Since cutting wheat the chinch bugs are doing considerable damage to corn, having destroyed acres in some places. E. R. L.

MONTANA, Tipton, Moniteau Co.—Wheat was harvested two weeks ago. It would have been a splendid crop, but Chinch bugs cut it down considerably in this section. Very few have thrashed it yet, most of the farmers having it stacked to pass through the sweat; but people believe it will fall short about half. Oats were looking fine a short time ago, but Chinch bugs are damaging this crop too. We shall commence next week to cut it. Rye and barley are not raised at all in my neighborhood. The varieties raised almost exclusively in this locality till a few years ago were the Mediterranean, some Early May, a sort called Norman wheat, and some Tappahannock. This year some of my neighbors raised Fultz, and I believe it is doing better than any other kind, being earlier. If the season is favorable this Fall I expect to sow Fultz and Mediterranean. People don't raise many potatoes here, the climate not being very favorable—just enough for home use. The RURAL'S Beauty of Hebron gave us not quite one peck last year; the season wasn't good—too dry. This year we expect to get from the seed saved three or four bushels. They are looking nice. The Ovoid mangel root looks fine, and we hope to make a success of it. Almost any kind of fruit does well in this locality, but grapes do best. The two last years the grape, however, rotted very badly; this season they are not doing so quite so heavily. We had some time ago a very nice prospect for all kinds of fruit, but since then the high winds and terrible storms have hurt them to some considerable extent. D. S.

NEB., Steele City, Jefferson Co.—Corn is the leading crop, and we never had a better prospect for it. White and yellow Dent. Spring wheat—the next in importance—promises much more than an average (say 15 bushels per acre), principally Cherrick. Considerable winter wheat was sown last Fall, and promised first-rate until March, when the dry weather and high winds caused it. But little rye is sown, and that is poor; barley and oats ditto. The bugs are about abundantly enough to take all of our potatoes. Considerable Amber sugar-cane is raised and does well. We have a splendid country for the farmer if he would adapt himself to its conditions. We are too far from market to raise small grain, but we can raise cattle, hogs and sheep, and we can raise corn to feed them. A. M. T.

NEB., Blair, Washington Co.—Winter wheat almost a failure, but little sown. Spring wheat now looks very well, excepting where winds blew off the soil during the drought in Spring—about the usual amount was sown. Corn about a medium stand—early planting on Fall plowing five feet high. Spring plowing, owing to dry weather in May, is much later. Early potatoes good; late ones, not over one-fourth of a crop. Oats good. Hay light. E. S.

NEB., Emrick, Madison Co.—The prospect for all kinds of crops hereabouts are as good as for years, oats excepted. W. G.

NEW JERSEY, Freehold, Monmouth Co.—The wheat crop is all harvested in good condition; quality good; yield a little above an average; area 10 per cent. above an average. Corn is looking well; acreage a little below an average on account of the inability to break the ground. Potatoes, about an average area, are looking well; the early crop was injured by the long drought. Rye not more than half a crop. Oats about half a crop. Barley none grown. Sorghum none grown. Apples about half a crop. The most successful apples are Orange Pippin, Baldwin, Smith's Cider, English Codlin, Pelican, Fallawater, Roman Stem, Orange. Peaches not much grown, will be about half a crop. Blackberries will do well. The Army worm has gone. We have had a nice shower and prospects are a little improved. The hay crop will be about one-third of a crop and of poor quality. J. H. D.

N. Y., Coventry, Chenango Co.—We have been having a severe drought in this section. The last week has brought plenty of rain. Wheat promises a good average. Corn and potatoes are looking well. Hay is very light. This is an important crop with us, as dairying is the main business. Apples promise a large crop. Cherries are injured by the black-knot badly; but few trees are living. Small fruits are not much cultivated. J. D. M.

N. C., Lynn, Polk Co.—The harvest of wheat has been very much cut short by rust and protracted dry weather. It may be set down here and in the upper part of South Carolina as less than half a crop. Spring-sown oats are almost an entire failure; Fall-sowing good. Bearded wheat has done better than the smooth. Wheat will not average five bushels to the acre. Fruit is very fine all along the south side of the mountain in the "Thermal Belt." L. R. M'C.

OHIO, Austinburg, Astabula Co.—There are more acres of wheat in this section than ever before, and the prospects of a large yield never were better—average yield other years 15 to 20 bushels. Fultz and varieties of red wheat are most grown, having proved more reliable than white. A small variety of early red corn is grown in this dairy section, because fine stalks are best eaten by cows and the cob is small, and kernels long. Peachblows and Early Rose are our favorite potatoes. Sorghum is but little grown and that only on the Lake Erie shore and the regions north of us. Fruit of all kinds are abundant. H. R.

O., Burgh Hill, Trumbull Co.—The prospects for crops in this section are very good. Wheat is mostly harvested, and is the best crop known here for years. The varieties most grown are Democrat, Clawson, Jennings, Fultz and Gold Medal, the last of which is being introduced. The average per acre is from 20 to 40 bushels. Corn, oats and potatoes bid fair to be fine crops. Sugar-cane is not raised in this locality. The prospect is good for an abundant crop of fruit. T. F. S.

PA., Tamarac, Crawford Co.—Wheat is above the average crop, 20 per cent. It is well filled, and good generally. Harvesting commenced the 28th of June, the weather being anything but favorable, as it rained every day during the week. It has cleared off now. The wind has changed to the north and it looks favorable for good weather. Considerable hay has been ruined during the wet spell. The drought in May shortened up the hay crop nearly one-half in this section. Clover meadows were the heaviest and nearly all secured in good condition before the wet season set in. Oats will be a fair crop, though injured considerably by dry weather. Corn is small for the time of the year, but most of it is making up for lost time and will be a fair crop. Potatoes are looking well, with plenty of beetles; wherever Paris-green has been used in time they look first-rate—will be a good crop without a doubt. Plenty of fruit of nearly all kinds. The Rose-bugs have injured the fruit considerably; they have been more abundant than ever before; taken all together, the farmer has no reason to complain the present season. C. S. A.

PA., Saltsburg, Indiana Co.—It has been raining more or less for five days, and there is no prospect of its stopping. This is very hard on grain that's in the shock. Most of the wheat is cut and is better than it has been for some years. Oats will be an average crop. Corn never looked better for this time of the year. Potatoes are not very promising. Hay will not be half a crop. Fruit of all kinds will be plentiful. My grapes are rotting very badly and have done so for the last three or four years. It has been a very wet June here. W. S.

PA., Winterburn, Clearfield Co.—We are in the midst of a very wet season, just the extreme of what the Spring has been. Grass, which was thought to be a failure, is now coming on and will be a tolerable crop. Of wheat there are sown many good pieces, and some very poor—a preponderance of the latter, I should say. Oats bid fair to be a good crop; potatoes also are looking well now. H. F. S.

TENN., Richland Station, Summer Co.—Wheat, White Amber principally, half a crop. Corn raised, white, good. Potatoes, Early Rose, good. Oats, Spring, one-third of a crop raised. Rye and barley, Fall varieties, good. Sorghum grown to a considerable extent. Apples, Early Harvest, Maiden's Blush, Horse, Baltimore, Lady's Finger, Poorhouse, Limber Twig, Winesap and Ben Davis—good. Peaches Hales's Early, Early and Late Crawford, Late Heath, one-third of a crop. W. P. M.

TEX., Lavernia, Wilson Co.—The harvest of oats and wheat will be over an average. Of barley and rye there is none. It is too early to tell regarding Sweet potatoes, and this is no Irish potato country, although they keep printing a pack of lies in regard to the success here of Irish potatoes and fruit. This is a fair corn country, and the bulk of the present crops is corn; next comes cotton, which is extra-well now, but cotton is never counted safe until gathered. Peaches, plums, figs and grapes are all the fruits that do well. F. J. S.

VA., Reed Island, Wythe Co.—Wheat, Lancaster and Fultz, 10 bushels per acre—injured by rust. Oats (no name), 15 or 20 bushels per acre—not matured yet. Corn, 25 or 30 bushels per acre—suffering from drought. Potatoes, Early Rose, a medium yield; "small potatoes." Sorghum is not cultivated here by the leading farmers. As these crops are not harvested it is impossible to estimate the exact yield—people differ so in their opinions. There is a good prospect for fruit—late apples. The last two Summers' drought has produced grapes abundantly. Berries are plentiful. Some peaches, and very few plums. Cherries abundant. A fine year for beans; a poor one for cabbage. M. L. S.

VA., Moore's Store, Shenandoah Co.—Wheat in this section was injured by drought—average yield 13 bushels per acre; quality fine, best kind grown, Key's Prolific. The corn crop is promising. Potatoes not half a crop—principal kind, Early Rose. Rye not well filled. Oats are generally short. Barley, very little raised here. Sorghum grown for home use here; most farmers raise about 33 gallons annually. The fruit crop will not be one-half as great as usual. The rose or cherry bug destroyed all bloom of grapes here. D. J. A.

WIS., Reedsburg, Sauk Co.—Most of the winter wheat in this section was winter killed or, more properly, killed late in the Spring by freezing and thawing and cold winds; consequently it will not be an average crop. Spring wheat looked fine until the last few days, but now the leaf shows signs of rust. There was a large acreage sown on account of the killing of the winter wheat. Oats are looking tip-top—will be a heavy crop. Barley is headed and presents a fine appearance—not much sown. Rye, both winter and spring, is exceedingly good; winter rye begins to turn and will soon be ready to harvest. Buckwheat is just sown; cannot state as to the certainty of a crop, but a large yield is expected. The hay crop will generally be light; as the clover roots were injured by the hard winter, yet new seeding and low-land meadows are more than an average crop. On account of the backward Spring and cool weather, corn is not as forward as usual for this season of the year, but it is now growing finely; a large amount has been planted. Potatoes never looked better; the beetle has not done any damage as yet. This section of the country is considered the hop center of Wisconsin; the yards, as a general thing, do not look very flourishing. The grub proves very destructive to the root. No lice as yet. Orchards are looking very good. The apple crop will be light on account of a severe hail storm which occurred about the time the trees were in bloom. Small fruits promise to be a full crop. On the whole the farmer's prospect, so far as crops are concerned, are very flattering—the best outlook for several years. Yet when the harvest is finished, how different it may be from what is anticipated. The farmers of this section are engaged in a mixed husbandry, and let the worst come, they generally hit on some product that is profitable every year. G. F.

WIS., Mondovi, Buffalo Co.—The harvest bids fair to be good. The varieties of wheat are Fife and Odessa; of oats the common white and a few Norways. Barley (the four-rowed) is looking splendid; of potatoes we raise the Early Rose and the Snowflake; of corn the Dent and Flint, neither is good—not very good—owing to a cold spell about planting time; the acreage of these is about the same as last year. Minnesota Early Amber cane looks well; acreage double that of last year; our apples are crabs, and a few others, such as the Dutchess of Oldenburgh; all are bearing well; small fruits are as good as usual R. F

WIS., Lodi, Columbia Co.—The weather has been uncommonly wet since the last of May, consequently all kinds of Spring grain have a large growth and are looking well. Winter wheat was almost a total failure about here. Spring wheat is badly rusted in many places. The Odessa, the Minnesota Red Chaff, Fife, Fultz and Clawson, are the chief sorts grown. Potatoes are doing well—Early Rose, Snowflake, White Peachblow. Of Early Amber sugar cane some was planted last year, but ten times as much this year. The prospect for fruits is first-rate. B. M. S

WIS., West De Pere, Brown Co.—Oats and wheat each occupy about one-third of our cultivated land hereabouts; the other third is divided between potatoes, barley, rye and buckwheat. Of wheat our principal sorts are Rio Grande, Fife and Russian Winter. The prospects are good for fine crops of all the above. Small fruits of nearly all kinds do well; but of apples the Duchess of Oldenburgh, the crabs and other hardy kinds do much the best. Sorghum is not raised here. Hay is rather light. M. A.

WIS., Milton, Rock Co.—As a general thing the crops are looking fine—rather above the average. The dry weather a month ago threatened to damage the small grains and grasses, but they have fully recovered except in a few cases. Corn is looking very well. Tobacco culture is quite an industry in this vicinity and considerably more has been put in this year than heretofore. D. E. S.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JULY 17, 1880.

THANKS WHERE THANKS ARE DUE.—The more we study the accounts of the harvest furnished to the RURAL by its host of friends throughout the country, the more strongly are we impressed with their excellence and value. So full and instructive are they that it would be difficult, aye, impossible, to discover any means by which so complete a knowledge could be gained of the agricultural conditions of all parts of this broad land, as can be obtained by a careful perusal of these multitudinous reports, especially if the reader studies a moderately good map of the country at the same time. We hereby thank all our friends who have enabled us to place before the public so valuable and trustworthy a statement of our agricultural condition.

A WASTED FERTILIZER.

IT is a common practice of farmers on the coast—and particularly in New England—to gather all the sea-weed and kelp that are thrown up by the surf or washed in by storm, for fertilizing purposes. This kind of manure they consider worth hauling, often to a considerable distance, although, as gathered, it is largely water and quite bulky. We have often wondered why so much care was taken to secure the sea-weed when a far better fertilizer—dead fish—could be obtained on the same terms with less labor. There are many places on our coast, particularly in the vicinity of fisheries, where dead fish abound, and in some localities in large quantities. All along the Massachusetts coast last fall, thousands of barrels of spoiled herring found their way back into the waters of the Atlantic, a portion of which might have been composted and made into manure upon contiguous farming land with profit. Since the menhaden fishery—for oil manufacture—has assumed such magnitude, the value of fish and fish refuse for manure is too well known to need further comment.

If the menhaden or "pogy" is good for fertilizing, old fishermen hold that herring is even better, and that good results can be obtained by the use of any fish. Coast farmers would do well to make use of this most valuable manure, and when collecting the sea-weed, to gather the fish at the same time. "Chum," or fish refuse, from the oil manufacturies not only costs money, but the expense of transportation must be borne as well. The present neglect to make use of such *free* material is only another example of the wastefulness of American agriculture.

VALUE OF COTTON SEED TO THE SOUTH.

IT is even in the memory of comparatively young men that cotton seed was considered a great nuisance to the Southern planter, and he was sorely puzzled at times how to get rid of it. Finally it occurred to a few that it might be used as a fertilizer. Slowly finding it beneficial to increase the growth of various crops, it was then thought by one here and there that it might be a nutritious food for animals, and especially swine. Being allowed to come to the heaps of seed and eat what they pleased of it, with more or less lint attached, it often proved their death. After this they cleaned the lint from the seed, boiled it, and, feeding a moderate quantity at a time, it was found highly nutritious and a perfectly safe food.

Next came decorticating the seed, grinding and pressing the oil from the meal, which made it still more valuable and economical than the whole seed for the food of all domestic animals. The oil was reserved for refining, and is now used for various other oils, such as the olive, castor, etc. Nor is this all, for the manufacturers of oleomargarine, taking the hint, are now turning out from it what they brand as "gilt-edge" butter! What may be produced from it hereafter may be hard to tell, but we should not be surprised if, in the course of time, the seed of cotton might approach the value of that of flax. When it comes to this, millions of dollars will be added to the sum of Southern exports.

Cotton-seed meal, even when fed to cows in considerable quantity, does not make their butter soft and oily, as linseed meal does, but rather adds to its firmness and richness. It also more rapidly increases a good quality of flesh in fattening beasts, as the albuminous compounds predominate largely in its composition.

PROBABLE DEPRESSION IN PRICES OF OUR CEREALS.

THE reports of the European harvest that have reached us by mail are considerably more favorable than those just received by cable. According to the latter the crops will be much shorter than reported some weeks ago, in northern Germany, Hungary, Gallicia, and in many districts in Russia which have been ravaged by locusts and other insect pests. In the British Isles, however, the outlook is still very bright for abundant crops of almost every sort, and this favorable prospect is shared by France, Spain and most of Italy. Although the trans-Atlantic harvest may, as a whole, not come up to the high expectations felt or published some time back, yet there is little or no doubt that it will be far better than last year's, and therefore that the demands for our cereals abroad will be considerably less than during the past season, unless at a material reduction of prices. Of course, there is just a possibility that severe storms or drought over a vast extent of country on either side of the Atlantic may, even yet, very greatly reduce the supply in Europe or the surplus here; but this possibility is far from a probability.

Looking back at the reports of the very fine prospects for all European crops that have, from time to time, been cabled across the Atlantic during the last few months, and comparing them with those received within the past week, one is apt to suspect that the glowing accounts of other days received some of their brightness from the desire of the Old World to lower the prices of the surplus cereals of the New, by embellishing the prospect of the abundant harvest that must soon generously relieve its own pressing need of foreign supplies. Be this as it may, enormous shipments of grain have lately been made to Europe to anticipate the harvest there and get all possible advantage from present rates. The arrival of these at their destination, together with the advent in market of the early harvest products of home growth, will doubtless still further depress prices, at least temporarily, and this depression is sure to influence figures here also. In view, therefore, of our splendid increase in crops here, and of the probable curtailment of the foreign demand for our surplus cereals, it is almost certain that prices will be unusually low, at any rate for the next few months.

For the probable depression in the prices of wheat, and perhaps of several other farm products, during this period at least, farmers will find some consolation in the thought that their labors have conferred a great blessing on the world at large. Cheapness of food means full stomachs for thousands who are accustomed often to be content with short rations; it means an increase in marriages and consequent happiness—or misery; it means discouragement among our foreign rivals in production, as it will bear more heavily on them than on us on account of the higher prices of their lands; it means consequently a probability of weaker competition on their part in the future; it means a heavier rush towards this land of plenty, of new mouths to be fed and new hands to do work and accumulate national wealth. Of all our enormous crops that which is wasted alone fails to add to the sum of the world's wealth and of man's happiness.

THE BLACK RAT OF OUR ANCESTORS.

As most of our readers are aware, the common brown or Norway rat (mus decumanus of the naturalists) now so generally distributed over the civilized world, is to be classed, as rats go, and comparatively speaking, among modern improvements. It was not until the middle of the last century that this kind of rat was known in Central and Western Europe, and it is said to have been brought to America as recently as the years immediately preceding the Declaration of Independence.

Previous to the advent of the Norway rat a smaller black species (mus rattus of Linnæus) was the common house-rat of Europe and America; but this weaker and more timid animal was everywhere driven out by the new-comer, and appears to have been pretty thoroughly extermined from most localities. The completeness of the destruction of the black rat has always excited the surprise and interest of naturalists. But it has recently come to light that, curiously enough, the black rat still lives and thrives in some special localities in Europe, where colonies or remnants of this species have escaped the general destruction. During the last year reports have been published to the effect that, though extremely rare in England and in most parts of Germany, the black rat is not uncommon to-day in certain elevated valleys in Thuringia and Voigtland, not only in isolated houses in the forests, but even in villages where the Norway rat is found in company with it, though apparently in smaller numbers.

In Italy and the Italian Islands, the black rat is still abundant. Indeed in some of the smaller islands the Norway rat is not found at all; but elsewhere the two species are found side by side. In that country the black rat is not only far from extinction, but appears to be rather more abundant than the larger species. For that matter, the persistence of the black rat in Italy is in harmony with the old habit of the species; for even in the days of its prosperity this kind of rat was known to prefer warm countries. So, too, the survival of the species in the thinly-settled forest districts of Germany is somewhat akin to what has been noticed in this country. In New England, 40 or 50 years ago, naturalists observed that the black rat could still be found occasionally in old, thinly-settled places. Prof. Claypole, of Antioch College, has recently stated that 40 years ago the black rat was the only rat in South-west Ohio. About thirty years ago the brown rat drove him out. Some years later the same thing occurred in Illinois. Prof. Claypole has been told by one of his students living in Minnesota, that neither rat is known in and about the town of St. Cloud, only one ever having been seen there, and that was killed on landing from a steamer.

In view of the German experience, above stated, it seems probable that communities of the black rat may have saved themselves even to the present day in some parts of this country, in similar retreats. As is well known, the black rat came to America with the earlier colonists, and was at one time extremely abundant. Indeed, it spread to such a degree that it was thought to be more abundant here than in the old world. It was subsequently driven away from the settlements, as it had been in Europe, on the arrival of the Norway rat.

BREVITIES.

WE heard an old farmer remark: "Well, I think that young beets are the best vegetable cultivated."

PROFESSOR F. H. STORER will soon begin a series of articles of much value entitled, "A Scientific View of Composts."

ONE of the RURAL artists is at present at work upon a bird's-eye view of the Rural Farm, which will be presented in our fair number to be issued about September 1st.

COL. CURTIS commences next week a series of articles under the title "Observations Among Rural Subscribers." He says "Every one mentioned is a RURAL subscriber, and they are all among the best of farmers."

DURING the month of June the arrivals of cattle at the Chicago market were the largest on record—121,358, against 111,542 in May. The largest run in any one week was 32,127 and the largest rush on any single day was 9,416, on June 25.

IN one of our wheat experiments, Fultz was sown in two ways, viz., six and twelve inches apart. The sheaves indicate that the yield of the former as compared to that of the latter will be as eight to five. There is no perceptible difference in the size of the heads.

ON July 1st the University of Michigan conferred the degree of Ph. D. on Prof. W. J. Beal, of the Agricultural College. He graduated at the University 21 years ago. This honor shows that a good feeling exists between the University and the Agricultural College.

THE acreage under wheat in British India is put down at 18,000,000, against about double that amount in the United States. Importations of grain from that quarter into England have begun to assume large proportions and bid fair to compensate ere long for the decrease of cereal imports from Russia.

THE cattle trade of Texas bids fair this year greatly to exceed that of any previous year. Already considerably upwards of 500,000 head have been driven north from that State, and the latest advices tell us that a great number of herds are now leaving, while a vast number of cattle are being fattened up for the Northern and Eastern markets.

WRITERS sometimes speak of the ease with which the Wistaria is changed from a vine to a standard tree or shrub. Our first experiment in this way was begun five years ago. The little tree is now four feet high, with a head three feet in diameter. It was a beautiful object during its late bloom, but the shoots still require constant watching and pinching back, or they at once adopt the vine habit.

ANTHRAX, black-leg, or inflammatory fever, has become widespread among the herds of cattle in Winnipeg, Canada. Nineteen out of every twenty animals attacked die of the plague. Next to pleuro-pneumonia this is the most fatal disease that has ever attacked cattle on this continent, being extremely infectious and usually fatal in less than thirty hours after the appearance of the first symptoms.

J. J. THOMAS says: "In riding through so prosperous a country as some of the best counties of New York, one may at once select the school-houses by the entirely neglected surroundings and the bleak walls, unshaded by a single tree. In one instance a district school-house was seen in a dilapidated condition, its original cost not amounting to $500, while two brick barns were in view, each evidently costing $5,000 or $6,000. This contrast indicated the relative estimation of the farmers of their horses and their children."

GLORIOUS showers. Corn is looking—well our good readers should see it. Never before at this date have we seen heavier or taller stalks, broader or greener leaves. It is the very model of perfect health and luxuriance. Blount's corn, of which we have about an acre—or perhaps a little less—gained an early start and, though checked a little by the drought, is in no way injured. In fact, we hope the check thus received may end in a better and earlier development of ears at the expense of an inch or so of hight, which would never be missed!

THE average yield of cotton per acre in 1878-9 was 182 pounds, while that of the previous year—'77-8 was 179 pounds. Last season's yield cannot be accurately known until the close of the cotton year—September 1, '80, but from present indications it can scarcely be under 200 pounds per acre. The present crop, it is expected, will be an advance on the last one as much in yield as in acreage, and is now from 10 days to two weeks ahead of the usual condition at this date, except in a narrow strip, running north and south through Alabama, and another small one in Louisiana and Mississippi.

The following "crop" report is "peculiar:"

CAMBRIDGE, Mass.—No wheat, corn, oats, rye, or barley are grown here, and not many potatoes for the market. We occupy ourselves mostly in eating the above-mentioned products, though probably a good many wild oats are sown in the college. The principal varieties of potatoes are the mealy, the watery and the Spring. The achers are most numerous in cucumber season, though the corns cover many feet throughout the year. Canes flourish in the college-yard (about five acres), but there is not much sugar in them. Prospecting for fruit is dangerous, as farmers keep dogs. Strawberries meet with great success, but many of them fall victims to consumption.

B. P. M.

SEVERAL extremely severe rain storms have done much injury to farm crops and belongings in different parts of the country during the past week. Central Iowa, northwestern Illinois, central Kentucky, and parts of Georgia have suffered severely. All over the country the rainfall seems to have been heavy, and while it has in many places hurt cut hay and grain, it has, on the whole, greatly benefited corn and other growing crops, and will, doubtless, add many millions to the aggregate income of American agriculture this year. It is a difficult matter not only to suit people of different occupations with the same sort of weather: but also to suit those of like occupation with the same sort of weather for different crops.

THE SPARROW PEST.—We confess we do not feel very friendly towards the English sparrow. We may not know how much good he does; but we certainly do know that he does a great deal of harm. During the past season flocks of sparrows have frequented our wheat-fields, and the quantity of grain broken down by them has been considerable. They fly upon the head of grain, which at once falls to the ground under their weight, breaking the straw as it falls. As soon as they have eaten the kernels of one head another is broken down in the same way, and this is continued until they have eaten their fill. Their worst depredations were confined to the ripening grain at that stage when it was between milk and dough. As soon as the kernel hardened they quit the grain fields for other pastures.

AGRICULTURAL statistics show that in the last 15 years the production of wheat and barley here has doubled; that of corn, cotton and tobacco more than doubled; potatoes nearly doubled; hay increased more than one-third and oats about 140,000,000 bushels. The vast increase in cereals is mainly due to the rapid development of the Western and Northwestern States. During the present generation the corn center has been transferred from the South to the West, and the wheat center from the Middle States to the Far West. From 1870 to 1878 the production of tobacco increased 100,000,000 pounds, mainly in the South; while Texas and Arkansas have been the chief contributors to the increase of nearly two and a quarter million pounds of cotton in the same time. In the former 157 000,000 were raised in 1870, and 500,000,000 in 1878; in the latter, 111,000,000 pounds in '70, and 318,000,000 in '78.

AN act of the last Congress will be very likely to cause a large increase in the growth of tobacco through the country in small patches. Hitherto all dealers in the weed, however small their aggregate yearly transactions, have had to pay to the National revenue a tax of $25. Hundreds of country-store keepers were therefore prevented from buying or trading for small parcels of tobacco from the neighboring farmers, because their yearly dealings in the article would be too trifling to justify them in taking out a license, for which they must pay the above sum; consequently farmers, thus lacking a convenient market, were discouraged from planting the weed. By the new act, the license fee of the small dealer is reduced from $25 to $5 per annum, and this reduction will, doubtless, induce thousands of store-keepers to deal in a small way in the article, which is pretty sure to lead to a great increase in the cultivation of tobacco in small quantities.

LATEST CROP REPORTS.

(Continued from page 456.)

COLO., Golden, Jefferson Co.—The crops in this county are very poor. The Winter and Spring were too dry for getting in crops or for starting the seed after it was in the ground. Spring wheat is our principal crop and averages about 25 bushels per acre in ordinary years; but this year it will not average 10. The acreage compared with other years is about 75 per cent., but 20 per cent. of that is a total loss by reason of the drought. We depend on irrigation to make the crop after it is up; but when we have to irrigate it up, it's a losing business. The most popular variety of wheat raised here is called "White Siberian." I never heard of it before I came here; but it is an excellent wheat and about all the kind our millers will grind. It is a hard white sort and makes about 42 pounds of flour to the bushel; wheat is all dampened before grinding here. We raise some barley and oats, but the acreage is small this year. Corn is a failure this season; we raise the small varieties. Potatoes are grown extensively in the mountains and in the valleys in some parts of the State, but not in this county. I understand the prospect is favorable for the crop. Some sorghum was raised last year of the Early Amber variety, and succeeded remarkably well, more was planted this year, but the drought "got away" with it. Fruit-growing is in its infancy, but small fruits succeed very well; Doolittle's Improved raspberry is loaded with fruit. Gooseberries do well; and so do strawberries. Grapes do well, but are injured by drought this year.

T. W.

GA., Du Pont, Clinch Co.—No wheat is grown in this county. Oats are not an average crop. Very little barley or rye. Corn 15 bushels per acre. Cotton promises to be above an average yield. Rice fine. Very few kinds of fruit are grown here. Peaches would do well if they were introduced. Scuppernong grapes do finely. Plums, Pears, apricots and oranges, grow well; apples will not do. Strawberries ripen in March. Potatoes and all roots do well.

R. M.

IND., Pleasant Lake, Steuben Co.—Wheat is being harvested now; I think we shall have an average crop, although some kinds have been blighted. We have had very wet weather all the Spring and Summer. There is not so large an acreage of corn and oats as usual, and the continued wet has made the growth uneven. Hay is good; I think it will average one and a half ton to the acre. The wet weather has injured all the potatoes—drowned them out. Of Early Amber cane there has been a good deal planted.

H. B. D.

ILLINOIS, Baileyville, Ogle Co.—The weather has been very wet and unfavorable for haying and harvesting since the 24th ult. We had a heavy rain on 4th inst—but it is fair now. The harvest is progressing rapidly. Some commenced cutting rye and winter wheat before the Fourth. Rye is good; Winter wheat variable—some good and some thin—will average a light yield. Spring wheat is somewhat injured by rust and will not be a large crop. Oats are heavy. Barley, fair if it can be harvested without its spoiling. Corn and potatoes were never better at this time of year. Grass has improved greatly of late; but a considerable amount of hay has been spoiled by the wet weather.

W. B. D.

ILL., Milo, Bureau Co.—Wheat is almost a total failure in this section; but little was sown this year as it is not a sure crop. The prospect for corn is good; this is the principal crop in this locality. Potatoes—Peachblow, Early and Late Rose—prospect good. Oats—mostly white sorts—prospect good. Rye good, but not very much is raised in this section. No barley is grown around here. Sorghum is not cultivated to any great extent of late years. Grain has not been harvested, so I cannot state now large the yield will be. The fruit crop is very abundant this year. Berries of all kinds, except strawberries, are very plentiful. Some peaches are raised, but this fruit is liable to be winter-killed. Grapes are abundant. Apples—Ben Davis, Jonathan, Willow Twig, Snow and Malden's Blush—a large crop.

J. G.

IOWA, Unionville, Appanoos Co.—The changeable Winter and rough Spring entirely killed Fall wheat. Spring wheat is somewhat roasted and will make only half a crop. Oats will be a full crop. Grass very light, not half a crop. Corn promises to be very good; it is clean and the ground well pulverized; we are having showers, too, to keep it a-growing. Small fruits of all kinds are plentiful. Apples are enough to make a good crop of fair size. Potatoes and all hoed crops promise well. We began using new potatoes on June 17th. They are of good size and good in quality. Pastures are short, but the rains we are having now will revive them. Hogs are healthier at present than they have been for several years.

F. K.

KANSAS, Crooked Creek Valley, Clarke Co.—This county is new, but comparatively few settlers having been here previous to 1879. Many of these came from towns and were unused to farming, and especially to prairie farming. As a natural result many have left disgusted; others have gone on a long visit to their "wives' folks," while those who remain are trying to see what this once-called "American Desert" will produce. But little wheat was sown last fall and that little is a total failure. No oats, and no Indian corn worth notice. The few farmers here depend on the Egyptian Rice corn, sugar cane and millet for their chief productions in grain. Up to May 19 it was extremely dry; but plentiful rains, commencing then gave a chance for breaking, plowing and planting. Bugs took the early gardens; not the potato bug alone but a long, black bug very destructive and greedy of every green thing. At present the prospect is that the Rice corn, sugar cane and millet will produce good crops—we hope enough for home consumption. The rains of last week have brought up the second planting of vines and beans which though flourishing nicely to-day may disappear before to-morrow's bug army. The valley is covered with a peculiarly nutritious grass, so that horses and cattle are fat; while the Buffalo grass is rapidly growing green at last, giving good promise of splendid Winter feed for the flocks and herds which find pasturage here. There is no doubt but the hay crop will be sufficient for the wants of the horses and cattle, and if the railroads were nearer, a good deal might be shipped. There are no fruit trees bearing, and but few started, and only here and there fruit vines of any kind.

A. M. N.

KAN., Harlan, Smith Co.—A very unusal drought prevailed in the early part of the season. Since June 12th we have had plenty of rain. Small grains are more nearly a failure than ever before. Corn looks exceedingly fine, and we look for a large crop. Potatoes look well where the bugs are kept off. This is a fine country, and is rapidly settling up.

F. E. H.

KY., Milton, Trimble Co.—Wheat is now sprouting in the shock owing to the frequent rains and warm weather. It is still raining and warm. Not more than five per cent. is thrashed, averaging 12 1-5 bushels per acre. Corn, potatoes and tobacco are "booming." Wheat is worth 87@90c.

S. E. H.

NEB., Rising City, Butler Co.—Wheat will not be more than half a crop at best. We did not have any rain to wet the ground until May 30, and consequently all grain suffered. Corn is looking well; the ground is generally clean. Oats poor; barley ditto; rye very light. Potatoes are backward and did not come well. Our varieties of wheat are: Odessa, Grass Wheat, Blue Imperial, Polish, Peru and White Russian. Odessa is looking much the best this season. The comparative acreage, putting wheat at 100, is: corn, 80; oats, 20; barley, five; rye, five; potatoes, two. Sorghum is not raised to any extent; there is no way of extracting the sirup. It does well when planted. We have but very little fruit as yet; 'hoppers destroyed the trees in '74 and '75, and we are just getting started in fruit trees again.

F. A. B.

NEB., Orleans, Harlan Co.—The rainy season began extremely late. East of the 99th meridian, in Southern Nebraska, crops are good. Between the 99th and 100th wheat is poor; but corn is coming on finely. West of the 100th cattle, sheep and grass are the only crops to depend on this year. The immigration wave rolled in too far and is slightly receding. Abundant rains all over the State at pr esent.

R. H. C.

NEW MEXICO, Cimarron, Colfax Co.—The harvest for New Mexico will not be abundant, as the whole of the year so far has been marked by a drought. No crops are raised except along the streams where water can be taken out in ditches for irrigating purposes; some of the smaller streams have in consequence of the light fall of snow in the mountains, and the general drought, had such a small amount of water that farmers have not been able to irrigate their crops sufficiently, though if the "rainy season" should set in soon, a fair crop might yet be reaped. About the only grains raised worthy of notice are Spring wheat, oats and corn. A small amount of potatoes too are raised in the mountains and valleys of high altitude. Barley seems to do well also in mountains and valleys. Rye and many others of the ordinary Eastern crops are not cultivated here. The acreage under either of these crops is very small. There are in all of the counties of the Territory a few streams with narrow valleys; these little valleys are cultivated about as high as water can be turned into ditches. This county of Colfax is about 8,000 square miles—as large as some States—and I think I can safely say there is not over 2,000 acres in all under tillage. The amount usually under cultivation is about the same as the past few years, wheat being the staple crop. We buy almost all our breadstuffs, horse feed, etc., from the East, mostly from Kansas, some from Missouri, Illinois and other States There are not 10 acres of sorghum in the whole Territory, I think. there might be a few acres along the Rio Grande River, but I think not. There will be some fruit this year, and this must be very small since there are very few orchards. In this county there are scarcely 500 fruit trees, and they are, with few exceptions, very small. It is mostly so, too, in adjoining counties. There is, in this county, a small orchard owned by a German who has a hundred or so of German prunes that have done well for young trees. The drawbacks to fruit raising are, in the mountain districts, a few severe winds that destroy more delicate fruit buds in Spring, and also, occasionally during Summer there are late frosts that kill blossoms. In the counties more to the south, and particularly along the Rio Grande, there are some small orchards and some good-sized vineyards. There no Winter is severe enough to injure fruit; only occasionally a Spring frost does harm. There some vineyards are large enough to manufacture large quantities of mostly wine, which is sold throughout the Territory at from $5 to $8 a barrel. The grape approximates a native variety, though it is claimed to have been brought here in an early day by missionaries of the Catholic Church from Spain or some European country. It is a small but very delicious grape, a little larger than the Delaware, and we think better flavored. It is not grown on a trellis but allowed to grow on a stem, cut back and covered up in Winter, as it is very tender. The varieties of fruit are almost altogether brought from Eastern nurseries, and, as a rule, are very poorly selected for the climate. Some also cultivate very ignorantly in many respects, one especial difficulty being the process of proper irrigation, which seems to be little understood. There is quite a quantity of native fruit trees, such as apples and apricots, the latter being a little small, rancid early apricot, and the former being a little oblong, white sweet apple, almost worthless, the peculiarity being that the seed of this variety always germinates the same worthless variety.

M. W. M.

N. Y., North Hector, Schuyler Co.—We are having a severe drought; everything is drying up. The hay crop is very light, and so will be oats and barley. Corn is rolling up very badly. Potatoes are very small and badly injured by the bugs. Grapes are looking very good; peaches, rather scarce. Pears are looking fine, and so are apples, with a prospect of a full crop.

A. M.

N. C., Greensboro, Guilford Co.—Wheat on well tilled and manured ground is good; but there are many complaints about rust, and I hear it is not thrashing out as well as expected when grown on old fields that have been cropped for years without rest or manure. Fall oats and barley are very good on good ground. Spring oats and hay are rather light on account of dry weather. Corn is rather late, but looks well. Potatoes, both Sweet and Irish, look well, especially the former; so does cotton. Of these three there is an unusual area planted. Apples, pears and peaches are plentiful here, but in some sections there are hardly any. The Ennobled oats are just ripe—they have done well. I shall have a fine lot to sow next Spring. I sowed them too thick; but they stand three feet five inches and are well headed, though they were sown a month too late for this climate. I expect a great yield from them next year. The Telephone pea is ripe; it, too, did well. The mangels are splendid—one measures 12 inches around. The willows have grown finely.

O. K.

NOVA SCOTIA, Cornwallis.—Our season is much later than that of the United States, and it is too soon to judge closely of some of our crops. Grain at the present time is looking well, and with favorable weather will be a good crop. Wheat, oats and buckwheat are the principal grains sown. Lost Nation is the chief wheat grown here. Our winter Wheat is a white variety. What was sown is looking well. Potatoes are our staple crop. In the township there is a large acreage planted, but it is too soon to tell how they will turn out, as they are only now being hoed the first time. I expect to have several bushels of the Beauty of Hebron from the potato the RURAL sent me last year. They are doing finely. Early Rose, Breezee's Prolific and Chili Reds are the principal kinds grown. I do not know of any sorghum being tried here as yet. Our hay crop will be below an average on account of the dry weather. Our fruit prospects are good. Apples are our principal fruit, of which the following are most successful: Fall—Bough, Gravenstein; Winter—Baldwin, R. I. Greening, Roxbury Russet, Nonpareil, Northern Spy, King of Tompkins County.

J. E. E.

NOVA SCOTIA, Belmont St., Colchester Co.—In this northern country we can hardly tell yet what the harvest will be. Wheat looks well, the kinds sown are Lost Nation, Red Fern, Golden Drop, Scotch and White Russian. Potatoes are doing well this dry weather. Hay will be below the average crop, unless we have wet weather this week. Oats, barley and buckwheat are fair. Roots of all kinds look well. Onions grow well here We have only raised small quantities until the last two years; we have grown them to weigh 18 ounces, but they are injured by a small maggot or worm that eats the top off close to the bulb. The oats and mangels of the RURAL'S Seed Distribution are doing splendidly; the melons came up all right but the ants spoiled them.

J. C. R.

OHIO, Mount Pleasant, Jefferson Co.—Harvest commenced in this section more than two weeks ago, probably the earliest known for years. The wheat is all in shock, well filled, and in excellent condition. The acreage exceeds that of last year by at least one-third; but with no better yield. A great many farmers claim from 25 to 30 bushels per acre. Price of old wheat $1.05, with a prospect of some decrease when the new crop goes into market. The hay and clover crops are short, but good in quality. The scarcity is owing to an early drought when stooling, and the price of hay will be as high as last year—$18 to $20—if not more. The corn crop in general looks well, and in fine growing condition, but needs work, which it lacks owing to the early harvest. Oats are short, but are filling well, and bid fair to make a liberal yield if the grasshoppers do not injure them, as they are growing very thick. The season since the opening of Spring, with the exception of a short drought which came quite early, has been a growing one.

G. E. S.

UTAH, Glenwood, Sevier Co.—Crops are below the average in thrift; they have a large acreage. Late frosts damaged almost all kinds of crops. Grasshoppers are doing some injury in this valley and adjoining ones. Old grain is scarce, and sells at 90 cents to $1 25. Beef and mutton stock has not come into market to any extent, though animals seem to have recovered from the hard winter. A great many lambs—at least one-half, died from a cold, snowy, late Spring. Some sheep-raisers lost as many as 500 head each during the Winter. Weather now very hot and dry; no rains. Eggs, 10 cents; good butter, 25 cents, scarce; oleomargarine or swineogreaserine has taken its place in most families.

W. M. C.

WEST VA., Lewisburg, Greenbrier Co.—Wheat, acreage about a third larger than usual—about 40 acres to the square mile; kinds grown—Lancaster, Fultz, Philadelphia Amber and Wick's. Although the acreage is larger, the crop will be but an average. The Lancaster has proven to be the surest and best. The Amber is good, but there has been but little of it grown yet. The Fultz has been giving the largest yield, but not this year. The Wick's is uncertain. Corn, acreage about the same as that of wheat. Oats about the same. Rye, but little grown. Barley, none grown. Potatoes, none grown except for home use. Sorghum, but little grown. The prospects for fruit are fair; very little grown besides apples. All kinds do well as this is a fruit country.

S. O.

WYOMING TER., Lander, Sweetwater Co.—This is not as much of a farming as it is of a stock country; there are not over 1,000 acres under cultivation in the valley. The past was a very cold Spring. The potato crop will be short on account of the seed rotting in the ground. Oats do not look as well as last year at this time. The acreage under wheat is about the same as last year—not large. Wheat has not done very well so far. Corn is not cultivated except in gardens for roasting ears. No barley is grown here. Unless we have an uncommonly favorable Fall some of the crops of grain will get frozen and harvest will extend into October. These crops, therefore, will not be as large as last year; grain ranges from 25 to 80 bushels per acre.

J. J. T.

For Women.

CONDUCTED BY MISS RAY CLARK.

YES OR NO.

You ask to-night my daughter's hand,
As you'd request a toy—
Do you know the weight of your demand
On a mother's heart, my boy?
You say you love her wildly; well,
Will it last to the end of time,
Or will the ring of the wedding bell
Resound its dying chime!

The heart you crave is a holy thing,
So tender, trusting, true;
Can you to her devotion bring
As warm as hers to you?
Will you love her through the changing years
As tenderly as now,
When ills shall pale, or sorrow's tears
Becloud her sunny brow?

When age shall bow her graceful form,
And bleach her jetty hair,
Will you protect her through each storm
And shelter her from care?
When time shall dim her sparkling eye,
And winter furrows show,
Will your love be the last to die?
If not, I answer, No.

Remember that her future life
Would every day be yours;
A loving woman when a wife,
To one whom she adores,
Has no existence of her own
Apart from him she loves;
She lives henceforth for him alone,
And in his orbit moves.

She molds her wishes to his will,
Her ways to his desires;
He leads her by love's willing web
Through life's refining fires;
She walks with him through thorny fields
And o'er life's rugged road,
He is her idol and ideal,
Her guide and household god.

So if your love will live and burn
And bless her future years,
If you will give her in return
The trust her life endears;
If you will guide her destiny,
And shield her from distress,
Will always live adoring her,
Why then, I answer, Yes.

A MOSS PICTURE FRAME.

Most of the directions given for home decoration in the magazines of the present day, profess to have the advantage of cheapness, but I confess I do not find them so.

I therefore give the following directions for a frame that I think suitable for a chromo or something bright.

We have all noticed in our walks through the woods, in the Fall of the year or Winter months, how many shades of green the different patches of moss display. Some a light velvety corn color, others an apple-green, and then again nearer the water's edge we find the rich green patches still more like velvet.

The time to collect it is when the earth is dry; select the most velvet-like varieties you can find, and pull the fibers apart, separating each shade into bundles, just as you would sort colored silks before working a pattern.

Take a flat sheet of thick card-board, and cut an oval piece from the center, leaving a hole the exact size of the picture. Next turn the sheet on the wrong side, lay a glass over the hole and draw a line around it with a pencil, then cut four strips of card-board the length of these lines, and after piercing them with an awl fasten firmly with cords to the frame. Place the glass in the square formed by these strips, and on that lay your picture; if this proves to be a perfect fit, cut a piece of card-board to cover the picture, place it over the back of it, and fix it securely in place by means of small tacks driven into the strips that form the case at the back of the picture.

After seeing that each part of your frame is an exact fit, take two short hair-pins, and pierce the board on the under side some distance from the top with the hair-pins, one on either side of the picture. The heads of the hair-pins should be left sufficiently above the surface to pass a cord through, and the points that pierce the upper side, should be pressed flatly to the face of the board.

The different parts of the frame being fitted and ready for use, you can put them all by, but the large square piece. After looking carefully to be certain that you can begin on the right side, which is indicated by the points of the hair-pins, sew a regular row of the darkest moss around the oval center of your frame; the second row should be the next darkest shade, and so on until the lightest shade comes next the edge that rests against the wall.

In sewing the moss on, care should be taken to let the velvety portion of each row cover the stems of the one above.

When this is finished, fit all the parts of your frame together, and hang where it will catch the evening light. You will have a cheap, and I think, a pretty frame.

EULALIE.

To select the young as teachers for the young is one of the experiments of modern times that has proved eminently successful. The fresh interest and enthusiasm of the instructor infuses itself into the pupils, who feel a reliance upon the sympathy and appreciation of a teacher who still vividly remembers the difficulties of her own schooldays. Frequently the elder teachers, although probably better furnished with patience and experience, have become the slaves of routine, bowed beneath the grievous burden of a weariness of their work.

MRS. HAYES discourages wearing low-neck dresses almost as much as drinking wine.

DESCRIPTION OF CUTS.

No. 231.—BASKET FOR EGGS.

A round card-board box about 22 inches in circumference is used for the foundation; it is lined with moss-green cashmere. The cover for the outside is composed of a band of looped knitting, worked with shaded moss and bright green wool, as follows: Cast on twenty-four stitches, knit the first row.

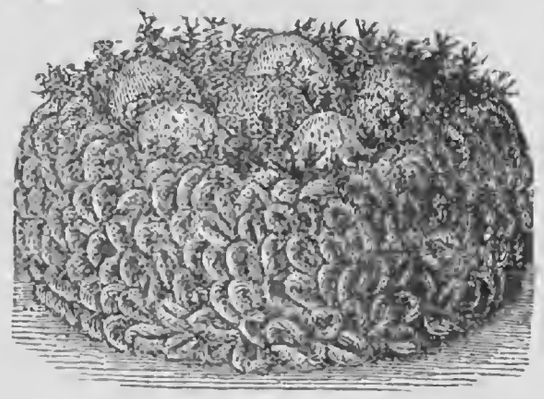

FIG. 231.

2nd Row: Insert the right-hand pin into the first loop of next row, turn the wool three times over the pin and round the forefinger, draw all three loops through in the ordinary way, knit one. Repeat to the end of the row.

3rd Row: Knit plain, taking the three loops of last row as one stitch; the second and third rows are repeated until you have worked 22 inches, when cast off, join round, sew neatly to the outside of the box. The inside of the box must be half filled with wadding before putting in the lining.

For the moss which fills the inside take single Berlin wool of the same shades, cast on twenty stitches, and knit in strips of plain knitting; steam the strips over boiling water, then dry thoroughly, cut off the stitches along one side, and unravel the work to within about three stitches of the other side; sew this mossy fringe in bunches along the sides and at the bottom.

This will form a useful addition to the breakfast-table, as it will keep eggs warm for some time.

No. 234.—PINCUSHION.

Cut an octagon of stout card-board, and cover it with dark olive velvet. Take a round card-board box (a paper-collar box will answer very well), cover it with olive satin, ornamented with a band of cross-stitch embroidery, worked with crimson silk; sew it firmly to the octagon, make a cushion exactly to fit the box, cover it with velvet, cover a small pill-box with velvet and sew it to the centre of the cushion. This serves as a thimble-case. A gold cord is placed at the edge of the cushion and also round the thimble-case.

No. 232.—DRESS FOR LITTLE GIRL FROM FOUR TO FIVE YEARS OF AGE.

The dress is of pink batiste, trimmed with loops of ribbon and lace: cavalier collar and cuffs of embroidered muslin. There are many kinds of material suitable for this tasty, little suit; it will not necessarily require the use of the batiste.

No. 235.—Bonnet of fancy straw, trimmed with cream lace, garnet satin ribbon, deep crimson and tea-roses, and gold dagger.

FIG. 232.

No. 233.—Hat for Little Girl.—The hat is of fawn-colored chip, trimmed with satin ribbon. The milliner's windows reveal this style of hat in different colors and varied trimmings. It is particularly adapted to the young miss, being becoming to almost all faces.

FASHION NOTES.

FOR the comfort of those who regret not to be able to wear in Summer, bodices of a material different from the skirt may rest content; there are yet several combinations which allow of continuing a fashion above all others economical. With black or dark-colored skirts, they may wear a bodice of black figured silk or wool. With skirts of lighter shades, in self-colors, they can put on a bodice of foulard, with a printed or brocaded pattern—especially if they use for the trimmings of the skirt a little of the same material, either as bias-bands or as pleats dividing a flounce at regular distances.

Among the silk tissues suitable to Summer toilets, surah, in all colors, is employed in preference to all others—black surah for elegant underskirts; handsomer and thicker twilled surah for mantles; similar surah, in black or colors, for costumes, in combination with light woolen or with figured materials. A few descriptions of modern toilets, however, will give a better idea of such combinations than any general remarks.

A pretty walking toilet is of heliotrope-colored cashmere. The round skirt is pleated lengthwise, and upon the left side the pleats are commenced from the waist. The tunic, very much looped up upon that side, comes down to the edge of the skirt; the trimming is composed of a scarf of surah to match. Bodice with a basque, forming a peak behind and in front; a scarf of surah very finely pleated finishes the bodice, and appears to join it on to the skirt. The front of the bodice is trimmed with a drapery of surah, which forms a full chemisette pleated at the waist.

Another toilet is of woolen crape of a rosy gray, called "ashes of roses." The skirt, of rose-colored surah, is pleated all the way down in very fine pleats; the tablier, very much draped, is looped up very high at the sides, so as to leave almost all the skirt visible; the bodice with deep basques forms a coat at the back; the front is put on with

FIG. 233.

a waistband; a basque of puffed surah is applied on to the basque at the back; the plain sleeves have at the top small puffings of surah; chemisette of puffed point d'esprit tulle.

Again, a pretty summer toilet for the country is of satin foulard with shaded dots. The skirt is trimmed round the bottom with a deep and very fine fluting, headed with a full-gathered puffing—this trimming is repeated twice: jacket-bodice with a scarf put on about the hips, upon the basque itself, and finished in a large bow over the basque at the back; very tight sleeves.

Lastly, a visiting-toilet is of lichen-colored bengaline. The lower edge of the skirt is trimmed with satin to match; a deep net-work of beads to match ornaments the outline of the skirt; this net-work is headed with a drapery of bengaline, which is joined on to the bodice, made jacket fashion, and with a waistband in front; the neck is trimmed round with a bead fringe, forming a necklace.

One of the prettiest fabrics of the season is called "nun's veiling." It is a very light semi-transparent material, which combines very effectively with brocaded silk or satin.

Thus a very elegant costume is composed of heliotrope-colored nun's veiling and satin of the same color. The front of the skirt is shirred; on each side is a robing formed of four pleats of satin. The bodice, in the shape of a deep jacket, is made of satin with passementerie brandeborgs of the same color; round the neck, a double ruche of point d'esprit tulle coming down into a quilled ruffle down the front of the bodice. Round the bottom of the front part of the skirt there are two narrow flounces of ruche satin.

CARE OF CHILDREN.—The mother of several children says: "I devoted myself to the charge of my nursery; I attended in person to the physical and mental needs of my young children. The work was laborious, but it has repaid me. They are healthy, brave, honest and frank; they are cursed with none of the small vices contracted by intimate intercourse with persons of inferior intelligence; and they are self-sustaining at an early period. Neither pert nor precocious, they ripen early to judgment and common-sense, and I believe that the careful tillage of my own little field has produced a harvest worth the labor."

Mrs. Livermore contends that if mothers would train their girls as housekeepers, at the youthful period when girls would be delighted to learn, they would then take to housekeeping as naturally as ducks take to water. She does not recommend, however, that instruction should be confined mainly to domestic duties, or that marriage should be considered the principal aim of the fair sex but advocates a system of broad and liberal tuition which will fit women for any of the probable contingencies of life, render them self-dependent, and fully develop their varied faculties.

AUTHORS are spoken of as dwelling in attics because so few of them are able to live on their first story.

Literary Miscellany.

RESULT FROM MISTAKE.

CHAPTER III.

(Continued from page 450.)

"But I can't help feeling just a little jealous of her when I think about it," added Kate, naively; "and so, Frank, I want you to make me a promise. You will not refuse, though I know you will call me silly. Do promise!"

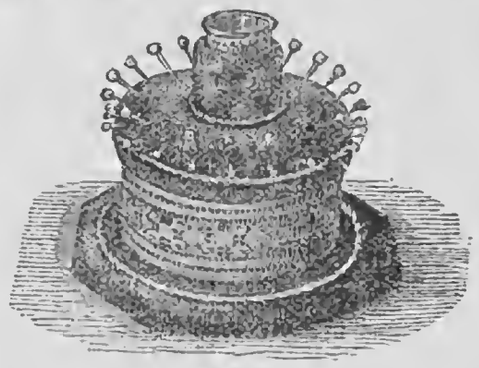

FIG. 234.

"What is it, Kate?"

"You remember, of course, that we have promised to attend Mrs. Abbot's party on Thursday next. Your cousin Kate will be there. Now, I want you to promise me that you will not dance with her—not even once. I feel that I could not bear to see her in your arms!"

For a moment Frank hesitated. But there was no resisting the pleading of his companion.

"It is very arbitrary of you, little one, to wish to shut me out from the society of my charming cousin, and I am not sure that I ought to comply with your request. Still, as you wish it so much, let it be so. I promise."

Poor Kate was delighted with her success. How far she was from suspecting the real motive which had swayed her lover! But the time was coming when she would be rudely awakened from her blissful dream, and when all that had been hidden from her knowledge, would come upon her with relentless force!

CHAPTER IV.

Mrs. Abbott's parties were invariably brilliant and successful, so as a natural consequence they caused no ordinary amount of pleasurable excitement. With the solitary exception of Frank Drayton, all the invited guests were looking forward with the keenest delight to the evening's enjoyment. He, however, was by no means in the mood for taking part in such festivities. During the week just elapsed he had found the task of playing the lover far more irksome than he had imagined it possible for it to be. Kate's perfect faith in him touched him deeply; but at the same time, her many innocent manifestations of affection palled upon him. How forcibly he felt the wisdom of the old Athenian sage, who, when asked what was the most ungracious thing in the world, replied—*unwelcome caresses.*

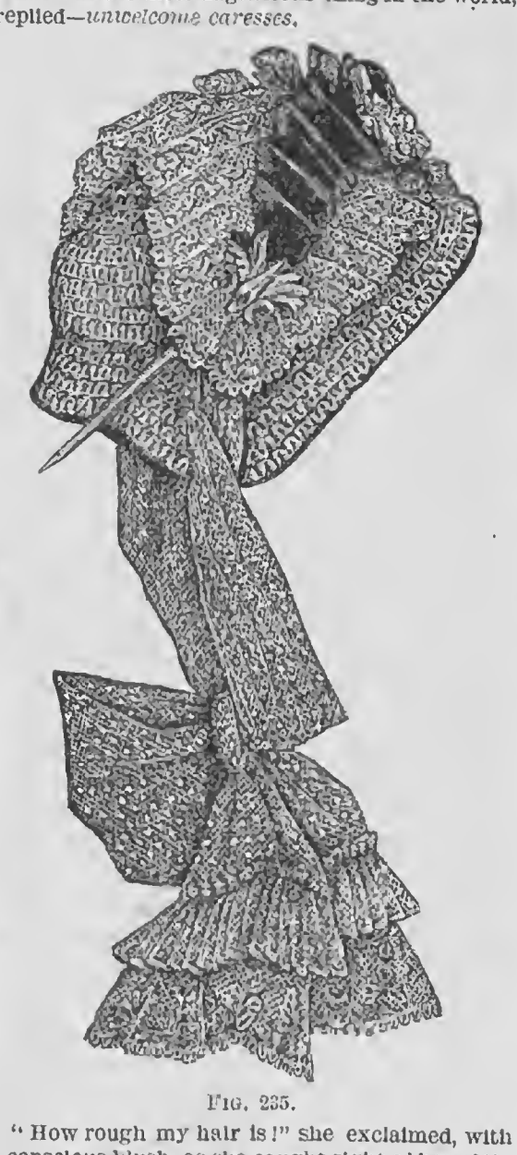

FIG. 235.

"How rough my hair is!" she exclaimed, with a conscious blush, as she caught sight of herself in the mirror hanging in the ante-room at Mrs. Abbott's. "I really cannot present myself in such untidy trim; I must put myself to rights. Wait a moment for me, Frank, I shall be back again directly; and remember you have promised not to dance with Cousin Kate."

And as she spoke she passed into the adjoining dressing-room.

The soft and dreamy strains of a popular waltz came upon Frank's ears. A velvet curtain over a doorway alone divided him from the apartment in which the dancing was going on. With an air of listless curiosity he drew it slightly on one side; as he did so, another hand was laid upon the curtain by someone who was about to quit the ball-room.

The next moment he found himself standing face to face with Cousin Kate.

How supremely lovely she looked! A flush was on her cheeks—a brilliant sparkle in her eyes.

"Why, Frank!" she ejaculated, holding out her hand, "how you startled me! I have not seen you for an age! Naughty boy! why did you not come and offer your congratulations? Is it because Miss Seton has the monopoly of your time?"

Then, without waiting for Frank to make her any reply—which in good truth he was too agitated and confused to do—she went on quickly:

"See; this delightful waltz is nearly over; but we shall have just time for one more turn round the room. Come."

"And before he knew where he was or what had happened, he found that vision of beauty reclining in his arms—her soft touch upon his shoulder her warm breath upon his neck.

Then, with a crash, the music ceased; the waltz was over.

Panting, flushed, and smiling, never, Frank thought, had his beautiful cousin looked so lovely, and at the same time came the agonizing thought that she was lost to him for ever—a double barrier stood between them.

"But was it really too late?" he asked himself. "Was there not time even now to change the current of the future?"

His brain felt dizzy. The image of his betrothed rose up before his mental vision, but he resolutely put her from his thoughts.

"Kate," he said, hurriedly, in tones of suppressed passion, "You were, I think, about to leave the room when I encountered you. Will you accept my escort?"

She placed her hand upon his arm; he felt it flutter as it rested there. Was she, too, thinking of and regretting the irrevocable?

He drew aside the velvet curtain, and they entered the ante-room together. He looked around it quickly, and gave a sigh of relief upon finding the apartment empty.

"For whom was that sigh?" asked Cousin Kate, half in earnest, half in jest.

"For you!" he answered, in a voice hoarse with suppressed vehemence; and then, carried away by the intensity of his passion, he, in a torrent of burning words, poured out the story of his overwhelming love.

In vain she tried to check his speech. His pent-up love had burst its bounds and carried all before it.

"Don't refuse me, Kate," he said, almost choked with emotion, "don't refuse me! Put aside the past! Be mine! be mine!

"Not a word more! Remember I am pledged to another!"

"Frank, are you mad or dreaming? Let me go. If you loved me as you say you do, why did you ask Kate Seton to be your wife?"

"That can be easily explained. It had its origin in a mistake. Yes—I repeat it—a mistake. The offer of marriage which she received was intended for you; but by some mischance—how it can have happened I know not—the letter was placed in the wrong envelope. But I do not love her—I cannot love her. I have tried hard to do so, but the affections will not yield themselves subservient to the will!"

These last sentences fell like the knell of doom upon the ears of poor Kate Seton. On returning from the dressing-room she found to her surprise that Frank was not where she had left him. Feeling pained a little, but far from guessing at the truth, the idea naturally occurred to her to draw aside the curtain and peep into the ball-room.

Then she felt her heart cease its pulsations—a suffocating sensation filled her throat—her life's blood seemed to turn to ice—for, despite his promise, Frank was dancing with his cousin; and worse still, she could read in his whole expression that Frank loved the girl he was then clasping in his arms.

Blinded, heart-broken, Kate groped her way to the dressing-room close by. It was unoccupied, but she knew it not. There was a large arm-chair near the door, and into this she sank, almost, if not quite, insensible. She struggled hard with the awful faintness which oppressed her, for she had now but one desire: to keep out of Frank's way—to get home unperceived.

Of Frank's passionate declaration of love she had heard or comprehended little. But she regained possession of her faculties in time to hear those concluding sentences, which explained how it was she had received the letter which had filled her breast with so much joy.

A scream rose to her lips; but with an effort she subdued it, and summoning all her strength, she left the dressing-room by another door.

Some little time afterwards Frank was informed that Miss Seton, who had been suddenly taken very ill, had gone home, attended by Mrs. Abbott's maid. She had desired her hostess to say nothing about her departure even to Frank Drayton. But Mrs. Abbott had not thought fit to obey her in this particular.

"She has heard all!" was his first thought. "I will follow her at once."

On reaching the residence of Mr. Seton, a servant said, in reply to his inquiries, that Miss Seton was indeed very ill, and could see no one. In the expectation that Mr. Drayton would call, she had left a note for him.

Frank's hand trembled as he broke the seal, for he felt guilty and ashamed.

The letter contained only these words:

"Farewell! All is over between us! Most unwillingly I overheard some of the conversation which passed to-night between you and your cousin Kate. You have used me cruelly; but as I see I am myself in some degree to blame, I forgive you for all you have made me suffer. Here is your ring and the letter which was never intended to reach my hands. You are free! My only aim now will be to forget you—my only hope that I shall never see you again!"

A pang of remorse—or was it some other feeling?—shot through his heart as he read these touch-

ing words. He could not trust himself to speak, but crushing the letter in his hand, left the house without another word.

Twelve months have rolled away, and it is again the eve of St. Valentine. Once more a little figure is crouching before the fire. The bright blaze falls upon her chestnut hair, and tips it with gold, just as it did a year ago. It falls, too, on her sweet face and reveals how much she has suffered in all that dreary time.

The hope expressed in her letter has been fulfilled. In the interval elapsed she has not once seen Frank Drayton. But has she succeeded in forgetting him? Ah! no, and she begins to fear she never will. In her hand is the same photograph, and she gazes on it now through a mist of unshed tears.

"Who would think," she murmured, "that the owner of that face could be so false—so cruel; and yet I am so weak, so fond, so deficient in woman's pride, that I feel I love him still. No—no. What do I say? I must and will forget him!"

And governed by this determination, she tears the photograph in two, and after one last lingering look, flings it into the fire.

The fiery tongues devoured the pieces of cardboard in an instant.

"How wretched I am!" she thought, "and last year I was so very—very happy!"

And with a burst of anguish she buried her face in the soft cushions of her mother's chair.

Absorbed in her grief, she did not notice the noiseless opening of the door, nor the appearance of the servant who stood upon the threshold. He paused irresolutely, and then another figure stood beside him. The new-comer made an imperative gesture for the domestic to withdraw, and the door closed silently, leaving the stranger in the room. It was some time before he moved. He saw the dark figure kneeling by the chair—her stifled sobs came softly upon his ear. At length he advanced. On the thick carpet his footfalls made no sound. He reached her side unnoticed, and then bending forward, touched her with an unsteady hand. She looked up quickly.

"Frank!" she exclaimed, for she recognized his tall figure at a glance. "Frank!"

There was a world of reproach, of surprise, and yet of tenderness, in her tones.

"Kate!" he said, in a voice broken by emotion, "forgive me for intruding upon you thus; but I could keep away no longer. That I am here in opposition to your wishes I am well aware; but I felt the irresistible desire to see—to speak to you once again—must be my excuse. You shrink from me!" he added, in pained accents. "Do not—oh, do not send me from you till you have heard what it is I wish to say."

"I will listen," she said, faintly; "but do not keep me long. I am far from strong and——"

"Kate, dearest," he interrupted in a broken voice, advancing a step nearer to her as he spoke "I have come to-night to entreat you to forgive me for all I have done—for all the anguish I have made you suffer. I have come to tell you that the mad passion—I will not profane it with the name of love—which I had for Cousin Kate no longer has the shadow of an existence. It died out that night—that night when I received this letter and this ring. Those words of yours bidding me farewell revealed to me, like a flash of light, the enormity of my mistake. I knew then that it was love I felt for you, and that the other was an insensate infatuation. Can you guess what my feelings were when I made the discovery? I wrote to you; but every letter came back with the seal unbroken. I tried to see you but was denied admittance. It was not till to-night that I was enabled to gain access to you. Speak to me, Kate—speak to me, or do I plead in vain? If you fear my proffered love is likely to prove transient, dismiss the thought. Twelve months is long enough to test the reality of my affection. In all that time it has never swerved, and through all time to come I give you the assurance that it never will. Speak to me. That you have listened to me so long gives me hope. Will you accept the love I offer you? Will you let the past be as though it had never existed? Will you forgive me? Will you be my wife?"

His tones, words, manner, all proved the sincerity of every word he spoke, and appealed irresistibly to Kate's loving heart. But even if it had not been so, there was a still stronger advocate for him in her own breast. She was, however, too agitated to utter a syllable. At the last words she gave a step forward and sank helpless into his arms. She felt herself pressed tightly in his embrace; she felt kisses showered upon her lips and brow; and the next moment she felt the engagement-ring was once more slipped upon her finger.

"Ahem!" said a voice.

The lovers started, and looked up, surprised to find they were no longer alone.

Frank was the first to recover his self-possession. Keeping Kate prisoner with one hand, he held out the other and exclaimed:

"My dear Mrs. Seton, I am indeed most happy to inform you that the misunderstanding between your daughter and myself no longer exists, and there remains nothing now but for Kate to fix the day when I may have the happiness of making her my bride!"

MAGAZINES FOR JULY.

D.; Editorial Notes; Miscellaneous; Archæology and Ethnology; Art and Architecture; Geographical Explorations; Proceedings of Societies; Index of Articles on Archæology, Anthropology and Ethnology.

CLEOPATRA'S NEEDLES.—The remarkable obelisks which have been known to the world under the sigular cognomen of Cleopatra's needles, and which are now being removed, one to England and the other to the United States, have a much more interesting archæological interest than is generally supposed. They were taken from the celebrated quarries at Syene, and were, like others, constructed in the usual tapering form symbolizing the sun's rays. The material of which they are composed is a rose-colored granite. Pliny states that they were transported to the Nile with the aid of flat-bottomed boats, floating in canals especially prepared for that purpose. It is supposed that they were afterwards erected to their place by making a groove at their base, in which they might turn as a hinge, and then building a mound of earth, which increased in size as the top of the shaft arose, until the monument stood erect. They were originally set up by Thothmes III, one of Egypt's greatest rulers, at Heliopolis, or the City of the Sun, as early as 1,600 B. C. They were transported to Alexandria under Tiberias, and set up in front of Cæsar's temple, where they obtained the name which they bear. The name was given to them because of a tradition that they were removed to Alexandria during the reign of Cleopatra. The obelisk removed to England is 68 feet five inches high, and contains on its two faces hieroglyphs expressive of the titles of Thothmes III; on the other two Ramses II has added his own, illustrating only the pomp and vainglory of these monarchs, but absolutely destitute of historical information. The other obelisk on its way here contains many similar inscriptions, and was erected by the same monarch. The significance to the Bible student which these remarkable monoliths possess, is not so much in their inscriptions or their forms as in the fact that they were probably standing in front of the great temple to the Sun when the Israelites were in Egpyt. They also remind us of the two pillars Jochin and Boaz, which Solomon erected in front of his temple. Such obelisks were always erected in pairs, and were most common and prominent symbols of worship at the east.—Biblical Review.

THE AMERICAN NATURALIST.—CONTENTS.—The use of Agricultural Fertilizers by the American Indians and the Early English Colonists; A Sketch of Comparative Embryology; List of the Birds of the Williamette Valley, Oregon; A Botanist in Southern California; Progress of American Carcinology in 1879; The Structure of the Eye of Trilobites; Recent Literature; General Notes; Zoology; Anthropology; Geology and Palæontology; Geography and Travels; Scientific News; Proceedings of Scientific Societies; Selected Articles in Scientific Serials.

This periodical continues to supply its readers with valuable matter. Many of the articles are calculated to be of interest to persons who are not deeply impressed with scientific research.

We are in receipt of Fashion Magazines as follows:

Domestic Monthly, Butterick's Delineator, Demarest's Monthly, Ehrich's Quarterly.

These, though varied, are all devoted to the particular styles of the season.

VICTOR HUGO'S MARRIAGE.—It was no play-work his student life, rising early and toiling late over prose and verse; poems for prizes, articles for magazines, anything that would "sell," and procure the daily bread. More especially as the youth, still a boy in years (he was scarcely 17), had chosen to engage himself to the daughter of his father's old friend, M. Foucher, who on her side was little more than a child, and could bring him no fortune whatever. The parents protested, Victor persisted, and Mlle. Adele proved faithful, though there seemed at first but small chance of their constancy being rewarded. When he first wished to publish a volume of short poems which had appeared from time to time in one of the periodicals, no publisher could be found to undertake the risk, Abel Hugo, however, generously came forward and paid for its publication; while the bookshops refusing to allow the modest volume so much as a place in their windows, it was exposed for sale through the kindness of a personal friend. The book was entitled "Odes et Poesies Diverses." Fortunately for its author, the first person who happened to buy it was M. Menechat, Reader in Ordinary to Louis XVIII., who brought it under the King's notice. Its success was so rapid as to exhaust the first edition, 1,500 copies, within four months. This, of course, brought him in a certain amount of ready money; not much, one would think, seeing that the publishers reserved to themselves 3 francs out of the 3 francs 50 centimes, which was the price of each volume; still the author's portion served to buy a magnificent cashmere robe for the "*corbeille de noces*," and when, about the same time, he received the first fruits of a pension of 1,000 francs per annum granted him by the King, he felt justified in demanding the hand of Adele, and they were married at St Sulpice in the year 1822, Victor being then 20 and his bride 18 years old.—Temple Bar.

SPECULATOR to old miner in Leadville, handing him a bag of samples, "Gold quartz or carbonates?" The honest miner turned it over in his hand indifferently, took out his knife and picked at it awhile, and then asked: "Got much of it?" "Thousands of tons," answered the other eagerly; "how much do you suppose she'll run?" "Can't tell nothin' without an assay." "But you can guess, can't you? You can guess?" "Oh, yes, anybody kin guess, but a guess is liable to be extravagant. Now, I should say—but mind ye, I may go over the mark—I should s-a-a-y," turning the specimen over again and holding it up to the light—"I should s-a-a-y that if ye can save the gold in this, and catch the silver, and not waste the lead, that it might run about—well, about two dollars to the county."

WHEN M. De Lesseps was getting up his Suez Canal, a gentleman afflicted with Anglophobia called on him and expressed his desire of subscribing for his railroad in the island of Sweden. "It isn't a railroad. It's a canal," said M. De Lesseps. "That makes no difference." "It isn't an island. It's an isthmus." "Put my name down all the same." "But it isn't in Sweden. It's in Suez." "All right. I don't care what or where it is. All I know is, the English don't like it; so I want to help it on." Another enthusiast wrote—"Yield not an inch to perfidious Albion. If necessary, move your isthmus elsewhere. Your shareholders will follow you."

THE MULE PUZZLE.—Draw a circle fifteen feet in diameter, place a mule in the center and walk around him without getting out of the circle.

DON'T FAN FIRE.

IF you should come up stairs some day and see a little smouldering fire just starting in one of your floors, stealing stealthily into the carpet, you would not be very likely to sit down beside it and fan it, much less would you run over to a neighbor's and have her bring the bellows to help blow it up. Not if you were a woman in her right senses. You know quite well what speedy measures you would take to smother or quench it out.

Dear young housekeepers, there are worse fires which start up silently in homes than were ever kindled by Lucifer matches. They begin small. Cross words usually start them, but how the fire spreads when once kindled, if only it gets a little fanning! One sure way to fan the blaze is to run over to a neighbor's and talk your trouble over. Tell just how unreasonable John is, and how little he sympathizes with your trials, and unless your friend is an uncommonly wise woman, you will go home more wretched than you came, and feeling harder than ever toward John. You have gained nothing, but you have furnished food for considerable scandal, for nothing travels faster than the ill news that "so and so don't get along well together." That which was only a transient flash of ill-temper has been blown into a conflagration that is likely to burn up your domestic happiness.

Some one says if there is ever anything for which we are thankful, it is for angry words not spoken. I would add for angry words we did not exhibit before the world. Better keep them locked up in their closet. They will not shock or harrow your sensibilities half so much there.

Only possess your soul in quietness, and the fire will die out. If your inmost consciousness tells you that you have the true and devoted love of your husband you will not be much moved by little things. Tears and life's mutual joys and sorrows will draw all true hearts closer to one another, and the once vexatious things will seem like trifles, as you glance backward over them.

Remember that nothing helps along domestic troubles like talking over them; nothing smothers them like silence. A little patience and self-command and the flash dies down. And, oh! how glad you are that the fair fabric of your home happiness has not been consumed. AUNT LOIS.

NOTE.—"Aunt Lois" is requested to send her address. E. M.

CANE AND GRAPE SUGAR.

PROF. KEDZIE gives us the following valuable bit of domestic information: Cane sugar is two and one-half times as sweet as grape sugar, closely allied to it, and differs so little from it that some persons cannot distinguish it. By cooking, the cane sugar may be changed to grape sugar, and thus lose its sweetening power. Some women put the sugar in with a mass of acid fruit to be cooked, and keep cooking and adding sugar while it keeps on growing sourer, until at last they use two and one-half times as much sugar as they need to secure the desired result. The cane sugar has been changed to grape sugar. Now if the sugar had been added after the fruit was cooked, much less would have been required, and the result would have been far more satisfactory.

FOLDING DOWN SHIRTS, COLLARS, ETC.

WE are in the habit of using corn-starch when folding down our shirts, collars, etc., and think it superior to laundry starch for that purpose. Dissolve a tablespoonful, rounded, —in a quart of water and add as much white sugar as can be taken up between the thumb and first finger. Roll up tightly and let remain several hours before ironing. But to meet with any success with the raw starch, the boiled starch should be of the best quality, properly prepared, and the clothes dried quickly and thoroughly.

DOMESTIC RECIPES.

Warts.

THE expressed juice from the leaves of the common arbor-vitæ will cure warts. Apply each day for three or four weeks.

Meat Cakes.

Take scraps of meat free from bone and gristle and chop fine. Season with salt, pepper, parsley or onion. Take any remnants of dry bread, soak in water until soft, press dry and mix with the meat—about half and half. Add one or two eggs, form into little flat cakes and fry quite crisp. E. A. L.

Green Pea Cakes.

Mash two cups of cooked peas while hot; season with butter, pepper and salt; when cold stir in a beaten egg, a cup of milk and a small cup of sifted flour having a teaspoonful of baking powder mixed with it. Fry as you would griddle cakes. A. L.

The Best Dried Yeast.

One dozen potatoes; three handfuls of hops; five quarts of water. Wash the potatoes clean but do not pare them. Put them on to boil with the hops and water, and boil one and one-half hours. Mash the potatoes well, in with the hops. Put one quart of flour in a crock and pour the mixture boiling-hot through a sieve on the flour. Stir it well, and when milk-warm add one pint of good yeast. When light take two-thirds corn-meal and one-third flour, pour the yeast in, stir it around well, spreading on a table to dry. It never fails, and will keep six months.

Water-Melon Pickle

Take the rinds of a melon; pare the green off very thin and then soak them over night in weak, salt water. In the morning drain and boil in water with a small piece of alum, until tender; then make a sirup of vinegar, sugar, cinnamon bark, cloves, and allspice, and boil a little while in this. Seal while hot. Very nice. MRS. G. MC. F.

To Clean a Toilet Sponge.

Buy five cents' worth of hydrochloric acid and dilute with four or five quarts of water. Put in the sponge, squeezing and working it with the hands until perfectly free from all grease. Afterwards rinse in clear water.

John Boldin's Prize Recipe for Salad.

From six or eight coss (or cabbage) lettuces remove outer and coarse leaves and strip from remaining ones the good part. The pieces should be two and one-half to three inches long and may be broken up, but not cut; then wash them and let them remain about half an hour in water. Rinse in second water, place in napkin and swing till dry. For dressing, take the yelks of two hard-boiled eggs, crush them to paste in bowl, adding one-half tablespoonful French vinegar, three mustard-spoons mustard one salt-spoon salt and beat up well together; then add by degrees, six to eight tablespoons of Lucca or Provence oil, one of vinegar and when thoroughly mixed, a little tarragon finely chopped, a dessert-spoon coarse white pepper, as pepper in powder irritates the palate. When all is well mixed, place the salad in it and turn over and over, thoroughly and patiently, till there remains not one drop of liquid at bottom of bowl. Put the white of the eggs in slices on the top and serve shortly after it is mixed.

Ideal Strawberry Shortcake.

Take one quart of flour; three teaspoonsful baking powder; one pint of milk and one-third cup of shortening (which should be two-thirds butter and one-third lard.) Make the paste as soft as possible for rolling it out. Bake in two layers. When baked, cut off the upper crusts; butter the lower crust of one layer and spread it over with strawberries, which have already been sugared and partly crushed. Upon this place the crust; butter and spread with the berries as before, Another layer of paste, berries and sugar can be used if desired, or make into separate cakes. In the meantime, beat the whites of two eggs to a stiff froth, with a sufficiency of pulverized sugar. Spread this thickly over the top layer of berries; put in the oven and let it bake until the meringue is a delicate brown. Serve with rich sweet cream, or with crushed berries and their juice with sugar. MRS. JOHN E. SWEET.

News of the Week.

MISCELLANEOUS NEWS.

Monday, July 12th, 1880.

An exceedingly interesting experiment is at present taking place at Clarendon Hall, East 13th St., this city. A man named Dr. Tanner is there voluntarily starving himself for the purpose of demonstrating to the world that life is comparatively independent of food, and that he, at least, can live for a much longer period, without partaking of any nourishment whatever, than has hitherto been sanctioned by science. Dr. Tanner hails from Minnesota, and he says he has there at one time fasted forty consecutive days, and he proposes to perform the same feat here. He has already passed through thirteen days of his course of starvation, and he is confident that he can complete the proposed forty days' fast without difficulty. The hall is open to the public and he sleeps and spends his entire time under the public eye. Two doctors of medicine are constantly watching him to make sure that no nourishment of any kind passes to his lips, the watch being changed every six hours. Nobody is permitted to communicate with him without being overheard by his guard, and every article that he needs for comfort undergoes the strictest examination for possibly concealed food, before he is permitted to get it in hands. He spends much of his time in reading, but even a daily newspaper is examined as scrupulously as if it were possible to hide a good-sized ham in its folds.

During the first five days he lost over two pounds of flesh a day, but after that the loss gradually subsided and he is now even gaining perceptibly in weight. At first all visitors to this peculiar exhibition were admitted without charge, but it was soon found necessary to fix upon an entrance fee in order to keep out the numerous loafers by profession who found the hall a very convenient place to spend their time, and now an entrance fee of twenty-five cents is charged. Medical men, according to whose predictions he ought to have died several days ago, are losing faith in their own skill, and many expect him to drop dead at any moment; meanwhile Dr. Tanner continues active, in apparently good health and in full possession of his mental faculties. The interest increases with each passing day, and we shall keep our readers informed upon the subject until the close of the cruel experiment.

About the 22nd ult. Victoria's Apaches attacked Gov. Louis Terrasa's ranch at San Lorenzo, about thirty miles from Chihuahua, killed some men and stole about one hundred horses. They then attacked Ranch De Santa Clara, about sixty miles from Chihuahua, killing some more men and stealing a large number of horses. Gov. Terrasa, with two hundred federal Mexican troops and a large body of volunteers, is in pursuit of the band, the trail leading toward the Sierra Guzman. Gen. Hatch is making active preparations for another campaign upon Victoria's return. Maj. Morrow is ordered to Knight's ranche, and is to scout that section of the territory. Col Buell is ordered to Fort Cummings, and will have a force of nine companies of cavalry and five of infantry, and will scout and guard the frontier from Fort Cummings to the Rio Grande. Detachments are being placed at all exposed points, mining camps and ranches. Two companies of cavalry and five companies of the 13th infantry are now en route to the Navajoe Indian agency, to keep the Navajoes quiet. A force of two companies of cavalry and one of infantry has been stationed at the Mescolvra Indian reservation, and the reservation has been turned over to the military.... The loss caused by the recent breaking of the Sny levee on the Mississippi river, near Quincy, Ill., is placed at $1,000,000. The crevasse at Cincinnati landing is half a mile wide, and there are other breaks. The levee protected a stretch of country 70 miles long and from five to 12 miles wide, and a third of the tract, or fully 200,000 acres of cultivated land, is overflowed.... The census man has struck something interesting away down east in Oldtown, Me. He found and "enumerated" a youth 12 years old, named Joseph H. Fortier. He is the fifth in succession bearing the same name. A further circumstance is that each of the five was the first-born, and all five were born on the first day of April.

Seth Green's attempt to grow salt-water fish in fresh water proves a failure, the shad and alewives put into Lake Ontario dying in such numbers that the stench of their bodies is well-nigh intolerable as they are washed upon the shore. Each fish has a yellow spot with red edges on some part of the body, but it has not been determined whether it is due to a parasite or the freshness of the water....One of the schemes for practical telephoning at long distances has taken shape in the formation at Albany of the Interstate Telephone Company, which is to construct a line from Boston to Washington. The enterprise seems to be in good hands. Ex-Secretary Benjamin H. Bristow is one of the directors, and with him are associated on the board Charles S. Smith, Frederick Kuhne and others....What is called the largest elevator in the world has been finished for the Washington monument. It will carry 10 tons to the hight of 500 feet and, after hoisting the material for finishing the monument will be transformed into a passenger elevator.... St. Louis was so "hopping mad" when the census supervisors retured but 275,090 inhabitants as her quota, that a number of public-spirited citizens subscribed a fund to pay the letter-carriers for finding out just how many had been missed. The carriers have turned in 24,900 names overlooked altogether, and, while this leaves the Mound City 100,000 behind rival Chicago, they conceal their chagrin under a bitter attack on the careless enumerating which skips one name in every 15.... The locomotives used on the railroads of the United States are doing the work of over 29,000,000 horses, while the census of 1870 aggregates horses of all ages at less than 9,000,000....Two thousand eight hundred and ninety-seven vessels, 1,075 steamers and 1,822 sailing vessels, cleared from New York for Europe during 1879 carrying 102,318,568 bushels of grain.....A pretty story comes from Nantasket Beach. Miss Hall, a young lady of Boston, quarreled with her lover one day last week, and to spite him went on a fishing excursion with a party of young folks, the lover being excluded. A little way from the shore the boat capsized, and Miss Hall was dumped into the sea. The young man swam promptly to the rescue, and, though Miss Hall would have been saved anyhow, her lover got the credit of saving her life.... The American Institute of Instruction was in session at Saratoga, N. Y., last week. Wednesday evening Rev. George R. Ellis read the paper prepared by Rev. Dr. Barnas Sears on educational progress in the United States during the last 50 years. During this period the school system of New England has spread over all the Western States and in the last 10 years has made good progress South....Turkey and Greece seem to be preparing for war, Turkey declining to accept the decision of the late German conference. In Greece the enlistment of volunteers, principally Epirotes and Thessalians, is proceeding rapidly. Troops are concentrating on the eastern and western frontiers, in consequence of the concentration of Turkish troops and also to prevent brigand inroads.

AGRICULTURAL NEWS.

THE seventeen-year locusts have appeared in countless numbers in western Pennsylvania and West Virginia, and the air is filled with their peculiar noises. They do but little damage to vegetation, the principal injury being the stinging of the ends of the branches of oaks and chestnuts, which kill the extremities thus punctured..... As many as 15,000 horses and mules are said to be employed at Leadville, Colorado, hauling supplies and doing other work. It is estimated that these animals consume 3,000,000 pounds of grain and hay per annum, or the product of 37,400 acres, being a much greater extent of land than the State sowed last year.....As passed by Congress, the agricultural appropriation bill devotes $7,500 for experiments in the manufacture of sugar from sorghum and cornstalks, and now provides for an additional chemist and proper appliances..... There are now 80,000 head of cattle and 8,000,000 sheep on the hills and plains of California—a respectable increase since 1796, when the Spaniards there began the business of stock breeding..... In 1876, Russia made her first exportation of sugar, but now has half a million of acres under sugar beets, and sends 65,000 tons of sugar, from her 300 factories, across the frontiers.....In Oregon this year the seasons are luke warm and cold. Peach trees as far south as Portland were nearly all killed by the severity of the Winter, and the delicate species of grapes so successful in California, fail entirely in Oregon. Wheat raising and salmon fishing are their productive industries..... A cablegram from London on the 9th says that grain crops have been almost ruined by immense swarms of insects in several parts of Russia, and and that the harvest in many parts of Germany will be considerably poorer than was confidently anticipated a short time ago..... A Pesth dispatch of July 7, says: "The harvest has begun and promises fairly."..... A dispatch from Dublin of the same date, says: "The weather all over Ireland up to the present has been most favorable. It is expected that the potato crop will be enormous. It promises to exceed anything seen in Ireland since the period anterior to the famine of 1847. Root and cereal crops are also luxuriant."..... According to a cablegram of July 8th, the reports from different provinces of the Prussian monarchy on the harvest prospects prove that the alarm which arose after the cold days of May, was in a great measure justified. The corn harvest will be very small in all the northern districts, and it is reckoned that only 50 per cent of the ordinary harvest will be got in. Reports from Russia, Hungary, and Galicia also announce that a great deficit is expected..... In response to a letter of inquiry as to the proper construction of the act passed by the last Congress amending the Internal Revenue laws so as to exempt certain dealers in leaf tobacco from the the $25 license tax, the Commissioner of Internal Revenue on June 18 made the following decision: *First*—In regard to the amount of leaf tobacco branded by such dealers, their sales and consignments cannot exceed 25,000 pounds in any one special tax year. *Second*—This class of dealers can only purchase or receive leaf tobacco in the hand. *Third*—Dealers under this $5 special tax can only sell or [illegible] for sale, or consign for sale on commission, such leaf tobacco as they purchase or receive directly from farmers or planters who have produced the same on land owned, rented or leased by them, or received as rent from tenants, etc. Dealers in leaf tobacco who purchase or receive tobacco from persons other than farmers or planters who produced it themselves, or received it as rent from their tenants who produced it; that is to say, all persons who purchase or receive leaf tobacco which has passed from the possession of the producer, or his landlord, into the possession of other parties, and sell, or offer it for sale, or consign it for sale on commission, are liable to pay the special tax of $25, irrespective of the amount of their sales or shipments in any one special tax year.....There has been a considerable disturbance at St. Paul lately among grain dealers and others about rumors of the prospective failure of the wheat crop in Minnesota. The worst reports came from the southeastern portion of the State, where rust, blight and chinch bugs are said to be ruining the crop. Reports from other parts of the State are less gloomy, but along the St. Paul, Minneapolis and Manitoba railroad it is claimed that it has suffered greatly from excessive rain and hail storms. Telegraphic inquiries made through the State show that these reports are greatly exaggerated. The wheat crop in the southeastern part of the State, on old lands and near the river, has suffered greatly from wet weather and floods. The warm weather following rain has induced rust. Wheat, though not yet dangerously injured, will become so unless checked by cool, drying days this month. On some of the low lands near the river, something like blight appears to have attacked the stalk. Several counties are suffering severely from chinch bugs. As the result of all these causes, it is estimated that the crop in Olmstead, Winona, Wabash, and Houston, all heavy wheat-growing counties, will fall from 20 to 35 per cent. below the average. In the southwestern and central frontier counties the outlook is much better, while the reports of damage in the north and Red River Valley are thought to be without foundation. There the weather has been favorable since the storms ceased, and the prospect for a crop of good quality is excellent. The serious damage is confined to the southeast..... The Mark Lane Express of July 5, in its review of the British grain trade the past week, says: The weather has been fairly seasonable, and crops have made further steady progress, though advices relative to oats are somewhat variable. The supply of English wheat is very small, but difficult to sell, though holders willingly offered concessions of one and sometimes two shillings per quarter. Imports of foreign wheat fair, but not excessive. Though granary stocks are reduced to almost an unprecedented point, yet as long as the arrivals suffice to meet the immediate wants of buyers, they can afford to disregard the present moderate extent of arrivals in the confident anticipation of a future abundance, to which everything seems to point. A large Continental demand has hitherto been the chief influence in favor of sellers; but, as the French harvest is now almost due, Continental needs must shortly cease to affect the situation. In short, the weather, despite some rain, has been too fine for the trade. Wheat declined one shilling to two shillings in the week. Even Russian has fallen, despite the extreme scarcity. Business of all descriptions very limited.

COTTON IN 1880.—The following table of the prospective cotton crop of 1880, is taken from the New York Financial Chronicle

States.	Actual Acreage. 1879.	—Estimated, 1880.— Increase.	Acres, '80.
North Carolina	624,089	8 per cent.	674,016
South Carolina	986,370	11 per cent.	1,095,760
Georgia	1,744,048	10 per cent.	1,918,452
Florida	222,705	3 per cent.	229,396
Alabama	2,122,422	8 per cent.	2,292,216
Mississippi	2,117,101	3 per cent.	2,180,614
Louisiana	1,295,250	4 per cent.	1,336,660
Texas	1,684,631	17 per cent.	1,971,018
Arkansas	1,132,886	16 per cent.	1,314,147
Tennessee	761,460	15 per cent.	875,679
Total	12,679,962	9.51 per ct.	13,885,947

There are three or four other estimates, such as that by the Agricultural Department, and that by the Cotton Exchanges of the South, all of which differ a trifle in the estimate of the yield and area under the crop; but all agree that it will probably be an exceptionally large one.

False Reasoning.

Suppose a machine should fail to perform its work, and the owner, instead of trying to ascertain the cause of failure and remedy it, should conclude to run right along, and argue that as the machine had heretofore come around all right it would soon be so again, if a general and permanent break-down ensued could anybody be blamed but himself? Now, precisely in this way do people act and argue when the "human machine" is out of order. When the liver is "torpid" and bowels constipated every one knows that Dr. Pierce's Pleasant Purgative Pellets afford prompt and permanent relief. Yet some *guess* the "machine" will come around all right, and do nothing. Could any system of false reasoning be more pernicious? Suppose the blood be out of order and there be pimples, ulcers or running sores with scrofulous tumors, swellings and general debility, and those thus affected should refuse to use Dr. Pierce's Golden Medical Discovery, *guessing* that the blood would purify itself, could anybody be blamed but themselves, if a general and permanent break-down of health ensued? No remedy yet known equals the Discovery in curing all scrofulous, throat, bronchial and lung diseases. Sold by druggists.

The Universal Verdict.

The Youths' Companion, one of the most conservative papers published, says of the Robbins's Family Washer and Bleacher:

"This washer is very simple in construction, yet it is the *best* we have ever known. We speak from *experience*, when we say this. It is truly the woman's friend, for with it the hard work of washing almost disappears. Every housekeeper knows that ordinary modes of washing are apt to wear the clothing. With the Robins's Washer there is absolutely no wear at all, even to the most delicate lace fabric. We have known of this washer for several years, but we had no idea that it was such a prize until we were induced to give it a trial, and now with us it has taken its place as a household necessity."

It is manufactured and sold by the BISSELL M'F'G Co., 50 Barclay Street, New York.

THE AMERICAN BOOK EXCHANGE.—This house, which is advertising standard and valuable books so largely, at such marvelously low prices, reports a remarkably lively business for the season of the year, a season when people are not supposed to read much "solid" literature, and booksellers "go fishing" because they have no customers. Not a day passes that they do not receive telegraphic orders. The little three-cent books are going at the rate of nearly 100,000 a week. The "Library of Universal Knowledge" has already reached a sale of nearly half a million volumes.

Kidney-Wort is a remedy which removes foul humors from the blood, and creates healthy action in every organ. Sold by all druggists.

Torpid kidneys and liver lead to gravel, diabetes, constipation, piles and rheumatism. Kidney-Wort is the surest and safest remedy to use.

Write to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for names of ladies that have been restored to perfect health by the use of her VEGETABLE COMPOUND. It is a positive cure for the most stubborn cases of female weakness.

Ex-President Martin Van Buren was made comfortable by the use of Jonas Whitcomb's Asthma Remedy.

The Markets.

SPECIALS FROM ALL CENTERS.

Until Saturday, July 10.

Butter, Cheese and Eggs.

Baltimore.—BUTTER.—The current demand from the trade keeps the stock down to the limit of the daily receipts, and the market is firm at previous figures. We quote New York Creamery at 22@23 cents, New York State new at 18@21 cents, Western new at 15@16 cents for choice, and 12@14 cents for good to prime, and near-by stock at 11@15 cents per lb for good to choice. CHEESE.—The demand has improved, principally for export, and the market has recovered from the late depression. Prices are higher, especially for the better grades. We quote New York State 10@10½ cents for choice and 9@9½ cents for good to prime, and Western Factory at 8@8½ cents for choice, and 7@7½ cents for good to prime, and 5@6 cents for fair to good. EGGS.—The supply is good and the market is quiet but rather more steady. We quote strictly fresh at 11 cents per dozen and 12 cents for near-by. State stock is dull and nominal.

Boston.—BUTTER.—The market is a little stronger than last week, and the fact that prices have improved in New York, and that butter costs more in the interior, has rather stiffened prices of fine grades here. NORTHERN—Choice creamery, 21@23c ₩ lb; choice New York dairy, 20@21; choice Vermont, 21@22c; fair to good, 16@17c; common, 13@15c. WESTERN—Choice creameries, 22@23c ₩ lb; fair to good, 19@20c; choice dairy-packed, 17@19c; choice ladle-packed, 15@16c, common, 13@15c. CHEESE.—The market is somewhat unsettled, and prices have now reached a figure where buyers are afraid to take hold very sharply. The receipts of last week were all cleaned up, and there is hardly an established price to-day. The sharp advance since last week, however, seems to have had its edge taken off, and prices promise to be easier. Fine factory, N. Y. and Vt., 8½@9c ₩ lb; fine factory, Ohio and West, 8@8½c; fair to good, 6@7c; skims, 3@5c. EGGS.—There has been a pretty firm market since Monday, and prices are a little better. Eastern, 13½@14c ₩ doz.; New York State, 13½@14c; Canadian, 13@13½c; P. E. Island, 13@13½c; Western, 11@12½c; egg oats, 38@42c.

Chicago.—BUTTER was in very good demand, and prices were sustained at the following range, Creamery, 19@21c.; good to choice dairy, 14@17c.; packing stock, 10@11½c.; grease, 5@8c. CHEESE.—Stocks at this point and throughout the West are particularly light, and the market is showing a strong upward tendency. Liverpool was quoted at 65s. on yesterday, which is 1s. advance since Saturday last. We quote good to prime full cream cheddars at 8@9c. ₩ lb; prime part skimmed do. at 7@8c.; flat skimmed at 5@6c.; and hard skimmed and sour stock at 3@4c. EGGS were slow at 6½@10c. per doz. The supply continues liberal, and the packages generally have to be repacked after they arrive.

Cincinnati.—BUTTER—Packers buy any apparent surplus, and have paid and are still paying ½@1c. ₩ lb more than last week. The bulk of the sales are at 13@15c., but selections bring 1@2c. more, and packing grades 11@12½c. The quality of much of the Creamery is not first-class, and a large part of the current supply sells at 20@21c., but 22c. is the price for that perfect in flavor and condition. As a whole, the market is stronger than a week ago, and there is no accumulation of stock in receivers' hands. Fancy Creamery sells at 21@22c., and prime at 19@20c.; choice Western Reserve and Dairy at 15@17c; prime Central Ohio at 13@14c., and common at 10@12½c. ₩ lb. CHEESE—There was a further decline since our last weekly review of ½c ₩ lb. with sales of prime to choice factory at 7@7½c. ₩ lb, but an advance in New York has caused prices to rally, and it is held at 7½@8c. ₩ lb at the close. EGGS—Have been in ample supply and have not varied much, but the market closes slow and easy at 9@9½c. per dozen loss off.

Philadelphia.—BUTTER of fine quality continued scarce and in good demand at full and improving prices, and there was enough doing in medium to good grades on home account to prevent accumulations. Hence the whole market was in good shape and favored sellers. There were no choice rolls here. Prints were active and firmer. We quote creamery extras at 23@24c. in lines, and 25c. in a comparatively small way: do. good to choice, 21@22c; imitation creamery, 15@18c., as to quality. Bradford tubs, extras, 21@22c; York State tubs, extras, 21@22c; fair to good, 17@19c; Western dairy fancy, 18@19c—little of this kind here; do fair to good at 12@16c factory packed, 13@15c as to quality; common grades 8@9c; Rolls, 9@12c. Prints, fancy at 20@23c. do. firsts at 25@28c. do seconds at 15@22c. EGGS.—The market held firm under a steady inquiry and continued small supply of choice stock. We quote inferior Western at 10@13c. as to condition; fresh do. at 14c, and Pennsylvania, New Jersey, Delaware and other near-by fresh brands at 15c. CHEESE was firmly held under a fair inquiry and light supplies, but the market has apparently reached the top for the present, and freer receipts and offerings will probably weaken values. We quote New York factory choice at 10c do. fair to good 8@9c; do half skims 7@7½c. Ohio flat fine 8@8½c; do fair to good, 6½@7½c. skims, 3@5c, as to quality.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 10, 1880.

BEANS AND PEAS.—The detrimental effect of hot weather upon stock has made prime quality of standard beans very firm. Under grades plenty and weak. Trade moderate throughout. Green peas quiet at $1.60. Prime Northern B. E. higher: $2 per 2 bush. bag. Many parcels begin to show bugs.

Marrow beans, prime, $1.52½@1.55; other, $1.41@1.50; medium, prime $1.32½@1.35; other, $1.25@1.30; pea, $1.45@1.60; white kidney, $1.85@1.85; red kidney, $1.25@1.40; black (or turtle soup), $2.20@2.25; Cal. Lima, $5.00.

Receipts of beans per week, 964 bush.; exports, 311 pkgs.

LEATHER.—Quotations are: for hemlock sole, 22½@23½c. for light; 22½@25c. for middle; 22½@24c. for heavy, and 20½@22c. for good damaged.

BEESWAX.—There is little doing with prices steady; Western and Southern quoted 22½@24c.

BROOM CORN.—Trade is slack and prices steady. Brush and short broom, choice, per lb., 7@8c.; common to good, 5@6½c.; hurl, good to choice, 7@8c.; do., common to fair, 5½@6½c.; red and crooked at 3@4c.

BUTTER.—The market is fairly steady. Fine State creamery is not plenty and holders of perfect lots can obtain a cent more than last week. Western cream

ery goes mainly to exporters. State pails and tubs run irregular in quality and as sellers retain very nearly late prices a good deal of the average local trade has turned to Western. Supplies from nearby dairies are very small owing to shortened pasture, and any surplus milk can find a ready city market in its fluid state. Export trade only fair, 8,100 pkgs. for the week. Receipts, 34,500 do.

Creamery, best State, do., Western, good to prime, fair to good, sweet cream, 19@21½c.; State factory, yellow choice, 21c; fair to prime, 18@20c.; pails and hf. tubs, choice, 20@21c.; good to prime, 19@ 0c.; fair to good, 18@19 .; poor, 15@17c.; Welsh tubs, prime, 19@20c.; other, 15@18c.; Western imitation creamery, 13@17c.; dairy, fresh, 16@17c.; fair to prime, to 14@16c.; poor, 13c.; factory, prime, 15c.; other, 11@14c.

CHEESE.—The market has reacted from the sharp advance of the previous week and closed dull and unsettled, with some little stock to be carried over. Exports for the week are 95,000 boxes.

Quotations are: State factory, fancy, 9c.; do. good to prime, 8¾@8¾c.; do. fair to good, 8@8¼c.; do. half skimmed, 5¾@6c.; Wisconsin factory, fine, at 8¼c.; do. good to prime, 7½@8c.; do. fair to good, 6½@7c.; Ohio factory, fine, 8@8¼c.; do. good to prime, 7@7¼c.; do. flat, fair to good, 6¼@7c.; do. poor to fair 5¾@6¼c.

Receipts for week, 110,800 boxes.
Exports, 84,000 do.
Liverpool cable, 61s.
Steam, 40s.

COTTON.—Has and active trade and prices closed strong. Latest prices are for July, 11.75@11.76c.; August, 11.03@11.03c.; September, 11.16c.; October, 10.56c.; November, 10.30@10.32c.; December, 10.31@10.32c.; January, 10.33@10.70.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.
Ordinary	8¼	8½	8¼
Strict ordinary	9	9¼	9⅛

STAINED.

Good ordinary	8¼	Low middling	9⅝
Strict good ordinary	9	Middling	9 11-16

DRIED FRUITS.—The general trade is slack and prices are nominal. Quotations are for

For North Carolina apples, fair to good, at 6½@7¼c.; choice, at 8@8¾c.; New York State quarters at 7¾@7¾c.; patent evaporated, in cases, choice at 14@14½c.; good and prime 13½@14c.; evaporated, sliced at ——c. Evaporated peeled peaches, good to choice, at 2@2½c.; North Carolina peeled choice 16@17c.; Georgia prime at 15@16c.; fair to good at 13@14c.; common at 10@12c.; unpeeled halves at ——c.; do. quarters at 6@6½c. Pitted cherries at 15@16c. Blackberries nominal. Raspberries at 28c. Plums at 17@17½c.

EGGS.—Receipts for week, 5,327 bbls.; do last week, 7,600 do. Prices have worked up under the continued small receipts. Business is steady and all stock is running down in quantity. Losses very large in count as the season has been exceptionally severe.

Near Points 16@17c.; State and Penn. 14½@15c. Western and Canadian fresh 13½c.; good, or ice house lots 12½@13c.

FLOUR.—The market has been advancing in sympathy with wheat, which has been affected by the unfavorable weather reports.

Latest prices are $3.40@4.15 for inferior to fancy superfine State and Western; $4.15@4.40 for ordinary to very good extra State, odd lots and lines; $4.40@4.75 for very good to fancy do.; $4.15@4.40 for ordinary to very good shipping extra Western, and $4.40@4.75 for good to fancy shipping extra do.; inferior to very good white wheat ——, $5.10@5.65; very good to very choice do. at $5.65@6.75; red and amber winter wheat, inferior to choice trade and family, at $4.90@5.25; round hoop Ohio, $4.35@4.85; and trade and family brands of do. at $4.90@6.25; St. Louis at $5.00@5.75 for inferior to good extra; $5.75@6.75 for good to very choice; Minnesota clear, very inferior to fancy, at $4.25@6.25; Minnesota "straight," very poor to very fancy, at $5.65@7.25, and patent inferior to fancy at $6.00@8.50; unsound stock at from $2.25@5.00; city mill extra at $5.00@6.75 for good to choice West Indies; do. for England, $4.25@4.65 for poor to very choice spring wheat, and $5.15@5.65 for winter wheat product; do. trade and family extras, $5.00@6.75; do. for south America, $5.75@6.00; No. 2 at $2.40@3.45 for poor to very fancy, the latter an extreme.

Receipts for week, flour, bbls. 67,819; corn meal, do. 570, wheat, bush. 1,913,100; corn, do. 1,638,200, oats, do. 197,950; rye, do. 10,000; malt, do. 116,775; rice, pkgs. 1,019.

Exports, flour 83,560 bbls.; corn meal, 2,800 bbls.; wheat 1,696,300 bush.; corn, 1,252,700 bush.; oats, 3,600 bush.; rye —— bush.; malt —— bush.; peas 1,460 bush.; rice 1,200 pkgs.

FRESH FRUITS.—There is now quite an array of orchard and bush produce and prices as a rule are good. Peaches are much of a feature already. Although this is an off year, advices from the main farms indicate a full yield. Operations for canning and preserving are said to be upon a larger scale than ever before. Georgia sends some of the showiest fruit ever seen in this market. The heaviest lots are Hines. The trade wants a better early peach than these. The Beatrice hardly fills the bill. A ventured opinion is that the far South will ultimately supply the growing New York want. Apples are in good demand with better size and quality. Pears not largely wanted; some good Southern specimens here. It is a good year for blackberries. Black caps not popular, when red raspberries are accessible.

Apples Sweet Rough ₱ bbl. $2.25@2.50; Sour $2.25@2.50; Md. Astrachan, per cr. $1@1.50; green 75c.@$1.25; Norfk, green ₱ bbl. $2@2.50; do. ₱ ½ bbl. 75c.@1.25. Peaches, Md. & Del. rivers, choice, ₱ cr. $3@3.50; Hale's & Beatrice, ice ₱ cr. $1@1.50; ₱ basket, 75c.@$1.20; N. C. prime ₱ bu. cr. $2.50@3; do. poor to good ₱ cr. $1@2; Ga. fancy ₱ 3 bu. cr. $2; common, ₱ 3 to bu. cr. $1@1.25. Pears, Clapp's Favorite, Southern, ₱ cr. $4@4.50, Virginia Southern $3.50@4; Manning's Elizabeth, Southern $3.50@4; Jargonelle, Southern, $3@3.50; Harvest, Jersey, ₱ bbl. $2@2.75 cooking, $2@2.50. Plums, Wilding, Md. & Del. ₱ qt. 1@1c.. Beach ₱ qt. 6@8c. Blackberries Lawton Jersey ₱ qt. 2@3c., Wilson, Md. & Del. 8@10c., Dorchester, 6@8c. Raspberries Red Antwerp up-river, 3-to-qt. cups 6@7c.; native up-river, 3@3½c.; Jersey 3@3½c.; Brandywine up-river 4@5c. Md. & Del. ₱ pint 6@7c. Black caps Jersey ₱ pint 3c. Whortleberries Shawangunk Mountain ₱ ½ bu. box $1.25@1.50; Jersey ₱ ½ bu. box $1@1.25; Md. & Del. ₱ qt. 6@8c. Currants cherry, ₱ lb 5@6c.; small ₱ lb 4@5c. black, 5@6c. white 4½@5c. Watermelons N. C. ₱ 100 $15@30; Ga., $25@40. Nutmeg melons, Norfolk ₱ bbl. $3.50@4.50. Hot-house grapes Black Hamburgh ₱ lb. 50@75c.; Sweet Water 25@35c. Peanuts continue quiet and unchanged. No hickory nuts offering; the last sale was at $1.10 for prime quality. Peanuts, Va. hand-picked, ₱ lb. 5½@5¾c.; extra prime 4¾@5c.; good to prime 4¼@4¾c.; shelled, 5½@5¾c.

GRAIN.—Wheat has shown a good deal of excitement and advancing prices through unfavorable crop reports and an active trade.

Latest sales are of No. 1 white at $1.17@1.18; do., July, at $1.15½@1.16; do., August, at $1.09¾@1.10¾; do., September, at $1.08¾@1.08¾; No. 2 white at $1.14½@1.15½; ungraded white at $1.10@1.18; No. 2 red at $1.23½@1.23; do., July, at $1.17@1.19¾; do. August, at $1.11½@1.12¾; do., September, at $1.10¾@1.11¾; ungraded red at $1.12@1.23; mixed Winter at $1.16½@1.18; No. 2 amber at $1.23@1.24; No. 2 Duluth, Milwaukee and hard spring, $1.13@1.14. Rye is firm at 75½@80c. for Western for August delivery. Corn is freely offered and is lower; latest sales are of New York No. 2, regular inspection, at 49@49½c.; do., July, at 48@49¼c.; do., August, at 49@49½c.; New York steamer mixed at 48c.; ungraded mixed Western at 47@50c.; No. 2 white at 53c. Oats are active; latest sales are of No. 1 white at 43c.; No. 2 white at 38¾@39c.; No. 3 white at 35¾c.; New York No. 1 at 36¾c.; New York No. 2 at 35@35½c.; do., July, at 35¾c. bid and 36¾c. asked; do., August, at 33¾c. bid and 33¾c. asked; No. 3 at 34@34½c.; ungraded white Western at 37@42c.; ungraded mixed Western at 35@37c.; white State at 40c.; mixed State at 35@36¾c.; No. 2 Chicago at 36¼c.

HAY AND STRAW.—There is a steady fair call for supplies and prices well maintained.

Shipping hay quoted at 75@80c.; retail lots at 85@90c. for medium, and 95c.@$1.10 for prime and fancy qualities; clover 65@70c. Straw at $1.05@1.10 for long rye, 60@65c. for short rye, and 55@60c. for oats.

Exports for week, 3,275 bales.

HOPS.—There is a slow market and prices unsettled and favoring buyers. Quotations are for

	Cents per lb.
New York, new crop, prime and choice	32 @35
New York, new crop, medium	30 @32
New York, new crop, low to fair	27 @29
Eastern, new crop	27 @35
Wisconsin, new crop	27 @35
Yearling	7 @18
Olds, all growths	4 @10
Pacific Coast, new	30 @35
Pacific Coast, olds (nominal)	5 @10

OIL CAKE.—Western is quoted at $32.50 per ton.

POULTRY AND GAME.—Dressed poultry has a good, steady demand and prices are strong with the present rates of receipts of prime. Western could be spared; it turns out poorly on arrival and is slow of sale.

Turkeys, choice, small, on ice, 12@13c.; fair to good, 10@12c.; Phila., dry-picked, 12@13c.; chickens, Spring, Phila., large, ₱ lb, 23@25c.; small, 22@23c.; scalded, 17@20c.; Fowls, Phila., dry-picked, 16c.; Jersey, good to prime, 14@15c.; State, dry-picked, prime, 14@15c.; State, scalded, prime, 13@14c.; Western, dry-picked, prime, 14c.; scalded, prime, 13c.; poor to fair, 10@12c; ducks, spring, dry-picked, large, 19@20c.; dry-picked, small, 17@18c.; State, scalded, 15@16c.; Phila., old dry-picked, 10@12c.; squabs, white, per doz.; $2@2.25; dark, $1@1.12.

Chickens are plenty and only good sizes show any firmness to prices. Prime fowls have a steady call from city killers. Tennessee poultry is in light supply this season, owing, dealers say, to the State tax upon collectors of coops and other small farm produce.

Chickens, Spring, large, ₱ lb., 18@19c.; small, 17@18c.; fowls, Jersey, 14c.; Western, 13½@14c.; Southern, 13@13½c.; roosters, old and young, 5@7c.; turkeys, mixed, Jersey, 11@12c.; Western, 10@11c.; ducks, N. J., N. Y. and Pa., ₱ pair, 60@70c.; Western, 45@55c.; Southern, 40@45c.; geese, Jersey, $1.50@1.75; N. Y. and Pa., $1.25@1.50; Western, mixed, $1@1.25; Southern, 87c.@$1.12; pigeons, 20@35c.

The market is almost bare of game. Woodcock not openly saleable until Aug. 1st, and shipments of Western are attended with risk. Eng. snipe, frozen, $2.50; stall-fed pigeons, $1.50@1.75; flight, 80c.@$1.

PROVISIONS—Have shown a liberal speculative trading and prices advancing, closing, however, weak. Latest prices are $12.55 for July, $12.20@12.35 for August, $12.50@12.90 for September, $13@13.05 for October, and $11.40 for sellers' option remainder of year. Bacon at 7¼c. for long clear and 7¾c. for short clear. Lard—Western steam at 7.20c. for spot lots, 7.15c. for July, 7.20c. for August and 7.27½c. for September. Stearine at 9¼@9¾c. for Western. Tallow at 6 3-16@6¾c. for prime. Beef—Extra India mess quoted at $17 for city; $10 for extra mess, and $9.50 for plain mess, $10.50@11 for packet, and $— for family mess. Beef hams at $21@21.50 for new.

Receipts for week, beef, 575 pkgs.; pork, 2,550 bbls.; cut meats, 28,100 pkgs.; lard, 19 200 pkgs.

Exports for week, beef, 1,945 pkgs.; pork, 5,900 bbls.; cut meats, 11,428,500 pounds; lard, 4,918,400 pounds.

TOBACCO.—The market has not varied for two or three weeks, with trade ruling very quiet.

VEGETABLES.—Old potatoes are dropped from the list. Some of the best remnants were taken for Havana at cheap prices. New are plenty; Norfolk now seldom compare with L. I. and N. J. The range is $1.50@3 for Va. and Md.; $2.35@3 for L. I. and N. J. Southern culls, 75c.@$1. Corn better. Tomatoes and a higher class of green stuff give the market for garden produce considerable life. Western onions will soon arrive and present rates will then drop. New York tomatoes run poor, hardly wanted.

Green corn, Hackensack, per 100, $1.@1.25; Burlington, 50@75c.; tomatoes, Norfolk, per cr., 75c.@$1.50; Maryland, per crate, $3@3.50; L. I. and Jersey, per bush., $4; cucumbers, L. I., ₱ 100, $1.50; cucumbers, Norf., ₱ bbl., $2@2.75; egg plant, Florida, prime, ₱ doz., $1@1.50; string beans, L. I. ₱ bag, $1.75@2.50; wax beans, L. I., $1.75@2.50; green peas, L. I., $2@2.50; turnips, Jersey, per 100 bunches, $3@4; Russia, ₱ bbl., $1.75; beets Jersey, per 100 bunches, $2.50@3; radishes, red, per 100 bunches, 50@75c.; black, $1.00@1.50; lettuce, ₱ bbl., $2@3; cabbage, Jersey, ₱ 100, $6; squash, Jersey, marrow, per bbl., $2@2.50; L. I., yellow, $2@2.25; L. I., white, $2@2.25; onions, Jersey, $5; Maryland, yellow, $5; Va., yellow, $4@5; carrots, ₱ 100 bunches, $1.50@2.

WOOL.—Trade has been very moderate, and prices have ruled a little unsettled, closing steady. Quotations are for:

Ohio, Pennsylvania and West Virginia washed fleece, XXX and picklock, 48@50c.; X and XX, 44@47c.; No. 1, 48@50c.; No. 2, 44@46; common, 40@42c.

N. Y. State, Michigan, Wisconsin and Indiana washed fleece—X and above, 42@44c.; No. 1, 46@48c.; No. 2, 42@44c.; common, 38@40c.

Illinois, Iowa and Missouri washed fleece, X and above, 40@42c.; No. 1, 44@46; No. 2 and common, 38@42c. Tub washed—superior, 48@50c.; average, 44@46c. Combing wool—Medium, washed, 50@53c.; medium, low, 45@47c.; Canada, 45@47c.; Kentucky, unwashed, 33@36c.

LIVE STOCK MARKETS

NEW YORK, Saturday, July 10, 1880.

BEEVES.—Receipts for week 11,825 head; do last week 15,684 do. Moderate receipts and fine quality have kept up a good movement during the week and though the closing droves did not run so well in quality the supply was quite sold up. Texan grassers sold at 5c., to dress 55 lbs.; Ohio and State grass cattle sold at 8¼@8¾c., to dress 55 lbs. A large portion of the sales were at 8@9¼c. for native steers, to dress 56 lb. Extra cattle sold in a few instances at 10@10¼c., to dress 57 lbs.

SWINE.—Receipts for week, 21,016 head; do last week 24,469 do. Stock still goes to packers; nominal rates $4.50@5 ₱ 100 lbs.; city dressed on change 6¼@6½c.

COWS AND CALVES.—Comparatively few head have arrived this week and prices for extra good milkers are firm. These are quoted $60@65 ₱ head; common to good $25@55, about old figures.

SHEEP AND LAMBS.—Receipts for week, 31,537 head; do last week 34,895 do. There was a fair demand for sheep and the offerings were about closed out at Thursday's prices; the feeling, however, was weak at the close and future prospects are not very flattering. Lambs were sold at about steady prices at Jersey City, but were ½c. lower than last Wednesday at 60th st. Sales of sheep were at 4@5¾c. of Southern and Western lambs at 5¾@6¾c.; of State and Jersey at 6¾@7½c.; and of Canada at $6.20@6.50.

VEAL CALVES.—Supplies seem to be limited and the market is strong for regular N. J. and some well-fed State.

Live calves, N. J. and Bucks Co., choice, 6¾c.; prime 5¾@6¼c.; State choice, 6@6¾c.; State, prime, 5¾@6c.; do., fair to good, 4½@5½c.; poor, 3½@4¼c.; Mt. Holly, good to prime, 5¾@6c.; buttermilk, 2½@3c.

DAY'S Kidney PAD

A CURE for the most prevalent and fatal diseases that afflict mankind FOUND AT LAST. Internal medicines never did nor never can cure KIDNEY DISEASE. STOP IT NOW: apply Day's Kidney Pad AT ONCE, and be cured of all affections of the Kidneys, Bladder and Urinary Organs. It is the only treatment that will cure NERVOUS AND PHYSICAL DEBILITY, and that distressing complaint, "BACKACHE." It will annually save many times its cost in medicines and plasters, which at best give but temporary relief. Sold by Druggists or sent by mail on receipt of price, $2. Our book, "How a Life Was Saved," giving a history of this new discovery and a large record of most remarkable cures, sent free. Write for it.

The Literary
Revolution.

The most successful revolution of the century, and to American readers of books, the most important. Only books of the highest class are published by us, and the prices are low beyond comparison with the cheapest books ever before issued. To illustrate and demonstrate these truths, we send the following books, all complete and unabridged, post-paid, at the prices named:

Macaulay's
Life of Frederick the Great. Former price, $1.25. Large brevier type, beautiful print: price three cents.

Carlyle's
Life of Robert Burns. Former price, $1.25. Large brevier type, beautiful print: price three cents.

Light of Asia,
By Edwin Arnold. Former price, $1.50. Beautiful print, brevier type: price five cents.

Thos. Hughes's
Manliness of Christ. Former price, $1.00. Beautiful print, brevier type; price three cents.

John Stuart Mills's
Chapter on Socialism. Essays of exceeding interest and importance. Price three cents.

Baron Munchausen.
His travels and Surprising Adventures. Former price $1.25. Bourgeoise type; price five cents.

Mary Queen of Scots'
Life, by Lamertine. Former price $1.25. Brevier type, beautiful print; price three cents.

Vicar of Wakefield.
by Oliver Goldsmith. Brevier type, beautiful print; price five cents.

Bunyan's Pilgrim's Progress.
Bourgeoise type, leaded; beautiful print; price six cents.

Private Theatricals.
By author of "Sparrowgrass Papers." Small Pica type, leaded; price two cents.

Stories and Ballads
For Young Folks, by Ellen Tracy Alden; with very fine illustrations. Selections complete from her book. Large type; price five cents.

Leaves from the Diary
Of an Old Lawyer. Short stories of thrilling, laughable, pathetic interest. Price three cents.

Booksellers
Everywhere (only one dealer in each town) keep these and our large list of standard books, which are selling by the million volumes, because the people believe in the Literary Revolution.

AMERICAN BOOK EXCHANGE,
Tribune Building, New York.

Reading for the Young.

TALK ON BOTANY.—NO. 4.

UNCLE MARK.

The Stem.

IN the preceding talks we have dwelt exclusively on the root, its forms and its mode of development, we will now advance a step farther and examine the stem of the plant, and try to understand some of the interesting features characteristic of its development. By way of review I will again call your attention to a few of the most prominent points in regard to roots. First, the office of the root is twofold, namely, to fix the plant to the earth or other supporting medium, and also to absorb nourishment for the plant. The absorption of plant food takes place through the little root-hairs, or fibrils, that form on the young and tender rootlets. These fibrils are generally too fine to be seen with the naked eye, but they can be distinctly seen under a lens of moderate magnifying power. They consist of closed cells with very thin walls through which the food is imbibed, and all plant food must therefore be in a liquid state; it cannot enter the plant in solid particles, no matter how small these may be. Remember also the mode of growth of the root. It lengthens by the addition of cell tissue at the tip, so that any portion of it once fixed in the ground is not again pushed out of position by growth.

The stem is the ascending axis of the plant. In a former lesson we learned that the seed-leaves or *cotyledons*, are already formed in the seed, and that when the embryo bursts the seed-coats, and stretches itself into the air and sunlight the cotyledons often become green and partake of the nature of true leaves. Snugly hidden away between this first pair of leaves is a little bud called the *plumule* and it is from this bud that the future stem of the plant is developed.

Unlike the root which only grows at the tip, the little primary stem lengthens throughout its whole length and usually lifts the cotyledons above the surface of the earth. When the growth of this little stem bearing the seed-leaves is completed the plumule begins to grow forming another piece of stem crowned with one or two leaves. When this piece of stem is developed the bud in the joint of the last new leaf starts upward forming another piece of stem and another leaf, and so on as long as the tree continues to grow. As soon as true leaves are formed the young plant has all the organs necessary to growth that are found in a full grown tree. It has roots, leaves and stem, and the power to draw the needful materials for its growth from the soil and air.

Nodes.

The leaves appear at certain regular intervals on the stem called *nodes*. These points where the leaves occur have received the technical name of *nodes*, literally *knots*, because the stem is at these places more or less thickened, hardened or otherwise interrupted in its tissue. This is conspicuously seen in the stalks of corn or all other kinds of grass, in which each joint form a node, or place where the leaf appears. On the twigs of a tree the nodes are also readily seen, even after the leaves have fallen, by the scars that are left; but the woody tissue is not generally much harder than at other points and as the twigs grow and become thickened branches, the scars are obliterated and the nodes disappear. I now wish each of my little readers will take a twig of a maple with leaves in the hand for examination, and also one of an apple tree, or elm, or beech, or willow. You will notice that on the apple twig there is one leaf at each node. When thus arranged the leaves are said to be *alternate* because they alternate with each other in their disposition about the stem. On the maple twig you find two leaves placed opposite each other at each node, the leaves are therefore said to be *opposite*. Still other plants have three or more leaves at a node, and when this is the case the leaves are said to be *whorled*.

Internodes.

The smooth portions or spaces of the stem between the nodes are called *internodes*. You will see that the length or these internodes will determine how thickly the stem is clothed with leaves. If the internodes are very short the leaves will be thickly set, if, on the other hand, they are long there will be comparatively few leaves on the stem.

Phytons.

Now, if you take a knife and cut the twig in pieces just above each leaf, you will get a number of parts that are very much alike each consisting of an internode with a node on its upper end. Each such part, that is, an internode with its node, is called a *phyton*. All herbs, shrubs and trees are really constructed of phytons, one placed on top of another.

But more about this in our next talk.

ORATORICAL SUCCESS.

THE purpose of a great speech is to persuade men. It may be brilliant and eloquent, so much so that men will say of it, "that is oratory," and go about their business. When men act as if they had heard not a word of a speech, it is a failure, even if it is thought worthy of a place among "specimens of eloquence."

"A great speech," said O'Connell, speaking of addresses to a jury, "is a very fine thing; but, after all, the verdict is *the* thing."

Professor Mathews insists that no one would discover the perfect orator, if such there could be, while he was speaking. He tells two anecdotes to illustrate his assertion.

When Chief Justice Parsons, of Massachusetts, was practising at the bar, a farmer, who had often heard him speak, was asked what sort of a pleader he was?

"Oh, he is a good lawyer and an excellent counsellor, but a poor pleader," was the reply.

"But does he not win most of his cases?"

"Yes, but that's because he knows the law, and can argue well; but he's *no orator*.

A hard-headed bank president once congratulated himself, in the presence of Mr. Mathews, on resisting, as foreman of a jury, the oratorical blandishments of Mr. Choate.

"Knowing his skill," said the hard-headed man, "in making white appear black, and black white, I made up my mind at the outset that he should not fool me. He tried all his arts, but it was of no use; I just decided according to the law and evidence."

"Of course," answered Mr. Mathews, "you gave your verdict against Mr. Choate's client?"

"Why, no; we gave a verdict for his client; but then we couldn't help it; he had the law and the evidence on his side."

It never occurred to the bank president or to the farmer that Choate and Parsons were after verdicts, not admiration. And they got them because they sunk the orator *into* the advocate.

"Thou madest people say, 'How well he speaks!'" said Demosthenes to Cicero, in Fenelon's "Dialogue of the Dead," "but I made them say, 'Let us march against Philip!'"

That was true, but it required many passionate appeals from the prince of orators, before the Athenians uttered that cry.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I sit down to try my luck again. My last letter did not appear in print, but I am far from being discouraged. We received the Free Seed Distribution seeds, but not the raspberry. I got all but the oats. I planted all, but none of them came up, except the Golden Ovoid mangel, some of which are nearly three inches thick. Now for the cousins' Free Seed Distribution. The pinks I planted on the first day of May. Sixty-three plants came up. I didn't set them out till the first week in June, and by that time there were only 48 plants. They have not grown much in hight since that time. The portulacas and phlox did not come up very well, only six of the former and ten of the latter. The okra came up well. Out of six seeds five came up; one was a little late, and I scratched into the earth to see if it was sprouting and broke it off. The weather was cold and wet, and two of them rotted off at the ground, and one was hoed off for a weed, so there are only two left. One is ten inches and the other eight inches high, and both have buds. About half of the mignonette came up. It has been blooming for about a week; it is not showy, but very sweet-scented. I gave four of the melon seeds away, and I planted the remainder in four hills. The chickens scratched two of the hills away; I hoed them up again and two plants came up in one of them, but the other was left blank. After thinning out, I have eight fine plants, all in bloom. The way I made the hills is thus: After the ground was pulverized to the depth of about eight inches, I hoed out holes about two feet square and six inches deep. I filled these holes nearly full with manure, then pulled the dirt back, and planted the seed on the top of this.

We are done harvesting here, and most of the wheat is hauled in. I think that Virgil C. Mitchell's poetry is good for one of her age. My letter is long enough, so I will bring it to a close; if I don't that dreaded waste basket will receive it. If I see this letter in print—life and health spared—I will write again. With my love to all the cousins, I say, good-bye. SAMUEL P. SHULL.

Clark Co., Ohio.

DEAR UNCLE MARK:—Being a Canadian, I am, perhaps an intruder on your Horticultural Club. However, I will cross the line and join it. Why, this is equal to scaling the fence of my neighbor's garden and helping myself to vegetables he was at that moment tending. But just when I am about to chide myself for my impertinence, I find that the garden does not belong to my neighbor at all, but to all who wish to take beauties out of it for simply telling their names to the anxious-faced old man by the gate, who smiles on the industrious groups that are elbow deep in gardening for the gratification of seeing him smile on them. Anon he listens for the tap of a child's soft hand that he may admit the little one, and keep the little fingers from becoming entangled in the meshes set for the idle. Dear Uncle Mark loves God and he could not suffer Him to lose one of his tender lambs, if his garden could contain them all. He has a warm hand to press each chubby one that is extended to him. He teaches the young hands to separate the weeds from the flowers. Surely, when Uncle Mark swings his gate open to so many of his own, he will not turn out through it, the stranger who scaled the fence, but give her a hoe and a word of encouragement and allow her to be one of the great many who are beginning to learn that the only way to enjoy life is to be useful. Before my feeble voice rises too high in favor of the design of Uncle Mark in promoting the work of the Horticultural Club, I will bid you all adieu. SHELUMIEL.

[Shelumiel, take your hoe and go to work. Our club may contain one million members. The amount of fruit that each one may gather is only limited by the industry and care with which he or she keeps out the weeds, and tends the useful plants.—U. M.]

DEAR COUSINS:—Hurrah for the country! I am going to the contry pretty soon. And won't I have fun, though? Why don't Frizzle-Top and Madcap Mollie send some letters? Their letters are the only ones that are not sleepy. I cannot keep my letters from getting sleepy to save my life. I must say I am the most unlucky girl in trying to raise flowers I ever heard of. When my seeds came from the RURAL I planted them along with some other seeds I had bought; but not one of them came up. I am sure I don't know why. Well, after I had got tired of waiting for those seeds to grow up, I got some more, and they are coming up now. I have read so much lately that I began to get sick from it, and mamma made me stop for a little while. I am trying to learn a little bit of the French language; but it is rather hard work in hot weather. I think I shall begin to take music lessons in a little while; so you see I will have to study quite hard. I am dreadfully unlucky, and I am continually getting into scrapes. I am very fond of playing tricks; but I do think it is a disagreeable thing to get caught. The other day, in school, when we were out in the large room writing, I gave a girl a pinch, and she fairly jumped up in the air. Well, Miss Burger, my teacher, saw it and brought me out to stand in the middle of the room. The principal saw me and asked what was the matter. When she learned she made me sit on the platform all the afternoon, and I did not enjoy it a bit I can assure you. Well, I guess I must bid you good-bye.

Your sorrowful cousin.

New York. LIZZIE E. BLAIR.

DEAR UNCLE MARK AND RURAL COUSINS:—Will you admit another cousin into your circle? I have been reading your letters a great while, and like them very much. Papa has been taking your paper three years, and think it is splendid. I am going to school now. We have a beautiful farm about three miles from town, and any amount of roses and honeysuckles. We have garden flowers and a few house plants. Am I too late to join the Horticultural Club? I like that story entitled "John Ascott's Daughter." I will try and write you one some time. Will some of the cousins please send a pattern for fancy tatting through the RURAL to me. I can tat real nice. I am crocheting a rug with a flower-pot on it. I think it will look real nice. I am going to can some fruit next week, such as gooseberries, strawberries, etc. I will tell you about our luck in raising poultry this year. We have sixty little chickens, doing finely, but our little goslings, oh, dear! they were so nice and pert; but they all died. The old goose would lead them down to the slough and they would get wet and chill to death. We tried to raise two in the house, but failed. We have five more eggs, and hope to have better luck with them. Grain looks nice out here. I think we will have a fine crop this year. But I must close. If I see this in print I will let you hear from me often.

From your cousin, E. A. C.

Shedds, Linn Co., Oregon.

Youth and its happiness flown.
I have tried to suffer and be strong,
But the lesson was hard to learn."

ANSWER TO GEOGRAPHICAL ENIGMA, JUNE 19th.—Faint heart never won fair lady.

Various.

BRIEFLETS.

The following is old but good advice: Keep the head cool while in the harvest field. A leaf of rhubarb, cabbage, beet, or even corn will greatly assist. Thus sun-strokes may be avolded. . . . . The editor of the Tribune regrets his inability to inform an inquirer why grass colors butter yellow instead of green. . . . . It appears from careful tests made in Germany that an intact skin is one thing to be looked to in the preservation of pears and apples. . . . . J. M. Gregory, president of the Illinois Industrial University, has resigned. . . . . Men who wish to be accredited with superior wisdom and to occupy a high position in the world—to merit and to hold it—must possess superior knowledge. The grand trouble is that pretenders on all occasions are thrusting themselves forward in the hopes of appropriating the harvest they never sowed, cultivated or garnered. . . . . Mr. Roe says, in his new work, p. 94, "The ovule in the ovarium to which the stigma leads represents, at maturity, a seed—the actual fruit of the strawberry." It would have been more accurate (botanically) had he expressed it thus: "The ovule in the ovarium to which the stigma leads, represents at maturity the actual fruit of the strawberry which contains the seed.' . . . . . Mr. J. J. Thomas finds that manure and too rank growth are detrimental to the quality of the Clairgeau pear as he has found it more uniformly good on old and slower-growing trees. . . . . When the buds are plump and the bark may be easily separated from the wood—then is the time to *bud*. . . . . Too little care is given the first season to grape-vines. One shoot is enough. Pinch out all the buds that push in the axils of the leaves. That is, confine the vine strictly to *one* cane. Tie it to the stake or arbor whenever 18 inches of growth have been made. This is more important than it seems. Of two grape-vines, one of which is well supported, the other not—it will be found that the former will make a much stronger growth and fruit perhaps a year earlier. . . . . We shall have some highly important asparagus notes ere long. . . . . And we shall soon clear up the mystery that invests the "WHITE ELEPHANT." . . . . . Beans and cucumbers for pickles—melons for mangoes may still be planted. . . . . It will save time and labor if purslane is *pulled* up as soon as it appears. If hoed the cut pieces will root, that remain in contact with the soil. Then if permitted to bloom and seed, a hundred plants may grow from the seed of a single pod. If with any weeds it pays to destroy them before they appear, it certainly pays with "pussley." . . . . Col. Weld hazards the prediction that before long more eggs will be hatched by kerosene than under hens. . . . . Will somebody please inform us why a young lady who modestly shrinks from sitting on the front stoop with a young man's arm encircling her waist, will whirl around a brilliantly lighted ball-room for hours at a time and let a fellow hug her to his heart's content?—Elmira Sunday News. . . . . The editors of the Nebraska Farmer have built several miles of wire fence the past month and they deem it as good as any post-and-rail fence though it costs but 43 cents per rod—three wires. . . . . .

THE 49TH EXHIBITION OF THE AMERICAN INSTITUTE of this city will open on Sept. 15, and close on Nov. 27, next. The Board of Managers desiring to encourage, so far as in their power lies, a full and complete exhibit of work produced by Amateurs and Apprentices in all branches of Mechanical, Industrial and Decorative Art: it is therefore proposed to admit, without charge, for exhibition and competition, all such works as may be approved and to award premiums to those who may excel in the arts named. Applications for space must be made before September 1st, to the General Superintendent, Room 22, Cooper Union, New York City, stating nature of proposed exhibit, and where it may be seen and examined. The Board of Managers reserve the right to reject any exhibit offered, which in their opinion may not be worthy of a place in the exhibition.

CATALOGUES, ETC., RECEIVED.

THIRTY-NINTH ANNUAL REPORT of the New York State Agricultural Society for the year 1879. This compilation of 130 pages, 8 vo., contains among other matters, a valuable address on Lung Plague or Pleuro pneumonia, by Prof. James Law. Reports on Insects Injurious to Vegetation by J. A. Lintner; Poultry Breeding by Natural and Artificial Means, by our contributor, A. M. Halstead; and About Potatoes, by I. F. Tillinghast. Thomas L. Harrison, Sec'y.

CIRCULAR. American Association for the Advancement of Science. Twenty-ninth meeting, to be held at Boston, Mass., Aug. 1880. Address F. W. Putnam, Sec., Salem, Mass.

PERSONAL ITEMS.

Gen Grant is receiving ovations in New Mexico

General Ord, it is reported, will take a year's furlough and then he retired, General Schofield succeeding him in Texas.

Congressman De La Matyr has been married to a widow at Friendship, N. Y. They were engaged in youth, but quarreled and separated.

Ulysses S. Grant, Jr. will be married to Miss Jennie Flood, a daughter of the San Francisco millionaire, about the middle of next November.

The young duke of Portland, as soon as he came into possession of his property, settled £100,000 on each of his half-brothers and £6,000 a year on his stepmother.

Dr. H. S. Tanner, a Minnesota genius, is demonstrating in this city his ability to remain 40 days absolutely without food, except a very little water. At this writing he has fasted 12 days, being constantly and carefully watched by doctors. He seems lively and hopeful of success.

Gladstone says he was never better in health than now. He certainly never worked harder. He sits through debates night after night and is constantly ready to answer criticism or requests for information. And he is always at work with pen and paper on the Treasury bench. He is in high spirits and looking extremely well.

MR. JOS. H. DENSON, Clerk and Recorder of Sevier County, Arkansas, says in a recent letter: "I have forgotten whether I wrote you concerning *the almost marvelous effect* the Compound Oxygen Treatment had on me. I was suffering from Bronchitis, and had been for three months—had almost despaired of recovery—when I commenced the Treatment. I could feel a marked change on the first night I took it. I had not enjoyed a good night's rest for something over three months; but on the night I first took the Treatment I slept splendidly, and afterwards continued to improve rapidly until I was cured. If you see fit you can use this for the benefit of sufferers." Full information about this new Treatment for Chronic Diseases, sent free by Drs. STARKEY & PALEN, 1109 and 1111 Girard St., Phila., Pa.

Miscellaneous.

XX COT (not painted, White Duck) $2.

Makes a perfect bed. No mattress or pillows required. Better than a hammock, as it fits the body as pleasantly, and lies *straight*. Folded or opened instantly. Self-fastening. It is just the thing for hotels, offices, cottages, camp-meetings, sportsmen, etc. Good for the lawn, piazza, or "coolest place in the house." Splendid for invalids or children. Sent on receipt of price, or C. O. D. For **50 cents extra**, with order, I will prepay expressage to any railroad station east of Mississippi River and north of Macon and Dixon's Line. For **75 cts.** in Minnesota, Missouri and Iowa.

The Monitor Jr. is the most perfect Clover Thresher, Separator, Huller and Cleaner in the world. The Threshing and Hulling Cylinders run under-shot. They also continue to manufacture the old "Monitor," with *Threshing* and *Hulling* Cylinders running *over-shot*. Send for price list, terms, and descriptive catalogue. Address as above, and say you saw this in the RURAL NEW-YORKER.

MINNESOTA CHIEF!

The Best Thresher on Wheels!

It is not a vibrator, neither is it an apron machine, but the best points of both are combined, with new and original features of its own. It is wonderfully simple in its arrangement. It is admirably perfect in its threshing and separating qualities. It saves all the grain, and cleans it ready for market. It runs easily, is constructed durably, is finished beautifully, is the most economical, least expensive, and altogether the most satisfactory machine in the market.

It will handle wet grain as well as dry. In threshing Flax and Timothy it has no equal, threshing and cleaning both as well, and nearly as rapidly, as wheat, and requires no change except the sieves. It has more square feet of separating and cleaning surface than any other machine made, and cannot be overloaded. It is both over and under blast at the same time.

Our clover hulling attachment is a new and very desirable feature. It does the business more rapidly and better than an exclusively clover hulling machine.

Separators of the various sizes fitted for Steam or Horse-Power, as desired.

An Improved Pitts Power, an Improved Woodbury Power, and the Elward Equalizing Power, all mounted on four wheels, are manufactured by us, and are not surpassed by any in the market.

Miscellaneous.

DURING JULY ONLY!

During the month of July subscriptions will be received for the **CHICAGO WEEKLY NEWS**, extending from the date of receipt to January 1st next for **TWENTY-FIVE CENTS.** The **CHICAGO WEEKLY NEWS** is a large 32-column paper, edited with special reference to the needs of the family circle. It is especially complete as a *news* paper, every issue presenting complete telegraphic reports of all important happenings the world over. Its **Chicago Market Quotations** are full and trustworthy. It is **Independent in Politics**, giving all political intelligence free from partisan coloring, and discussing political questions without fear or favor as to parties. Condensed notes on **Art, Literature, Science, Industries, Fashions,** etc., and **SIX COMPLETED STORIES** in every issue. It is the cheapest metropolitan weekly published in the United States, costing only **SEVENTY-FIVE CENTS A YEAR.**

To afford all desiring it an opportunity of becoming acquainted with the character of the **CHICAGO WEEKLY NEWS** before subscribing for a year, we make this special offer for the **MONTH OF JULY ONLY** of sending this paper from date to January 1st next for the nominal price of **TWENTY-FIVE CENTS.**

NOTICE—That this special subscription term includes the entire Presidential Campaign and extends two months beyond—to Jan. 1, 1881.

A 25c coin may be safely sent in a strong envelope. A club of five subscriptions for a One Dollar Bill. Address, **VICTOR F. LAWSON, Publisher, 123 Fifth Avenue, Chicago, Ill.**

Trade **LONDON PURPLE.** Mark

Valuable insecticide for the extermination of the COLORADO BEETLE, COTTON WORM and CANKER WORM. For Prices, Circulars and opinions write,
HEMINGWAY'S LONDON PURPLE COMPANY, (Limited) 90 Water St., New York.

Professor C. V. Riley says: London Purple can be more effectually sprinkled or sprayed on to the plant than Paris-green, by virtue of its greater fineness.
Professor C. E. Bessey says: It promises to be a most excellent remedy. It quickly kills both the Larva and the Winged Insects.
Professor J. L. Budd says: A single application placed every one of the pests on their backs over the ground either dead or in a dying condition, in less than six hours.

Implements and Machinery.

CORTLAND WAGON COMPANY,

Manufacturers of Platform Spring Wagons, Open and Top Buggies, Business and Road Wagons. Humorous.

"Now, tell me candidly, are you guilty?" asked a lawyer of his client. "Why, do you suppose I'd be fool enough to hire you if I was innocent."

SOME predict that the time will come when people can read each others thoughts like a book. It is sad to think that many fly-leaves will be discovered where least expected.

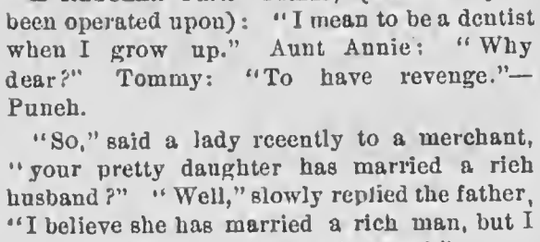
"SIT down!" said a nervous old gentleman to his son, who was making too much noise. "I won't do it," was the impudent answer. "Well, then, stand up. I will be obeyed!"

A REGULAR Turk—Tommy (who has just been operated upon): "I mean to be a dentist when I grow up." Aunt Annie: "Why dear?" Tommy: "To have revenge."—Punch.

"So," said a lady recently to a merchant, "your pretty daughter has married a rich husband?" "Well," slowly replied the father, "I believe she has married a rich man, but I understand he is a very poor husband."

Yellow is not Attractive

When displayed in the human countenance, and indicates a condition of the liver which, if not altered by timely medication, will assuredly produce most disastrous results. Jaundice, congestion and hepatic abscess are among the consequences to be apprehended from a neglect to reform a bilious habit, and a general derangement of the vital functions is always consequent upon a prolonged attack of liver complaint. The most reliable as well as most popular remedy for biliousness, as well as the maladies which usually accompany it, constipation and dyspepsia, is Hostetter's Stomach Bitters, a botanic medicine of perfect purity and unexceptionable quality. It relieves the bowels when obstructed, gently but effectively, re-establishes digestion, improves the appetite, and tranquilizes and invigorates the nervous system.



Metallic Shingles.

Make the most durable and ornamental roofs in the world. One-fourth the weight of slate, and will not break from any cause; cannot blow off, and are absolutely tight. Send for descriptive circular and reduced prices to

IRON CLAD MF'G CO.,
22 Cliff St., New York.

Young Lady.—"Why, James, you're spoiling that Hedge!"

Gardener.—"Ah! Tummas Lapham he come along this mornin', an' he says to I, says he,—'Why, James, thee beist a spilin' that Hedge!'—'Thee beist a big loiar,' says I, 'Tummas! The more thee do trackle an' eut common Hedges, the better they be!'"

C. GILBERT'S STARCHES

ARE ABSOLUTELY PURE.

Chambers's Encyclopædia.

15 Vols. Over 13,000 Pages. Price During July, $6.25.

Among the wonderful things which have been accomplished for lovers of good books by the "Literary Revolution," perhaps the most wonderful is the reproduction of this great Encyclopædia at a merely nominal cost.

It is a verbatim reprint of the last English edition, in 15 beautiful volumes, clear nonpareil type, handsomely bound in cloth, for **$7.50**; the same printed on finer, heavier paper, wide margins, and bound in half Russia, gilt top, price **$15.00**. The first ten volumes are ready for delivery. Vol. 11 will be ready July 10. The remaining volumes will be completed by October next.

$6.25. An Amazing Offer. $6.25.

The more widely and rapidly these volumes are scattered, the greater is their influence in inducing other purchasers of this and our many standard publications. Accordingly we give special terms to early subscribers.

To all whose orders and money are received during the month of July, we will supply the 15 volumes, in cloth, for **$6.25**, and in half Russia, gilt top, for **$12.50**. To any one sending from any place, where we have no special agent (usually the leading bookseller of the town), a club of five orders, we will allow a commission of 10 per cent. The volumes issued will be sent at once by express, and the remaining volumes when completed.

A specimen volume in cloth will be sent, post-paid, for **50 cents**, or in half Russia, gilt top, for **$1.00**, and may be returned at once, if not satisfactory.

The "CHAMBERS'S ENCYCLOPÆDIA" comprises the first 15 volumes of our "Library of Universal Knowledge," and the remaining volumes, complete in themselves, will be sold separately when published.

Standard Books.

Library of Universal Knowledge, 21 vols., **$10.50.**
Milman's Gibbon's Rome, 5 vols., **$2.50.**
Macaulay's History of England, 3 vols., **$1.50.**
Macaulay's Life and Letters, **50 cents.**
Macaulay's Essays and Poems, 3 vols., **$1.80.**
Chamber's Cyclopædia of Eng. Literature, 4 vols., **$2.**
Knight's History of England, 4 vols., **$3.**
Plutarch's Lives of Illustrious Men, 3 vols., **$1.50.**

Rural Architecture.

A FIRST-CLASS FARM-HOUSE.

THE architectural illustrations given in this issue, are those of a farm-house recently erected in Grafton, Massachusetts. The design is in a somewhat modified Gothic style. Figure 236, represents the front elevation. As will be seen it consists of three stories, the attic or third floor being lighted with dormer windows. The building is more ornamental than is generally the case with farm-houses. On the first floor are two bay-windows at the front, one on each side of the spacious piazza. This arrangement gives a certain cozy and retired aspect to the entrance, which has a very pleasing effect. The bay-window on the left in the engraving, is reproduced also in the second story, and directly above this in the third story is a finished balcony. This feature prevents the plainness and monotony that are inseparable from bare, straight walls, and gives an uncommonly lively tone to the structure. The roof is finished in a deck and ornamented with finial and iron cresting.

We give the plan of the first floor, figure 237, in connection with the front elevation. From this it will be seen that there is a spacious hall, (9x29 feet) running through the center of the house, giving abundant opportunity for ventilation in warm weather. On either side of this are arranged the four main rooms on this floor, the dining-room and kitchen on the right, separated by a large pantry, and the parlor and sitting-room on the left. The L, or rear wing of the house, is occupied by wash-room, milk-room, store-room and refrigerators, and all the appointments of a well-appointed modern farm-house.

From the plan of this floor a very good idea can be obtained of the arrangement on the second floor, of which no plan is given. There are four chambers, each about 14x14½ feet, respectively over the four rooms below, and each having a spacious closet. The chamber to the left, over the parlor, is somewhat larger than the others, and has a bay-window, as seen in the elevation. It may be called a family chamber, and connected with it, immediately over the front part of the hall below, is a small room, 9x9 feet which may be used as a sewing-room or a childrens' chamber. In the L, which is continued up throught all three stories, are the bath-room and another chamber, 12x16 feet, and back stairs leading from the kitchen floor.

The attic floor is so arranged as to give good hight to the ceilings, and can be cut up into very commodious rooms for servants, guests, or for members of the family.

The structure is estimated to cost from $6,000 to $8,000, according to the degree of finish bestowed upon it. A house so spacious, convenient and ornamental, must, of course, be costly in proportion to its advantages.

This original plan is furnished us by Bicknell and Comstock, 194 Broadway, New York, who will supply any particulars desired beyond those we have given.

WESTERN FARMING.—IX.

W. I. CHAMBERLAIN.

Artificial Fruiting.

IT has long been a question whether the "bearing" year of fruit trees could be changed and controlled, and whether trees late in coming to bearing could be artificially fruited. These are two distinct questions, and it has been supposed that distinct and different means must be employed to secure each result. Late fruiting or prolonged barrenness, especially in apple or pear trees, has usually been the result of over-growth of limb, *i. e.*, too rapid wood-making, and it has long been noticed that anything that checked this growth one year would fruit the tree the next. This occurs when the tree is wounded, when mice or rabbits girdle it, and often when a tree or orchard which has been under cultivation with low hoed crops is seeded to Timothy and the wood-growth greatly checked. But girdling has always been deemed a blow at the life of the tree. Mice and rabbits have been deemed pests, as they are, and the malicious girdling of fruit trees by the hand of man is a penitentiary offence, and has recently, in my own town in Ohio, been visited with the full penalty of the law. Fruiting in the barren year, too, has been secured by the laborious process of bud-picking, but this mode is entirely impracticable in large orchards.

Great was my surprise, therefore, a few days since, in visiting the extensive and splendid nurseries and orchards of J. B. Spaulding & Co., of Springfield, Ill., to find abundant and healthy fruiting produced at will in any tree or hundred trees, or miscellaneous and arbitrary selection of trees of any age—produced, too, without failure in a single instance, without damage to the tree, and in an exceedingly easy and simple way—in fact the very way suggested by the mice.

In connection with their extensive nurseries (of which I cannot now speak, though they are the premium nurseries of Illinois, and in many respects the best in the land) the Messrs. Spaulding & Co. have some 14,000 apple trees set out in orchards, and of various ages. They are set fifteen feet apart each way, the intention being in time to take out every other row, and then every other tree in each alternate row. Hence the life of three-quarters of these trees is of no great value, and Mr. Spaulding has used them freely in his various experiments. He started more than five years ago with the theory that the moderate girdling or disbarking of trees of rampant growth at *the proper time of year* would check the wood-growth, form fruit spurs for next year, and not injure or shorten the life of the tree. The first part of this belief was accepted long since by many pomologists, including Chas. Downing; but the last part, viz: that it would not injure the tree or endanger its life, was entirely, and even indignantly, denied by all. But Mr. Spaulding's experiments have been thorough, numerous, varied, and accurate, and, to his mind, and the minds of all who examine the results, establish beyond doubt or question the great value of his discovery (for such in reality it is) to the Western orchardist. His work is of two kinds, "ringing" and "girdling" or "disbarking." In the case of a tree of moderate growth the "ringing" is practiced; that is, the knife is drawn firmly around the trunk, just below the limbs, cutting the tree clean to the hard wood. This checks the growth moderately, and starts the fruit buds or spurs for *next year's* fruit crop. This work is done in May or June, *while the sap is flowing freely.* If the tree has a rampant growth, as trees on the rich soil of Illinois are apt to have, a ring of bark is removed entirely around the tree to the width of a quarter to half an inch.

I saw several thousand trees, of various ages and sizes, on which one or the other of these methods had been practiced, and in every case with complete success. There was in every case a fine setting of thrifty fruit, well developed, and already ripe in the case of the early varieties, and in no case did the tree seem to be injured. The bark in a few weeks completely closes over the wood from which it has been taken, so as hardly to leave a scar, and the *next year* the tree bears fruit in abundance.

Mr. Spaulding has such confidence in the vitality of the trees that he has removed the bark clear around the tree for a distance even of twelve inches, to see if it would kill the tree. I saw such trees, girdled ten days before, on which a film of new, green bark was rapidly forming already. But, of course, this is simply experiment. All that is needed is a ring from a quarter to half an inch in width, and I saw abundant evidence that girdling to this width, even for several years, does not injure or threaten the life of apple trees, at least where they have thrifty, luxuriant growth. Whether it will do for the slow-growing trees on light soils or on heavy clay soils, I cannot tell. But for the rich soils of Illinois, where the tendency is to over-growth of body and limb and slowness in fruiting, this discovery of Mr. Spaulding seems to me to be a valuable one. There is no patent on it, and I have his full permission to call attention to it.

The reason this girdling does not kill the tree, like that done by mice and rabbits, seems to be because it is done during the time *of most*

vigorous growth, and a film of sap is immediately thrown across the exposed wood of the tree and the new bark begins to form. But mice and rabbits girdle in Winter, and the wood becomes dry before the sap begins to flow, and, of course, the tree dies. The matter seems to me to be worthy of careful attention and experiment by pomologists, under all the varying conditions of soil, climate, variety and environment.

[We have been trying the same experiment, in a modified form, upon Blount's corn, the results of which we shall, of course, present to our readers in due time.—Eds.]

Arboricultural.

TREES THE WANT OF THE GREAT WEST.

PROFESSOR ELBRIDGE GALE.

THE "Great American Desert" is now teeming with a vast population. The sun shines on no more beautiful land. A deeper or richer soil cannot be found. But experience has taught us that this whole region so inappropriately called by our old geographers "The Desert," is subject to extraordinary climatic extremes. Droughts and floods in irregular but certain succession seem, from the experience of 25 years, to be the normal condition of things here. The seamed and gullied uplands everywhere show the foot-prints of past storms and floods. The timber growing wherever it could find protection from the annual fires, gives in the measure of its annual rings of wood growth a wonderful history of climatic extremes, telling of years of famine and years of plenty, for 200 or more years. All this teaches us that as periods of drought and flood have alternated in the past, we should be prepared for a like condition of things in the future.

Our people have sought to ignore the obvious facts in the case. Encouraged by the cry that the plow will soon redeem the treeless plains, thousands have rushed on to the frontier, hoping there to reap the reward of toil in prosperous homes. But to-day they turn their faces towards their old homes, or come to their Eastern neighbors asking bread for themselves and their little ones. The truth is simply this: their crop last year was almost a total failure, and they will reap at best only a scanty harvest this year. Many must have help or suffer. Some will leave their lands; others will try to stay. Their all is at stake. They have come here under the pressure of a theory, extensively advertised, that by their own work they would be able to immediately modify the climatic conditions, and secure a greater regularity of rainfall. A great wrong has been inflicted on these people. As they beg for bread, or move slowly and sadly back to more Eastern homes, at the sacrifice of their all, they appear as the martyrs to a theory as false as it is fatal—that the plow alone will materially change the climatic conditions of the Great West.

The sad experience of 1879 and 1880 so far has taught us that no more dangerous doctrine has ever been promulgated with reference to the great plains. It has proved to thousands a snare and a delusion, and as a consequence they come to their more eastern neighbors asking bread. The theory may be a very nice one, and a very popular one with those who write advertising letters from Eastern cities on the climate of Kansas, but to the frontier settlers it "pans out" no gold. There is no question that the plow must go first, but tree culture must follow. The writer has seen within the past few weeks great fields of corn cut up and almost ruined by the driving winds and shifting sands. He has seen young orchards standing in great sand drifts, hedges half-buried by fine dust from the plowed fields, and many acres of broken prairie left uncultivated because of the manifest disposition of the soil to take to itself wings. This was the work of the plow alone, and each year in the future with like culture the result will be more fatal.

But he saw also alongside of this ruin, and under a very slight protection, vineyards loaded with grapes, peach, apple, cherry trees and various kinds of small fruits growing in great luxuriance. Under the same protection he saw fine fields of wheat, corn and garden vegetables that could hardly be surpassed anywhere. Here there was no drifting soil, while one quarter of a mile away the young trees were standing in banks of drifting sand.

A late writer says "We have heard a great deal said about the power of trees to bring rain, but surely it was not trees that changed the meteorology of Western Kansas." No it was not, nor was it anything else. The sad experiences of both the last and the current year prove past all doubt that the climate of Western Kansas is still just what it has been for a long period past. Our only hope is in securing some slight protection from its wind storms, as the first essential step towards reaping for our soil the advantages of the rainfall.

Horticultural.

RURALISMS.

NEW-YORKERS who think of such things at all are proud of the Central Park, or at least have been; but there is not one of them who is proud of the Central Park Commissioners as commissioners, whatever he may think of them as men. For years past almost every thing connected with the Park has been in a muddle, and during most of the time the meetings of the board have been characterized by a species of wrangling and personal recriminations not at all calculated to raise the board in public esteem.

It grows worse daily instead of better, and in the meantime the Park suffers. Instead of improving it deteriorates. This will continue till the Board of Commissioners is lifted out of the sphere of politics. Almost from the beginning this incubus has clung to the necks of the Commissioners and everybody connected with the work, from the superintendent down to the man who cleans the walks, has been under its influence. It is no wonder that every thing is going to the bad, and that the fault is shifted from one shoulder to another, with nobody to blame. Just now there seems to be a dead-lock, with a very remote prospect of its being broken. As there is no affinity between politics and the adornment and keeping of a park for the pleasure and benefit of the public at large, the sooner the connection is severed the better for the park and the public.

The show of bouquets, ornamental designs, etc., at the late exhibition of the New York Horticultural Society was very meager, on account of the scarcity of flowers, and the few on the table were mostly of that solid, unnatural, and ungraceful style now so common, in which natural effects and fine taste are looked for in vain. It gives me pleasure to notice, however, one or two exceptions, especially the vase of flowers of Mr. Riddle, which was a really commendable piece of work, evincing both judgment and good taste. It is so pleasant to see flowers arranged as nature grows them.

The strawberry show of the New Jersey State Horticultural Society was much the best I have seen this season, though not as good as they usually have. I had the opportunity of comparing and testing the seedlings, three of which were good, and one of decided excellence, which I afterwards learned was raised by Mr. Durand. It was a large, round berry, of good form and bright color, with a decided vinous juice and rich flavor. It was well named Superb. I know nothing of its habit or productiveness. I am told it is not yet for sale. Of the other two, one was named Jersey Queen (very good), and the other was only numbered, but resembled the Bidwell. Another seedling was named Cettywayo; but if that unfortunate gentleman resembles the fruit, I must respectfully decline his acquaintance.

Among the more recently introduced strawberries, I am much pleased with the Bidwell. I have seen it growing in different places widely apart, and in all it was decidedly good. It presented its best appearance, however, at Mr. Roe's, where it seems to be a favorite. Large, well formed, and very productive, with a flavor somewhat like that of a well-ripened Black Tartarian cherry, it promises to become popular. I rather like the Triple Crown, but I fail to perceive the fitness of the name. The Glossy Cone is a berry somewhat talked about. It presents a pretty appearance. I saw it at Mr. Henderson's, Mr. Roe's, Mr. Force's, and several exhibits at the New Jersey show. It is very productive, a goodly portion of the berries, however, being small. At Mr. Henderson's it was good, but at the New Jersey show and at Newburgh the flavor was rather flat.

HORTICOLA.

The Caroline and New Rochelle Raspberries.

MR. CHARLES DOWNING writes us as follows:

"As to the Caroline and New Rochelle raspberries, I know very little about them. I was at E. P. Roe's the other day and saw them for the first time. The Caroline is moderately vigorous in growth and moderately productive. Fruit medium to large, of a deep orange-yellow; flesh rather soft, juicy, sweet and rich.

"New Rochelle, very vigorous and very productive; canes strong and branching. Fruit medium to large, of a dark maroon color; flesh moderately firm, juicy, subacid—good for culinary uses, but not good enough to eat. I found many of the berries with a decayed spot on them, which, if common to them, will be very objectionable; it appeared somewhat like sun-scald.

"The above is what I saw of them at Mr. Roe's, and may not be their general character of other years, and it is, therefore, not to be fully depended upon."

Farm Topics.

THE DISCOUNT OF LATITUDE DISCOUNTED.

IT has been taught and accepted that crops in ripening are governed, in a great measure, by latitude, and that there is scarcely a well-marked exception to this rule. However, this year there have been so many and such varied cases in which crops North have ripened before crops South, and such a simultaneousness in maturity over several degrees of latitude, as to assure us that some unusual forces have been at work, concerning which we have no clear ideas.

Going south from Central Illinois to New Orleans during the last half of March, I noticed, after having reached the southern line of Tennessee, in latitude 35 deg., there was little difference in the measure of development of the fruit buds of the peach over the more than five degrees of latitude between this point and New Orleans. Stopping off at Brookhaven, Miss., a week or ten days later, I observed that the buds of the apple trees and some other fruits and shrubs were still nearly dormant, while some of the native oaks were half out in leaf—strawberries were getting ripe, early potatoes and peas were in blossom, and market gardeners were shipping produce North. At this date, too, and in spite of the advanced stage of indigenous vegetation, little or no plowing had been done for cane and cotton, but the work of clearing up the fields was going on. And lately, to show that I was not deceived by appearances, I find in the Planters' Journal for July a communication from Mr. F M. Brewer of Crystal Springs, Miss., who, referring to his crop of Turner raspberries, says: "They were like the peach this season, late in starting to grow. The same variety of berries was shipped from Southern Illinois to Chicago two days ahead of me." But Crystal Springs is in Miss., about latitude 32 deg., and the Southern Illinois fruit region lies between 37 or 38 deg. Here we have the singular anomaly of fruit ripening two days earlier in the Northern than in the Southern situation, with the distance of nearly 400 miles between the two. Here is an example of "the discount of latitude discounted" of a most significant kind.

Centralia in Marion Co., Ill., is the center of a great wheat and fruit producing country. But its strong point is the strawberry crop, of which 1,000 acres were gathered there this season, and to which additions have been made to increase it to 1,600 acres in 1881. Formerly Centralia strawberries had a monopoly of the Chicago market for a week or ten days, because they made their appearance before the crop of the black soil counties and that from the sandy lands of Michigan, which usually ripen about the same time. But this year the strawberry crop from Centralia, in latitude 38, to Michigan, in latitude 43 deg., seemed to ripen almost at the same hour, and the fruit growers, for a distance of three hundred miles north and south, sent the best of their crops forward at nearly the same time. And so far as concerns the Winter wheat and early potato crops, the same simultaneousness in time of ripening has been remarked.

No doubt a good share of the earliness of Northern crops over Southern ones and the simultaneousness of the epoch of maturity over long distances north or south, are due to the differences in soil of the two or three regions. Thus the compact, light-colored, sandy loams of the South absorb heat slowly; the gray clays of Southern Illinois faster; the black soils faster still; and the yellow sands of the Michigan fruit region fastest of all. And since the growth of plants depends more on the temperature of the earth than on that of the surrounding atmosphere, the soil, owing to its greater absorptive power North than South, matures crops earlier, or at nearly the same time, over great intervening distances.

But these paragraphs have not been written for the single purpose of making the statement of the fact, nor with the intention of ignoring the existence of certain great and unknown cosmic causes which have operated the present year and made it one remarkable alike for unusual rainfall, an excessive quantity of thunder and lightning, high winds, cyclones and tornadoes, and a very extraordinary measure of vigorous vegetation, more or less associated with fungus germs; but rather to suggest to the Southern fruit grower how he may and can get all, or more than all, the advantages of his Southern situation. He must tile-drain his lands, and manure and cultivate in the most thorough manner, and in that way he will be able to bring the temperature of the soil up to that of the surrounding atmosphere, and so ripen his crops according to the measure of his latitude. The fruit business in the South is just in its infancy, but we shall never know what it is capable of becoming until some of the best forms of modern agricultural practice have been applied to the business. The advanced men among the Centralia fruit growers are already aware they must tile-drain their strawberry fields in order to compete with their northern brethren, and it will not be long before tile-drainage will have become the custom of that country and of all countries which hope to make great and abounding crops.

What about the figs? Considering the deliciousness and healthy character of the fruit, the demand there is for canned figs put up after the manner of a well-reputed New Orleans establishment, and considering the fig is perfectly hardy in all that broad belt of country known as the "Piney Woods region," it is at least surprising so small crops are made and we hear so little about them. I suspect the truth to be that though the tree is a hardy one up to 33 degs., even 35 degs., and attains the size of a half-grown apple tree (which as to form and contour, though not as to foliage, it considerably resembles), the difficulty lies in the fact that, in most cases, these trees are barren and as such are regarded as cumberers of the ground. However this may be, I should like to hear from Southern correspondents of the RURAL a relation of the facts in the case. We know that, as commonly reputed, the fig, as a general thing, demands to have a dry, deep and not too rich soil, and in that respect resembles the olive; but we know, further, there are varieties which will stand as much moisture as a duck or a turnip, and will revel in a soil of the greatest depth and richness. Possibly the trouble with the fig in the South is, that the varieties in use and cultivation are not of the right kind, and where those which suit the soil have been selected and propagated the result will be more satisfactory. But hear a foreigner—a French *savant*—on this point: "The fig will live and flourish on all sorts of soil where it is not too wet during winter, but it prefers those which are calcareous, and on these it produces its best fruits, except on those which are schistous or slaty; but on these we often see it suffering from drought. There are varieties which require to be placed where they can get the benefit of irrigation, or at least, where the soil is moist, cool and deep, in order to produce large crops. Such as the *Barnissote*, the *Servantine* and the *Ballone*; and others do well in a deep and cool, but not too moist soil, like the *Mouissane* and the *Verdale*. Finally, some species easily withstand high and dry lands which are not schistous, and here they produce better crops than on richer, deeper, cooler and moister soils, and this is particularly the case with the *Marseillaise* variety."

It strikes me the agricultural rehabilitation of the South will come rather through the cultivation of crops which latitude and climate give it a monopoly of and through industries related to them rather than in competition against Northern agricultural production and Northern manufactures; and, therefore, it is I suggest the extention of fig cultivation as well as that of all other sub-tropical fruits. And in conclusion, to come down to the facts of the case, in what possible way, in what tried or untried crop—the present state of the soil being considered—can the cotton States make as good and sure a return for their labor as in continuing to make cotton the base of their agriculture? Farm Economy.

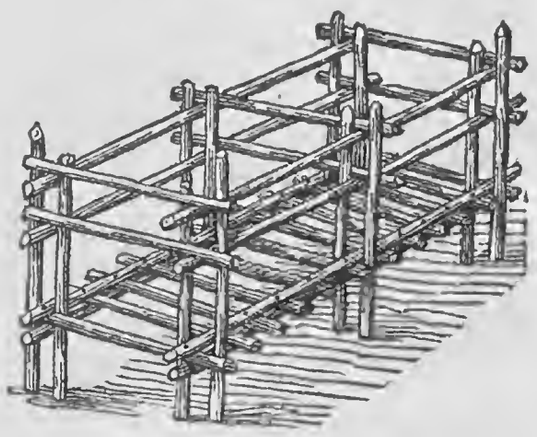
THE USE OF SOILING CROPS.

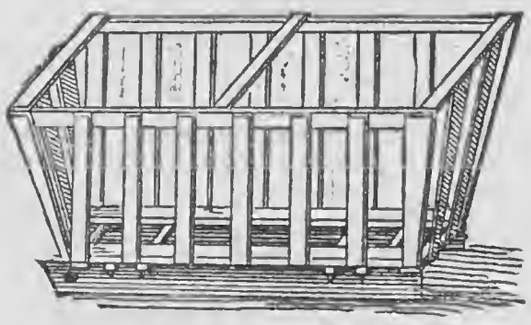
THERE is a great economy in the right spending of what is earned or saved. So one may grow crops for soiling successfully and waste his opportunity in the using of them unless they are fed in a proper manner. When partial soiling is practiced for the purpose of helping out pastures, or with the intention of manuring a poor piece of land by keeping cows and feeding the crops upon it so that the manure may be spread over the surface, two ends are served. But the method is somewhat different from that practiced for complete soiling. In the one case a field that provides some pasture is used for what it is worth and the fodder is cut and carried to the cattle and fed in racks; in the other the cows are kept in yards and stables, the fodder is carried to them, and their quarters are well littered and bedded with absorbants and materials for composts and manure. There is more labor involved in the latter method, but the larger product derived from the cows, through the high feeding; the quiet rest and absence of unnecessary and wasteful exercise; the freedom from troublesome insect pests and the saving of time and waste of material and product in driving the herd back and forth to pasture, all these repay the extra labor liberally and *the food is all paid for by the large quantity of manure made*. Therefore the practice is profitable upon dairy farms, grain farms, and fruit farms; anywhere in fact, except upon such farms as cannot be plowed and must, therefore be devoted, solely or chiefly to pasture. In either case the gain by avoiding the waste and cost of fencing the whole farm into fields is to be considered.

We will follow up the management of a herd of cows managed either by partial or complete soiling. In the former case there is a pasture or stubble field, such as has been referred to. Here the cows are kept through the day and night, being either milked in the field or driven home for that purpose. If there are water and



FEED RACK.—FIG. 238.

shade in the field, the former is the better plan. A few simple racks are provided, such as that shown at figure 238, which is made of rails or round poles put together with carriage bolts and mounted upon two half-round heavier pieces that may serve as runners upon which to move it from place to place in the field, or such as that shown at figure 239, several of which may be set permanently in the field in several places. Or for a few cows a portable sled rack made as shown at figure 240, may be used. This can be loaded in the field and drawn to the pasture with its load, and if two are provided so that an empty one be taken away when the filled one is left, some trouble will be saved. The fodder for morning's use is cut at night. In the morning the field is visited early: the evening's fodder is cut and left to wilt through the day; and the fodder cut the previous evening is drawn to the pasture and given to the cows. The quantity given depends upon the amount of food to be picked up in the pasture. If this amounts to very little 50 or 60 pounds will be required daily for each cow. This weight is easily estimated, if a few bundles are weighed once or twice with a spring balance. No more should be given than is cleanly consumed with evident appetite.



MOVABLE FEED RACK.—FIG. 239.

About five in the afternoon the fodder cut in the morning is picked up and fed, and the morning's feed cut. If rain threatens, sufficient fodder for two or three feedings may be cut and hauled to the pasture, cocked up outside and covered. It is dangerous to feed 30 pounds of wet fodder to a cow at a meal. The excess of water is likely to cause bloat and it will be safest to reduce the ration to one-half, when it cannot be given otherwise than saturated with rain; and to sprinkle a quart of fine ground feed with a handful of salt upon it as a precaution against danger. As one part of the field is covered with manure the racks are moved, and the foddering done upon another part, and once a week the droppings should be broken up with a fork and scattered. For its manureal value, as well as its feeding value, one or two quarts of cotton seed meal can be profitably given to each cow daily. It will have an excellent result in moderating the laxative effect of the succulent fodder, will increase the yield of milk and butter, and will add much to the value of manure. It is safe to estimate that the five cents daily thus spent will be returned thrice over, or once in each of the different ways mentioned. In June, the last of the clover was expended and green oats will be ready for cutting if these have been provided for the stock. If the soiling has not yet begun, early corn fodder is now ready for the first cutting, and the ground should be at once replanted with corn up to the middle of July when Hungarian grass or millet may be sown. For partial soiling sweet corn is the best crop; anyone who thinks differently has either never tried it or has tried it under adverse circumstances. In three years' feeding with sweet corn, and common field corn, the writer has found the former to be more productive of milk, and at least one-fourth more satisfying to the cows. The excess of sugar it contains is nutriment, and 20 pounds of it are quite equal to 25 pounds of field corn fodder.

In complete soiling, the feeding is best done in the stables at seven in the morning and after milking; and at five in the afternoon; a little mess of something may be given after milking in the evening. If the feeding is done in the yards, racks should be provided to prevent waste of the fodder. But experience has shown that the feeding is better to be done in the stables and after milking. The cows stand in quiet expectation during the milking and are not restless and troublesome, as they would be if the feeding had been done before the milking.

BOLTS.

"How many sizes of machine bolts have you, Mr. Hardware dealer?"

"Fifteen."

"You ought to have more. Count out for me five of each size, slim, stout, short and long. Three cents each, etc.; all right."

When I returned to the farm I walked to the meadow to see how the mowing progressed, and found John just started for the house, mower and all.

"I broke one of the main stay bolts, and can't find any to fit. I shall have to get the blacksmith to make another," said John.

"Turn back, man! I wouldn't have that machine lie idle this afternoon for ten dollars. I'll start you in five minutes."

This is one case among hundreds. A bolt or two will splice a wagon tongue or start the silent thrashing machine when a dozen laborers lie idle. CHAS. A. GREEN.

Dairy Husbandry.

COUNTRY LIFE.

Observations Among Rural Subscribers.

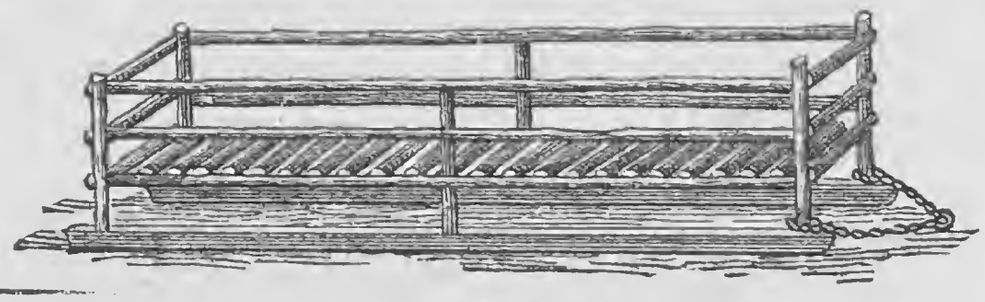
COL. F. D. CURTIS.

HIRAM MOREHOUSE is a successful farmer, and has a great deal of pride in his dairy. With commendable forethought, a number of years ago he obtained the services of a Jersey bull from Kirby Homestead, and raised a number of half-bred Jersey cows. He did not get a sufficient number to meet his wishes, and so made up the balance with the best native cows he could obtain. With the help of the Jersey blood and skillful, careful management of the milk, he produced a quality of butter which was always sought for in the market.

Not satisfied with these results, however, as the hot weather always proved a serious drawback in the raising of the cream and the making of the butter, this Spring he purchased a Moseley Cabinet Creamery, and now with the aid of a small quantity of ice, he makes in "dog-days" just as good butter as in a more favorable part of the year.

The possession of this creamery, with its economical appliances and results, put Mr. Morehouse in a philosophical frame of mind, and he thought he would go a step further and test each cow by herself, as he got a notion that all cows were not alike valuable, and those which gave large messes of milk were not likely to give as rich milk as those which gave less. While this might not always be true, he still thought it reasonable that it might be the case. His experiments revealed the fact that two of his "best cows,"—the two which gave the most milk—furnished the least cream. The one which filled a pail night and morning produced scarcely none at all, which demonstrated the fact that the "best cows" were entirely unsuited for a butter dairy. No doubt these cows would be profitable for cheese making, or where the milk is sold, as quantity, in the latter case, is usually more of an object than quality.

The experiments of Mr. Morehouse in testing the comparative butter value of his cows has opened the eyes of many other butter dairymen as to the fact whether they are not milking their "best cows" and going through all the work and trying to make butter from them, with a decided loss. Under the old system, of setting milk in pans and mixing it together, a cow might be milked all her life without any return for the feed and care bestowed upon her other than the income derived through the swill barrel—certainly a small percentage.



SLED RACK.—FIG. 240.

We once knew a cow which gave a large mess of milk, but could never fatten her own calf. Her owner, we recollect, said that while this was true, when her milk was mixed with the other cows' it made butter.

This is quite a common notion among farmers, that by mixing the milk it all counts and makes butter alike. Not one farmer in a hundred ever takes the trouble to test his cows separately. It is unwise not to do so. We hold that the milk of a cow, which would not make butter when set by itself, is worthless for a butter dairy, and no amount of mixing with other milk will impart to it the butyraceous qualities which it lacks. We would go still further and agree with the American Dairy Cattle Club in their standard, that if a cow will not make a pound of butter a day, she is unprofitable. We are making this Summer twice as much butter as formerly, with the aid of our Cabinet Creamery, in connection with the extra care which the cows received last Spring. A hungry cow cannot give rich milk. It is true that an excellent cow may be thin in flesh, and at the same time have a large flow of good milk; but such a cow must be sufficiently supplied with nutritions food, so that her system is not depleted, or else her milk will be thin and watery. Such a condition is indicated by a staring coat, harsh skin and evidences of weakness, while the opposite shows a soft skin and hair, with a bright eye and a sprightly step. A successful dairyman like Mr. Morehouse never spares feed for his cows.

WHY ALL THE BUTTER GLOBULES DON'T RISE.

T. H. HOSKINS, M. D.

MR. WILLARD, in a recent article in the Country Gentlemen, attributes the non-rising of the minuter globules of cream to their being weighted with an enveloping membrane of "nitrogenous matter." He seems to think there *can* be no other intelligible cause for the prolonged suspension of the lesser globules. And I regret to see that Mr. Goodman adopts without reserve the "membrane" theory in his ingenious article upon a new nomenclature, in the RURAL of July 3. I say I regret it, because Mr. Goodman is one of the advance-guard of students and writers upon dairy topics, and we have a right to demand of them exactitude in matters of fact. No one acquainted with the present state of knowledge in regard to this very difficult point, will say that it is settled affirmatively. Many microscopists of eminence deny the existence of an enveloping membrane upon the globule. They are supported by the authority of leading chemists and physiologists, and while the question remains in this state of suspense, we who can claim only the standing of practical observers ought not to dogmatize. Having studied the matter for 20 years, I am yet not prepared to dogmatize on the other side. I look forward, indeed, with great confidence to the appearance of some conclusive demonstration of what I believe to be the fact—that the butter globule swims free and uncovered in the serum of milk. I see many reasons (some of which I have rehearsed in these columns) why this must be true, and I know of no reasons on the other side except the existence of optical appearances under the microscope, which all experts know to be illusive, and the *a priori* hypothesis that the membrane is ruptured by churning, or removed by the action of the acid of sour milk. As butter is easily and quickly made from sweet cream, and as from sweet cream the best keeping butter in the world is now produced, it would seem that this hypothesis meets with slim support from the practical side.

But what I took up my pencil particularly to mention was that there is quite sufficient cause for the continued suspension of the minuter globules, in the very fact of their minuteness, without need of calling in the idea of their being weighted by a membrane. While the floating power of the larger globules is sufficient easily to overcome that resistance, yet as they decrease in size the floating power diminishes until the superior levity of the smallest of them is almost or quite counterbalanced by the resistance (viscidity) of the medium in which they swim.

A pertinent illustration of this comes pat before me in a glass of water upon my desk. This presents a slightly milky or opalescent appearance, which has existed in my well water for nearly a week, and recurs every month or two. Examination under the microscope reveals the cause of this lack of clearness in very minute flakes of mica, which present themselves quite abundantly in the field of the microscope under a power of 200 diameters. The well is a bored one, curbed with wood, and the water is found in a stratum of quick-sand 34 feet from the surface. I accepted this rather than bore deeper, but at the cost of such milky-looking water occasionally caused, no doubt, by little slides of quick-sand from the sides of the cavity below the end of the tubing. The fine particles once set afloat are kept from sinking by the resistance of the water to their movements. They go *with* whatever currents occur in the water, but their superior weight only slowly prevails to make them move *through* the water and deposit themselves at the bottom of the vessel. And yet mica in mass, or in particles of a size sufficient to be seen by the naked eye, sinks at once in water.

The difference in specific gravity between the cream globules and the serum is not nearly so great as between mica and water, yet it is only the smallest of the milk globules that fail to rise, and the total quantity left in the milk under cold setting properly managed is but a very small percentage of the whole. This fact, so far as it can weigh at all in connection with the matter of an investing membrane, goes against it, because so little is the difference in weight between the serum and the fat of the butter globules that a caseous membrane would probably overweigh a much larger proportion of the globules than experience shows to be actually retained in the milk.

Orleans Co., Vt.

The Home Market for Cheese.

What "A Western Farmer" has to say on this subject in the RURAL for June 12 is excellent advice to dairymen, and is the true method to extend the consumption of this, one of their greatest products. But in order to suit small families, a sufficient number of cheeses should be made, not to exceed a weight of over three to five pounds. Of such sizes they could be consumed after cutting, before drying up or molding. The best shape for them is like that of the common round, flat form. If in balls, or pine-apple shape, the rind is so thick as to make too great a percentage of loss in cutting up for the table. These cheeses should vary from a middling to best quality, so as to be sold at different prices, and the manufacturer's name be stamped upon them, so that the purchasers could be sure of their quality. A fancy shape is not requisite to obtain a good price. Customers would only look to the quality.

My family being small, I am obliged now to purchase two or three pounds of cheese at a time of the grocer, which are cut from a large, common-shaped cheese. If I buy more at a time, and keep it in quite a dry place, before my family can consume the whole the last part becomes so hard as to be uneatable. If put in a damper place, it then gets moldy. Small cheeses could be easily kept till consumed, without danger of getting either too dry and hard, or moldy, as the rind would protect them from both of these for a reasonable length of time. Z.

BLOODY MILK.—Cows coming in are not generally over-fed by dairymen, but as soon as calved, a grave error is often made in the sudden change to a rich food, which in many instances will give rise to some disease of the mammary gland by over-stimulation. Cows with large udders are liable to bruise the gland by lying on stones and setting up inflammation of the part injured—hence bloody milk.

Treatment.—Place the animal in a poor pasture and *feed* on laxative food. Bathe the udder with cold water and give one to one and one-half pound of Epsom salts.

The Herdsman.

POLLED NORFOLK AND SUFFOLK CATTLE.

AT the recent show at Downham, England, it is reported in the Agricultural Gazette, that some of the Norfolk cows exhibited there were as "meaty as the Aberdeens" (Polled Angus), "and as milky as the old Suffolk stock." Our readers will recollect that the Norfolks (red, hornless cattle) have heretofore been bred about this size, and as fine in all their parts as the Devon; and although fair milkers, they did not excel at the pail as much as those of a cognate breed in the neighboring county of Suffolk. The latter are lighter and of not so brilliant a shade of red as the former, nor are they quite so fine in their points. On the other hand, they are larger in bulk and greater milkers. We believe they are now mixing the two breeds somewhat, and are making selections from this cross, which combine the merits of the two. They are also crossing the Norfolk to a moderate extent with medium-sized, compact, red Short-horned bulls from milking families. The produce of these are increased in size considerably—a great desideratum, as the original Norfolk were generally too small for a profitable breeding of the present day. Out of these three crossings we shall expect that an improved polled breed of cows will grow up, excelling in the diary, and when dried off for fattening, laying on flesh quite as rapidly as the Short-horn, and that of as good a quality. It will then become one of the most valuable

breeds of cattle, and well worthy of importatioo.

First-Class English Mutton Sheep.

As sheep of this class are annually becoming of greater consideration to the farmers of the United States, we will give a few notes made upon them at the late exhibition of the Bath and West of Englaod Society. The South Downs are regarded as the most hardy, active and industrious lu getting a good livlog on scanty herbage, and are the best suited for hilly lands. Their mutton and wool are of first quality.

The Hampshire Downs are characterized as a coarser edition of the South Down.

The Shropshire Downs are larger and more prolific, yet require better pasture than the South Down, and are not of so symmetrical a form. Their yield of mutton and wool is greater, but neither is of so good a quality.

Oxfordshire Downs are the largest of the Down tribe; give wool of a longer staple than that of the otuers, and mutton quite equal to the best, save that of the South Downs. They are of fine form, hardy, thrifty and prolific.

CROSSES OF POLLED ANGUS CATTLE on Texan cows are highly spoken of, on accouot of the great hardihood of their progeny, the superior quality of their beef, and the absence of horns which tends to reuder them quiet feeders, besides doing away with all risk of injury to their companions from goring, and making it much easier to ship them without injury over long distances. As yet, only a few bulls of this fine breed have been introduced into the West or Southwest; but it is highly probable that the excellent results produced by such crosses, especially when continued for two or three removes from the common stock, will make the Polled Angus a favorite in all the great cattle raising sections.

Scientific and Useful.

NEW JERSEY AGRICULTURAL EXPERIMENT STATION.—4.

THE commercial fertilizers, so much used by farmers, are estimated in value for their chemical composition, which is ascertained by analysis. The following analyses and estimates have been made from samples sent to the Station by different farmers and dealers in the State. The study of these results may prove to be of much interest to farmers.

GUANOS.—The following analyses show the great variation in the composition and value of some of the natural and artificial fertilizers which were sold under this name.

	17	20	14	7	11	25
Nitrogen as ammonia	5.36	4.53	0.31	1.16	1.17	0.00
" in organic matter	1.73	1.43	2.42	2.57	1.83	3.94
Phosphoric acid, soluble	5.25	1.73	5.95	1.09	(3.23	3.83
" " reverted	2.75	1.44	1.38	1.34		
" " insoluble	8.83	8.03	4.06	4.29	3.33	1.93
Potash	2.27	2.16	.60	2.72	2.27	....
Cost per ton	$55 00	$45 00	$45 00	$40 00	$40 00	$30 00
Estimated value per ton	$37 00	$49 00	$34 65	$29 03	$24 68	$23 81

17. Peruvian Guano No. 1. Sampled from stock of Garretson & Bowne, New Brunswick—fine and dry; a good sample of Peruvian guano.

20. Peruvian guano.—From stock of G. F. Doughton, Moorestown, sent by S. L. Roberts, Hartford, N. J.—Fine, but caked. It was peculiar in containing only three per cent. of moisture, but it contained about 25 per cent. of common salt.

14. Manhattan blood guano. Sampled from stock of Garretson & Bowne, New Brunswick. This artificial guano is uniformly in excellent condition.

7. Marine guano, sent by Wm. S. Taylor, of Burlington, and sold by J. J. Allen's Sons, Philadelphia.

11. Marine guano, sent by G. T. Haines, of Haddenfield, and sold by J. J. Allen's Son's, Philadelphia. Both these samples were in good condition and are manufactured articles.

26. Eastern Island fish guano, sent by Samuel L. Burrough, Merchantville, from the stock of Wilson Fitzgerald & Co., Camden. This sample contains nearly 40 per cent. of sulphate of lime, which possibly was used as a drier.

SUPERPHOSPHATES.—The followiog are analyses of samples which have been sent to the Station for examination.

	22	16	19	8	18	21
Nitrogen in organic matter	1.98	1.61	1.64	1.19	2.11	1.64
Phosphoric acid, soluble	3.97	4.42	5.15	2.27	2.40	2.30
" " reverted	1.73	2.62	0.35	1.57	2.91	1.54

10. Stockbridge manure for corn, manufactured by Bowker Fert. Co., Boston & New York. Sampled by T. S. Evans, from stock of Garretson & Bowne, New Brunswick.

13. Mapes' complete fertilizer, A., manufactured by Mapes Formula and Peruvian Guano Co., N. Y. Sampled from stock of Elias Runyon's Sons, New Brunswick.

23. Phuine, manufactured by Moro Phillips, Camden; sent by Wm. B. Cooper, Camden.

27. Economical, manufactured by Baugh & Son, Philadelphia; sent by J. G. Whitall, Woodbury, Gloucester Co.

GEO. H. COOK, Director.

New Brunswick, July 3, 1880.

Miscellaneous.

Cuzco Corn.

I AM of opinion that this is the same kind of corn that was sent to me from Peru, about the year 1847, and samples of which I distributed among my friends for trial, from New York as far south as Florida. It had an immense growth of stalk. In New York it shot up 18 or 20 feet high; far south, if I mistake not, 25 to 30 feet high, according to the richness of the land. But in neither locality did it produce a single ripe ear—at the North, in fact, it did not ear at all; while at the South, a few abortive cars were formed, but so high up the stalk that my friends humorously wrote me they had to get a tall ladder to place against the stalks in order to pluck these ears.

A. B. ALLEN.

[As we have already stated, we tried this "Cuzco" corn several years ago. There was no appearance of "sets" when frosts occurred. That this corn should be advertised here in the North as something wonderful and that such advertisements should be permitted to pass without editorial comment, are all there is "wonderful" about it.—Eds.]

WHAT OTHERS SAY.

ADVANTAGE OF BREEDING GOATS.—Mr. A. B. Allen writes as follows in the N. Y. Tribune: There are thousands of acres of poor, stony, hilly and rocky mountain land in the United States, which can never be cultivated to any profit; but if not wanted for the growth of wood and timber, it might be made to yield a fair income, if stocked with a good breed of well-fleeced and large milking goats. The cheese made from such brings an extra-high price, and the milk is very beneficial, daily used, to those who are afflicted with certain complaints. Many persons resort to the mountains of Switzerland every summer for the express purpose of drinking goat's milk drawn fresh from the udder. In addition to the cheese and milk, the fleeces of wool, or, more properly, hair, shorn from a choice breed of goats are of considerable value. During the first four months of this year 4,934,443 pounds of goats' hair were imported into England, valued at £407,797—equivalent to about $2,000,000 of our money. This would be within a fraction of 40 cents per pound, about the average price of good sheeps' wool.

FROM the First Report of the Cornell University Experiment Station (1879-80) we take the following interesting items from the report of Prof. I. P. Roberts:

I.

WHEAT—DIFFERENT FERTILIZERS. 1874-5. Plots one acre in size.

Treatment.	Yield. Pounds
1. 16 tons farmyard manure, moderately well rotted, applied on surface and harrowed in	583.5
2. 100 bushels lime ashes from lime-kiln, applied on surface) cost 15 cents per bushel	561.5
3. 200 pounds Ralston's superphosphate, drilled with wheat	603
4. 200 pounds Woodruff & Chamberlain's superphosphate, drilled with wheat	648.5
5. Nothing	441.5
6. 2000 pounds Phillips's improved superphosphate, drilled with wheat	618.5

The season was poor and the Wioter severe, and many pieces of wheat were plowed up. The soil was clayey: the clover and Timothy sod was plowed in July; the seed (Clawson) was drilled September 8 and 9. Land in fine order. All the plots were sowed to Timothy a few days after the wheat was sowed. The great injury to wheat which occurred in March permitted the Timothy to make a very rank growth, especially on plot No. 1, where farm manures were applied; from this fact the yield of No. 1 was diminished far more than any other. The increased growth of the grass on this plot over the others was very noticeable the next year.

IV.

WHEAT—DIFFERENT METHODS OF SEEDING AND MANURING. 1875-6.—The field and arrangement of plots were the same as in I.

Treatment.	Yield. bu.	lbs.
1. Drilled, 2 bushels, 2 bushels plaster	22	55
2. " 2 " no fertilizer	20	40
3. " 3 " "	18	40
4. " 2 " 200 lbs. superphosphate	23	20
5. " 3 " " "	28	20
6. " 2.25 " " "	21	15
7. " 2 " " "	21	—
8. Broadcast, 2 bushels, " "	18	30
9. Drilled, 1.5 " " "	*28	50
10. " 1 " " "	*25	—

* Protected by fence and snow.

V.

GERMINATING POWER OF OLD WHEAT. 1874.—Two hundred varieties from the museum, which had been five years from England, were sowed and all failed to germinate. These varieties had been kept unthrashed in the museum under the most favorable circumstances.

IX.

WHEAT—SUMMARY OF RESULTS.

DRILLED AND BROADCAST SOWING.

1875	24	56	22	30
1876	21	—	18	30
1877	25	30	24	45
1878	24	24	22	—
Average	23	56¼	21	56¼

THICK AND THIN SEEDING.

	bu.	lbs.
1 year, 8½ bushels	30	50
4 years, 8 "	23	28½
4 " 2 "	20	15
2 " 2¼ and 2½ bushels	18	22½
3 " 3 y'rs 1½ bushels and 1 year 1¾ bush.	15	25
1 " ¾ bushel (protected by fence and snow, hence cannot be fairly compared with others)	25	—

Comparison of all plots phosphated for four years with adjoining plots on which no fertilizers were used.

	bu.	lbs.
Average of all phosphated plots	23	31½
" " adjoining unfertilized plots	22	33

Phosphates do not seem to produce marked results on pine and hemlock lands of drift formation; results upon similar soils in other localities sustain us in this inference from our experiments. On maple and beach lands of a different formation they have produced marked results.

Comparison of all plots plastered for three years with adjoining plots unplastered.

	bu.	lbs.
Plastered, average	24	33½
Not plastered, average	23	41½

Comparison of plots hoed for two years with adjoining plots not hoed.

	bu.	lbs.
Hoed	18	50
Not hoed	23	10

It must be remembered that while the plots were of the same size, there were twice as many drill marks in the plots not hoed as in the hoed, and consequently twice as much seed upon these plots.

V.

Not subsoiled, 2 years	48	33

C.

EXPERIMENTS WITH CORN.—All quantities, unless otherwise designated, relate to the acre, and, as to the crop, relate to bushels and pounds of ears, 70 pounds of ears being allowed to the bushel. All plots were separated by one vacant row. All manures, unless otherwise stated, were dropped in the hill and mixed with the soil.

I.

CORN.—DIFFERENT CULTURE, LIMING, SUCKERING 1875.—Plots 1 to 13 inclusive were planted with Eastern, 8-rowed, yellow corn. In 1874 the ground was in corn, without manure, and in 1872 and 1873 in clover and Timothy. The soil was a sandy loam.

Treatment.	Yield lbs. per plot. Sound.	Soft.	Yield. bu.	lbs.
1. Ridge culture	352	55	58	10
2. Deep "	290	19½	44	15
3. Shallow "	324	43½	52	35
4. Continuous culture, 7 times	362	22	54	60
5. Drilled culture, 1 stalk per ft.	365½	18	54	55

III.

CORN—STOCKBRIDGE FERTILIZER, 1876.—The soil was clayey. In 1873 the land produced wheat, no manure being used, and in 1874 clover and Timothy, mowed for hay in June and for seed in September; in 1875 it was mowed for hay twice. It was plowed in September, 1875, and replowed May 23, 1876.

A plot numbered 2, of .25 of an acre, received a dressing of 180 pounds of Stockbridge corn manure, said to contain 16 pounds of nitrogen, 19.5 pounds of potash, 7.75 pounds of soluble phosphoric acid, and costing $6 25; it was claimed that this quantity applied to a quarter of an acre would produce 12 5 bushels more than the natural yield. On the two sides of this plot were plots of one-eighth of an acre, numbered 1 and 3, which were unfertilized.

The fertilizer was sowed broadcast after plowing, and harrowed three times before planting. Plot No. 2 contained 1,102 hills, and yielded 1,070.5 pounds of corn in the ear, all of which are good and sound. Plots Nos. 1 and 3 contained the same number of hills, were planted, husked and weighed at the same time as No. 2, and weighed 1071.25 pounds. This also was sound, but not of as good quality nor as highly colored as that of No. 2. The stalks on No. 2 were perceptibly larger than on Nos. 1 and 3, and all through the season had a darker and more luxuriant color.

VIII.

CORN—SUMMARY OF RESULTS.—

Comparison of all plots phosphated, for three years, with adjoining plots on which no fertilizers were used.

No fertilizer	40	1
Phosphated	42	10
Plastered	45	—

There is an immense field for original investigation in horticulture. Some of Mr. Lazenby's experiments seem to us neither original nor well chosen.

His tests with the germination of seeds procured from various seedsmen in this city are quite at variance with those made by the Michigan Agricultural College and reported in these columns two years ago, much to the displeasure of those seedsmen whose seeds were thus shown to be the least valuable. Mr. Lazenby's report as to the value of weevil-eaten peas is as follows:

"Some peas, each of which was affected by the pea-weevil, or in that condition usually termed "buggy," were planted and compared with a similar number of sound ones. Not over 15 per cent. of the affected peas germinated, despite the almost universal belief that "buggy" peas will grow as well as others. Of the sound peas over 90 per cent. made a good growth."

The RURAL has kept the subject prominently before the public for two years and has made for itself almost exhaustive tests. It appears that although perhaps not over 15 per cent. of weevil-eaten peas, selected without regard to size, variety or degree of injury, will germinate, yet much depends in single tests upon those conditions, as well as upon the time of ripening, season of planting, etc.

His experiments to ascertain the relative earliness of different sorts of peas are a confirmation of the RURAL'S tests made three years ago upon a larger scale, except that he ranks the Philadelphia Ex.-Early as good in quality, while we estimated it as the poorest of the 27 varieties tested.

IV.

EXPERIMENTS IN POTATO CULTURE.—I. In this test the potatoes (Early Rose) were planted May 10. The soil, a sandy loam, unmanured, and only moderately fertile. Each plot consisted of a single row 50 feet in length. The rows were four feet apart, and the seed was dropped 18 inches apart in the row. The following is the yield in pounds:

Plot No.	Seed.	Yield large.	Yield sm'l.	Tot. y'ld
1.	Small potatoes used as seed	30	55	85
2.	Medium sized whole potatoes	85	38	123
3.	Same size cut in halves, one piece per hill	93	26	119
4.	Same size cut to two eyes per piece, one piece per hill	84	19	103
5.	Cut as No. 4, two pieces per hill	96	24	120
6.	Seed end of potato planted	86	30	116
7.	Stem end planted	88	25	113
8.	Middle of potato planted	23	41	64
9.	Seed planted two inches deep	76	46	122
10.	Seed planted four inches deep	98	33	131
11.	Cultivated flat	94	31	125
12.	Cultivated in ridges	89	29	118

In plots 9 to 12 the seed used was like that in No. 3. The first to come up were the medium-sized whole potatoes in plot 2; second, the seed end in plot 6. Potatoes less than an average-sized hen's egg were classed as small.

PRESERVATION OF GREEN FODDER.—Having a large amount of refuse cabbage leaves, turnip-tops, etc., when we harvested these crops last Fall, we tried the experiment of manufacturing some "*ensilage*," adopting the process used in the manufacture of "sour hay." It consisted simply of closely packing this succulent refuse matter into a pit dug into the ground, and covering it with a layer of earth about two feet in thickness. This pit was opened last April, and the product was found to be in excellent condition, and was readily, even greedily, eaten by cattle. It had not molded in the least, but was changed into a dark-brown product with a strong, sour odor. We were gratified by the success of the experiment for it showed that by this simple process we could save and turn to good account what would otherwise have been lost.

FEEDING VALUE OF CARROTS.—We have fed our work team liberally with carrots the past season and find the crop to be one of great value for feeding horses. One bushel of carrots and one bushel of oats fed in alternate meals were of equal value to two bushels of oats alone, while they can be grown at much less expense. Horses, like human beings, require a variety of food and thrive best upon a ration that involves a change of diet. Succulent food, in part, will always prove beneficial, and this is best afforded by carrots.

A GOOD WHITEWASH FOR FARM PURPOSES.—We find the following in the Boston Journal of Chemistry: "The following is commended for outside work: Into a water-tight barrel put half a bushel of lime, and slake it with enough boiling water to cover it about five inches deep. When the slaking has been effected, add enough water to give the proper consistency, two pounds of sulphate of zinc, one part of common salt, and half a pound of alum. Various colors may now be introduced. A rich cream tint is obtained by adding about three pounds of yellow ochre. A lead or pearl color is imparted by lampblack, red by Venetian red or red ochre, and blue by sulphate of copper. The wash is to be applied as soon as ready, with a painter's or whitewasher's brush. It is durable as well as inexpensive.

THE CATALPA AS A TIMBER TREE.—Mr. C. M. Hovey says that much has been recently said in regard to the Catalpa as a timber tree, and, as it would appear from very recent information, Professor C. S. Sargent, of the Bussey Institute, has directed attention to it, and spoken highly of its value and urged its cultivation for that purpose. It appears, however, that its importance as a timber tree was known half a century ago, and its culture recommended by one so capable of judging as the late President of the United States, General Harrison, of Tippecanoe fame. In June, 1831, General Harrison delivered an address before the Agricultural Society of the county of Hamilton, Ohio, in which he spoke of the Catalpa as follows: "Our old rail fences, whose dilapidated appearance produces such a disagreeable effect around our farms, are as wasteful and expensive as they are inefficient, and the increasing price of timber and the great quantity which will be required demands speedy improvement, for the country is likely to soon lose the material for their construction. If we could procure posts and rails of the Locust or Mulberry they would last, without doubt, a great many years; but the wood of the Catalpa, a tree of such easy culture and of such rapid growth, furnishes, perhaps, a material much more durable than either of the others. This valuable tree is indigenous in the lower or southern part of Indiana, and grows to a very large size upon the Wabash River and several of its tributaries. Its property of resisting decay has been sufficiently verified in the vicinity of Vincennes, where the soil is saturated with water. One of these trees was cut down on the little stream of the Detha, five miles from Vincennes, before there was any immigration from other States. It was certainly a giant in the year 1785, when a colony of Virginians from the Southern Potomac settled there, and this Catalpa served for a foot-bridge for crossing the river. I have been informed by a worthy man, in whom I place great reliance—Dr. Hirom Dickson—that he has recently seen this tree, and found it but slightly injured from the moisture; and he assures me at the same time that a fence built with posts of the Catalpa which had been set in the ground in 1770 by his father, had been recently taken up and reset on his own farm by his brother, Major André Purcell: it had been found yet perfectly sound, and quite as good for the purpose as those which had been put down to take its place. The Catalpa is a very beautiful ornamental tree, but I do not think it is appreciated or has been employed as a timber tree elsewhere than in the neighborhood of Vincennes. It grows with remarkable vigor upon the farm of my cousin, Mr. Short, where it is increased by seeds; and I believe that in places where timber is scarce and the soil suitable to its growth, it offers very great results, not only for fencing, but for the construction of all kinds of buildings."

JUDGE JONES, writing to the Live Stock Journal, says that the draft horses in Liverpool are of wonderful excellence, are obviously well cared for and bountifully fed. They are all of the English Cart Horse or Scotch Clydesdale breeds, of amazing weight and strength, and trained to the most perfect obedience to the direction of the driver without the use of lines. But the cab and hack horses are a sorry-looking set—thin and unsound, with scarcely an animal to be found that is not lame. He never saw a lot of horses that appeared to be so hard worked and badly cared for. The arrangements there for handling, yarding, and selling stock, are excellent, and dealers in foreign cattle have nothing to complain of but the requirement of compulsory slaughter within the yards; and for this requirement he finds from the general opinion of butchers and dealers, that there is no other reason than the advantage it is supposed to give to the British farmer—a much more important character there, Judge Jones is sorry to confess, than he is in the United States. The opinion seems to be universal among the dealers on that side that our cattle have no disease.

MANY of the growers of buckwheat, says Mr. Hyde in the N. Y. Times, act as though the crop was hardly worth raising, putting it out on poor land, half plowed, and fertilized not at all. The consequence is a small, unprofitable yield. Fourteen and a half bushels were the average per acre in Massachusetts by the last census. Now, while it is true that this grain will grow where other grains would scorn to grow, it is poor policy to plow and go through all the other motions for raising a crop and raise only half a crop. If buckwheat is worth raising, let us raise a decent crop. Forty, fifty, and even seventy bushels are reported by some growers. Buckwheat responds to thorough cultivation and good fertilizing as kindly as does corn, and commands about the same price in market. If 40 bushels can be raised on an acre, it is a penny-wise and pound-foolish policy to raise only 14½.

Industrial Societies,

ANNUAL FAIR LIST.

WE herewith present a list of State and local fairs which will be held this Fall in various parts of the United States. Having been compiled from statements made by the officers of the several organizations, we believe the information here offered to be thoroughly trustworthy. We shall, at an early date, publish a supplementary list of fairs the dates of which we have not yet been able to ascertain. Secretaries of associations, the fairs of which are not given here, will do us a favor by notifying us of the time and place of their respective fairs.

RURAL SPECIAL REPORTS.

ALA., South Lowell, Walker Co.—Crops hereabouts are looking fairly well, although corn is a little off color, owing to a protracted season of rain at, or shortly after planting time, followed by a few weeks of very hot and dry weather in May. Cotton looks first-rate, though somewhat late planted. The fruit crop promises well, although peaches were damaged by frosts in April. Strawberries have hung on well, there are yet a few to be found on the vines. The weather is now very hot, though we have just had a cool spell, with some rain. Should we get another season of rain, the crops will be better than for several years past.

B. A.

ARK., Clear Water, White Co.—Frequent and abundant rains are giving an unusually bright out-look for all kinds of farm crops in this section. Wheat and oats, with all the earlier products of the farm and garden, have been harvested and gathered in with a better yield than for many a year. Corn is now setting for ears and has a splendid color. With one or two more rains a heavy yield for this section is assured. Fruit and cotton, however, are the staple products with us, and the prospects for good crops of these are flattering indeed. The estimated net profit of a fruit farm, (mostly Wild Goose plums and peaches) near-by is $15.000. Fruit growers are now busy shipping the earlier varieties of peaches. There is about twenty per cent. more cotton planted than usual, and it looks fully twenty-five per cent. better. So the farmers hereabouts rejoice.

H. C. C.

CAL., Fresno, Fresno Co., July 5th.—The area under wheat in this county is about 100,000 acres; yield about an average crop. Some of it has been damaged by the hot northwest wind. Varieties, Propo, Sonora and White Chili. Of corn very little is grown. Of potatoes scarcely enough are grown for home consumption. Of oats and rye very little is raised. There are under barley 10,000 acres—varieties, Chevalier and bald. Sorghum is as yet an experiment. Fruit, good—varieties, apricots, nectarines, peaches and plums, all the choicest sorts, grapes, all the foreign varieties both for table and wine making. Blackberries, Kittatinny, Wilson's Early and Lawton. Among strawberries, Wilson takes the lead. Raspberries, currants and gooseberries are but an experiment, our climate is probably too hot and dry for the last-named. Figs grow to perfection. Oranges, lemons, limes and olives each and all do well.

S. H. H.

CANADA, Smith's Creek, King's Co., New Brunswick.—In a district here of 30 by 40 miles are about 800 acres of wheat, yielding about 25 bushels per acre; 5,000 acres

of oats, yielding about 35 bushels; 3,000 acres of potatoes yielding about 180 bushels, to the acre. Of corn, rye and barley, not much is grown and not any sorghum. Fruit is not of much account here; the orchards are too young to bear yet. N. M. M.

CANADA, The Ridge, North Hastings, Ont.—Our fall wheat was winter-killed. Spring wheat is yellow in the leaf but growing. Potatoes promise an abundant crop, and to the delight of the farmer, there are very few bugs! Mold's oats are stooling out wonderfully, and the cow-pea is growing with great promise. Two splendid hills of the New Surprise melon. Ovoid mangel growing well. H. T. M.

ILL., Freeport, Stephenson Co., July 9.—The harvest of wheat, rye and barley is good. Farmers are now busily cutting, and they tell me that there has never been a much better show for the farmer than now. Potatoes are mostly the Peachblows and Early Rose—more of the former than of the latter. No sorghum of any account is grown here. Considerable attention is being paid to the culture of tobacco, and with good results. No peaches raised here at all; but the trees hang very full of apples. Apples generally bear well every alternate year, and this is to be a good year. G. B. W.

IOWA, Red Oak, Montgomery Co.—Rye is short in straw, but the yield is good. Wheat, corn, oats, potatoes, etc., all promise a fine harvest. No barley is grown hereabouts. The acreage under each is in the following order: corn, wheat, oats, potatoes. Very little sorghum is grown here. Fruit is a short crop. Season dry. H. S. W.

KAN., Topeka, Shawnee Co., July 7.—The harvesting of the Winter wheat crops in Kansas is about completed and it has generally been saved in good condition. The weather throughout June was favorable; but since July 1st rains have been heavy and frequent all over the State, causing a little injury to those farmers who have been dilatory in stacking, but doing an immense amount of good to our corn crop and grasses of all kinds. Harvest commenced in the southern counties early in June and there the thrashing machine is now at work enabling us to judge more accurately regarding the probable yield of the crop just harvested. The excellent condition of the Winter wheat at the opening of Spring met with a serious check in the heavy freeze about the last week of March and the dry and windy weather in April, and on May 1st the prospects for even a half crop were far from flattering. The wheat commenced heading short, but the timely rains and cool weather in May produced a long head and fine, plump berry, which is thrashing out far in excess of the farmers' expectations. Many who estimated their crops at 6 to 10 bushels per acre are getting double that amount. Many fields that were thoroughly cultivated and seeded in good season will yield from 20 to 30 bushels, while many, again, will yield less than five bushels as the result of late Fall plowing and seeding. From returns obtained from county officials and other reliable sources I find that the Winter wheat acreage of the State will approximate 2,000,000, an increase of nearly 500,000 acres over the year 1879; and that the Spring wheat acreage will approximate 350,000, being a decrease of about 60,000 acres from the previous year, making a total increase of over 400,000 acres in the State. I estimate the total wheat product of the State at 22,000,000 bushels. The eastern part of the State as far west as and including Sedgwick, Harvey, McPherson and Saline counties, will average 12 bushels per acre. The next belt of counties westward, fifty miles wide, will yield five bushels, while those still further westward will not return the seed. The wheat crop of 1879 was 20,550,936 bushels. Corn prospects in Kansas were never finer. Its cultivation is about completed and nearly all has been "laid away." Most of it is tasselled out. It could not be in better shape to take advantage of the heavy rains and hot weather of the past ten days. The acreage last season was 2,995,070, and the product 108,704,927 bushels. The acreage this season will approximate 3,250,000 and with a yield equal to that of last season, which was below the average, the product this season will exceed 125,000,000 bushels. Oats, barley and rye are light crops this season. Flax, potatoes, broom corn, sorghum and Doura or Egyptian corn give promise of excellent crops. The "web-worms" appeared about three weeks ago in some of the extreme southwestern counties and were doing considerable damage to the young corn and tender vegetation, but a heavy rain-storm, about one week ago seems to have completely checked their operations. I have since heard of them in some of the northwestern counties, but whether they are doing serious damage I have not ascertained. Owing to the severe drought in the extreme western counties and the loss of two crops in succession, there is great suffering among the settlers west of the 99th meridian, but the eastern counties, with considerable energy, are organizing relief societies to collect and send supplies to their western brethren to enable them to tide over the present shortage in their crops. Stock of all kinds are in a fine condition. The grazing was never better and the hay crop will be good. H. R. H.

KANSAS, La Cynge, Linn Co.—Wheat—chiefly Walker—is about half a crop; corn promises well. Wheat and corn are damaged by chinch bugs. Potatoes, early, a good crop; late, not many raised. Oats, first-rate. Of rye and barley very little is raised. Of corn we raise Kansas Dent, Ohio Dent, yellow Butcher, and several smaller varieties. Of potatoes, Early Rose is the favorite. Black oats generally are grown. Sorghum is raised to a considerable extent for home use. Of Early Amber and Minnesota Amber they manufacture a first-rate article of molasses here. There is a good prospect for small fruits. Apples, three-fourths of a crop; peaches, half a crop; the trees were nearly all winter-killed. Our standard Winter apples are Jennett, Early June, Harvest Red Streak, and Summer Belleflower. Pears are a failure here, on account of Summer heat. Cattle average about sixteen per cent. over last year; hogs about one-half. M. C. B.

KY., Wilsonville, Spencer Co.—Wheat is turning out very poorly. The finest-looking fields are yielding only from 10 to 20 bushels per acre where from 30 to 45 bushels were expected. All over the State wheat is not an average crop, and there is great complaint of the grain being shriveled. During the last ten days there has been a great deal of rain which will damage our wheat somewhat. More wheat was sown than ever before. Mediterraneau, Amber, Clawson and Fultz are the varieties sown here. There is less than the usual acreage of rye, but here it is good, what there is of it; black rye. Oats are short but the head is good. The weather has been dry until the last two weeks. Barley is about an average crop. Corn from present appearances will be splendid and a large acreage is planted. Potatoes are very fine—chiefly Early Rose. The Beauties of Hebron are splendid; from the one sent by the RURAL last season 30 were planted a week later than the Early Rose, and are now two weeks earlier, I think I will have enough for a splendid patch next year. Very little of the sorghum cane is grown here. Last year I had the first ever seen in our vicinity. It did very well and made splendid sirup which was pronounced the best ever made among us. I have about an acre this year; it looks fine and will come up with my expectation I hope. We have some apples but a great many trees took the blight; the Maiden's Blush had it the worst. Peaches abundant, as are cherries, pears and plums. J. P. P.

MICH., Evart, Osceola Co.—There will be good crops of wheat and corn and also of potatoes and oats where any have been put in. No barley or sorghum is raised here. Clawson is the leading variety of wheat; Peachblow and Early Rose are the favorite potatoes. Of fruit but little is raised yet, for this section has been only lately settled. There is an abundance of wild berries—raspberries, blackberries and cranberries. C. C. V. H.

MINN., Fremont, Winona Co.—The wheat crop in this section will be below the average; we have had two poor crops, and the third not very promising. Oats good. Barley above the average. Corn never looked better for the time of year. Timothy better for hay than seed. Potatoes good; we have not had any beetles to bother us since '78. I don't think that an ounce of Paris-green will be used this season. J. G.

NEB., Ludlow, Adams Co.—As we had no rain for 7½ months, the crops have come up very irregularly. If the grain should fill well, I think there will be from 10 to 12 bushels of wheat per acre in the best places—in others considerably less. There are a few very good pieces of oats, most of it has the appearance of young oats just starting. If the weather should prove good for this, there will be perhaps 25 bushels per acre. Of rye I have seen but one small piece which will be soon cut—some eight or ten acres. There are some fair pieces of barley which I think will make 20 bushels per acre; but much of the barley and oats has been plowed up and planted to corn. The corn bids fair for a full crop: I never saw it look better in any country. Potatoes are looking very good; if the bugs do not take them there will be a large crop. T. T. G.

NEB., Momence, Fillmore Co., July 9.—Crop prospects are good in this locality. Wheat is somewhat thin, owing to the drought in the Spring, but it has large heads. Barley and oats are looking well. Corn is nearly too high to cultivate; it never looked finer. We are having plenty of rain. Potatoes are growing, and are looking well; so are vegetables. Sorghum is not much raised around here. Small fruits do best in this country; trees don't grow well, owing to our high sweeping winds. J. A.

NEW YORK, Corning, Steuben Co.—Farmers have had a fine time this year for setting out their tobacco, on account of so many showers, and it is looking well. I should say that more area is given to the weed this year than last. All crops are growing finely, for they can't help it—showers daily, and often several times a day. Some farmers have commenced haying. Grass on new pieces is good; but on old fields it will be quite light, which shows the advantage to be derived from frequent seeding; and much more seed ought to be sown to the acre than is usually put in. While speaking of hay, I wish to urge farmers to grow more clover; the more I raise, and the more I see of it, the more I am in favor of it. It is surely one of the best crops we can grow. When sowing some peas a while ago, I picked out one hundred weevil-eaten ones, and planted them separately; only ten came up, and but four are making much growth, now. My Mold's Ennobled oats were sown in drills May 3d; they are now over two feet tall and of fine color. Since landowners have been obliged, by law, to cut the weeds by the roadside, quite an improvement in the looks of the highway has been made, and many weeds have already been destroyed. All States ought to have a similar law. This is just such weather as suits weeds, and it requires much labor to keep them subdued; but they should be destroyed by all means before they go to seed, for if not, much more labor will be needed to destroy them next year. By the way, what has become of the "White Elephant?" [Wait a bit.—Eds.] F. H. D.

N. Y., Kirby Homestead, Charlton, Saratoga Co.—The acreage under wheat is nearly double that of last year, and the yield per acre will be double. Clawson the chief variety. Of corn there is an average acreage with prospect of a larger yield than last year. Of oats and barley there is more of the latter with average yield. Prospects for barley better than for oats, and nearly as good as 30 years ago. Of rye there is a large acreage with lighter yield than on average years. Of potatoes there is an average acreage with usual prospects of crop. Early Rose is the chief variety; next Peachblow and Peerless. Of sorghum there are small patches of Northern sugar cane grown as an experiment. Pears are very light, the most successful are Bartlett, Seckel and Sheldon. Apples are dropping badly, not more than two-thirds of a crop; most successful varieties, Greenings and Baldwins. Plums, large crop. F. D. C.

N. Y., Union Springs.—We are in the midst of our wheat harvest which promises to be much better than last year both in yield and quality; the average yield, I should think, will be about 20 bushels per acre. Barley, oats and corn are looking splendid, excepting those growing on the clay soil adjoining the lake, which have suffered very much for the want of rain. The average yield of barley I would place at 30 bushels; and of oats, at 50 bushels per acre. It would be difficult to make any estimate of corn at the present time. The acreage of each is about the same as usual. E. A.

N. C., San Souci, Bertie Co., July 12.—It has been very dry up to about July 1, causing a very short crop of oats and wheat. Late-planted corn and cotton came up badly, causing a poor stand; earlier-planted, however, are growing finely, and are in promising condition. There was plenty of bloom on cotton in the latter part of June, showing it to be several days earlier than usual. Worms have been very troublesome in corn, and replanting has been continual, which gives the crop a very uneven appearance. The prospect now is good for a fair yield of field crops. Gardens suffered badly on account of the long drought. J. C. F.

OHIO, Lancaster, Fairfield Co., July 10.—Corn is doing well; oats not very well—rusted in many places. Wheat is turning out not nearly so good as was thought before cutting. The rust, which was thought to be of little account, has made a good deal of shriveled wheat; and although there is a large crop of straw, there are a great many short heads; so that there will not be as much good wheat as last year. This applies to Pickaway and other adjoining counties, as far as heard from. There will be a good crop of apples and peaches; pears are very scattering. The cherry crop was very good. A variety called Dyehouse, a Morello, introduced from Kentucky about ten years ago, is making a fine record as an unfailing bearer; and notwithstanding its excellent quality, for some reason or other the insects let it alone. Blackberries, all over the hill country east and south of us, are in great abundance. Nothing in stock of any kind. J.

PA., Doe Run, Chester Co.—Wheat was ripe and ready for the reaper nearly two weeks earlier than I ever before knew it. Grass also was ready to cut earlier, and both are on hand at the same time. We in this section mostly get our hay in by the time the wheat is ripe. We have had fine harvest weather; but it is much too dry for corn, oats, and grass. The wheat crop in our county this season is middling fair; the late-sowed is rather light owing to the drought; we had no rain from the 30th of April till the 30th of May to do crops any good. The Army-worm did some damage to the wheat; notwithstanding that there is a small increase of acreage under the crop in this section, there will, I think, be no increase of bushels over either of the two last years. Oats promise to be rather light. The crop has suffered much for want of rain in the last two weeks, and is backward on account of dry weather just after seeding time; the white oats are mostly grown—no increase of acreage. It is now changing color and will be ready to cut soon. Corn is not as forward as usual at this time, it being dry all through May and the cut-worm injured some fields, so that an unusual amount of replanting was necessary. All corn on grounds plowed in the Fall or Winter was much less injured by the cut-worm than that on ground plowed in the Spring near planting time, and the corn seemed to grow better during the dry month of April on the winter-plowed land. In the fifty years I have been farming I never before saw so much difference in the corn in favor of Winter plowing as was manifest all over our section this season—no increase of acreage. But little barley is sown in this section. I have not seen a field of barley for ten years in this part of Pennsylvania. Rye is not much grown and what is raised is mostly for the straw; it looks well and is well-headed this season. The wheat grown in this section is largely of the Fultz variety, which is considered the most productive. Some still sow some Clawson, but the millers condemn it as not producing so much weight of flour to the bushel as other varieties. Red Mediterranean is coming into favor again since the Clawson has become unpopular. Several new kinds are being tried. Potatoes are largely cultivated in this section; the Early Rose has been quite popular for several years back, but does not seem to do nearly so well of late years. If planted late, particularly in dry seasons, they don't come up well, and I see many patches this year that have not come up half thick enough. The Peerless, Chili, Snowflake, and other new varieties that are being tried here, look well for this dry season; but the bugs are very numerous and require constant watching. I think from the present outlook the potato yield will not be good, yet we are now using good-size Rose potatoes that were planted on the third of April last. The acreage of potatoes is on the increase. Not nearly so much sorghum has been grown as there was some years back. There have been some experiments and a good deal of talk on the subject of making sugar from sorghum, Northern sugar cane, common corn, beets, etc. I have some Northern sugar cane and Silesian sugar beets growing, but expect to feed them to the cows. Several others are growing for the same purpose, unless a sugar-making establishment shall be got up in this section, like that near Wilmington, Del. As to fruit, apples promise only a middling crop; peaches are not very heavily cultivated in this section, and they will be a light crop on what trees there are. Cherries a very fine, full crop. Almost all varieties are doing well. Of berries—as raspberries, gooseberries, blackberries, currants, etc—very full crops set, but the worms destroyed a great deal of the gooseberries and currants by eating the leaves of the bushes. Pears are only a middling crop. The Bartlett and Seckel are amongst the best bearers and most popular here. Of apples a great many kinds are grown. The most popular variety at this time is the Smith's Cider, it being the best bearer. After repeated trials of many of the new varieties, farmers and orchardists find many of them poor bearers and are again coming to favor, the old Red Romarin, Gray Romanite, Pennock, etc., as being surer bearers than most of the newer kinds. J. W.

S. C. Aiken, Aiken Co.—After a five weeks drought, at last we have had a glorious set of showers wetting down three or four inches and saving the remains of the corn crop, etc; so now all is fresh, green, and glorious here. The dry time has shriveled up the Concord and other grapes. Peaches won't be anything, worth naming with me—they are *very* scarce indeed here. The "Cusco Corn" is in full tassel; but as yet I have not found an ear—not one. The RURAL Branching Doura is doing well; the dry time has put it back, but it is filling out—tillering out—finely and grows apace and I will try and keep it on that line all Summer. Watermelons have appeared on our street. Vegetables are excessively scarce; all dried up. On my strawberry bed about fully half the vines died out owing to the drought. I had berries for the table to the middle of June. We got more fruit from the Crescent than from all the rest of the bed together. The Sharpless did nothing. The Albany Seedlings came in a good late and brought up the rear well. The blackberry crop is a failure owing to the March frost and the later drought. S. O.

TENN., Dresden, Weakly Co., July 9.—Last Fall was very favorable for putting in a large wheat crop. The Winter being very wet and warm, and there having been but little freezing weather, wheat looked well until Spring. Then the drying winds began to tell on its growth, and it rusted badly. Now the thrashing

season is nearly over, and the yield is not over two bushels per acre. A good many fields are left uncut. The best yield is from land that was in cow-peas turned under, vine and all. Oats and rye rusted, and are short crops, and but little of either has been gathered. Of tobacco only half a crop was planted, and it is very late. Cotton, corn and grass are about an average acreage, and give fair promises of an average yield, if the weather keeps seasonable from this time on. The recent rain has revived the growing crops; gardens were failing until then. Wheat stubble is being prepared for stock. A good many farmers have finished sowing peas, and the land under this crop will, most of it, be sown with Fall wheat. Farmers will have to send to some other section for seed wheat, consequently there may not be as large a crop put in as usual. Three bad crops of wheat have disheartened a good many farmers. The cow-pea crop has excelled it so far as a paying crop; for peas sell readily at one dollar per bushel, and the vine that is left is a good fertilizer, and all other crops do well after peas. Apples, peaches and pears are each about half a crop. All small fruits are abundant. The potato beetle has made its appearance, and is devouring the crop, though the pest is a little too late to seriously injure the tubers, as they are pretty well made. But few are raised here for market, although our county will produce anything that is generally raised for the sustenance of man. We have rich grain and grass land, plenty of timber and water, as this county borders on Kentucky, midway between the Tennessee and Mississippi Rivers. P. A. C.

TEXAS, Cross Plains, Callahan Co.—Owing to dry weather our wheat did not come up until Christmas, and part of it was much injured by rust, the white varieties suffering most. It will yield 12 or 16 bushels per acre. Oats were injured by late frosts. Several pieces of millet were sown this year, and will make a good return. Potatoes were taken by the Colorado beetle. The few who are farming in this part of the county have splendid prospects for corn. As to fruits we have none as yet. I am raising the Early Amber sugar-cane which is now ready to work up; later varieties are looking well. Plenty of rain. F. P.

UTAH, Ogden City, Weber Co.—Wheat, oats, barley, rye, etc., in this county will only be about half a crop. There is also a very poor prospect for corn. Sorghum is not grown as extensively as it was a few years ago. Potatoes and the root crops are the most favorable, such as beets, carrots, etc. The peach and apricot are total failures in some places, but in a few locations a few may be raised. Apples, plums and pears are pretty good. Currants, strawberries and raspberries are very good—better than common. Gooseberries have been partly destroyed by mildew. Lucerne is abundantly grown here; we often cut three crops a year; this is our best fodder plant. The poor condition of the crops is due almost wholly to a late Spring and severe drought; we have only had one slight passing shower of rain in the last two months, making irrigation water very valuable. WM. J. H.

VA., Dunnsville, Essex Co., July 7.—We have had copious rains for ten days past, but we passed through the driest March, April, May and early June known to the oldest people. Gardens and early potatoes are almost entire failures. Wheat very short—not more than half our usual crop. Oats are nothing. Clover the same. Pastures very short, and cattle have to depend on the much-abused wire grass, the only crop that could stand the parching winds and drought. Corn is now looking first-rate, farmers have finished working it, and pastures are beginning to show their usual beauty at this season. Cattle, too, are beginning to improve; though this is not strictly a stock section there is quite a number of sheep, cattle, horses, mules, and hogs raised for market. It is a first-rate sheep country; all who engage in sheep husbandry and pay attention to it, double their capital every year, and some do a great deal better. Sheep cause very little expense here. South Downs seem best adapted to this section. The country is gradually recovering from losses, though there are still complaints of hard times, which, I suppose, are to be heard in other sections perhaps more blessed than this. Wheat sells at $1.05 to $1.10; corn, 60c for home demand; oats, none for sale. "Hands" hire from $10 to $18 per month. Land sells at $2 to $20 per acre, according to location, improvements and natural advantages. There is an abundance of fine streams. Transportation is first-rate, and the country very cheap and healthy. Doctors all complain of hard, dull times. OBSERVER.

W. VA., Kearneysville, Jefferson Co.—Wheat here will make three-quarters of an average crop—Fultz, Long Berry and Lancaster; average per acre 15 to 25 bushels. Corn looks well and has a larger acreage than last year. Potatoes look well, and will make a full crop; they are now worth $1.25 per bushel, in the market. Oats will not make more than the seed. Rye is very good. Plenty of cherries; of peaches but a few; apples a quarter of a crop; grapes a full crop, ditto all small fruits. J. A. H.

WIS., Stephensville, Outagamie Co.—There is not very much winter wheat raised in this locality. What there is, was badly winter-killed. Spring wheat looks fine, and more was sown than usual. The prospect for oats is good. That for barley, extra-good, but not over a quarter as much is sown as last year. A small amount of sorghum has been planted this year as an experiment. The fruit crop will be good. The crabs, Duchess of Oldenburgh, Red Astrachan, and other Russian apples have proven most successful. O. W. A.

WIS., Fort Atkinson, Jefferson Co.—The wheat crop at this time promises to be the best for years. Winter wheat is being cut. Rye a good crop. Barley a heavy crop—better than for ten years. Acreage of small grain one-third more than usual. Sorghum is raised generally, nearly every farmer having from a quarter to a whole acre. There will be an abundance of apples. D. W. C.

WIS, Cadiz, Green Co.—Wheat about half a crop—acreage about one-fourth larger than last year. Potatoes good—one-half more land planted to them than the year before. Oats, good—double the usual acreage. Barley good; area smaller than in '79. But little sorghum; orchards young and not much fruit. A. B.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

N. J. B., Severy, Greenwood Co., Kan., has built a bee house to keep the moths from the bees. It is described as being about 4x6 feet, and so arranged that the bees can occupy the whole space within. The entrance is about three feet from the ground, but still the moths are troublesome. Our correspondent asks for advice.

ANS.—From this meagre description we can scarcely form an idea of the house, but it does not seem to be at all practical. It appears to be one gigantic hive with a floor room of some 24 square feet, and the entrance situated three feet from the ground. Such a structure would rather favor than counteract the instincts of the moth. The relative hight of the entrance is of but little consequence since the moth can fly. There is but one remedy for the bee-moth and this consists in keeping the colonies as populous and vigorous as possible. A strong colony will repel the intruder and remove the larvæ of the moth that may appear on the comb, while a weak one will remain passive to all operations of the bee-moth. There are no moth-proof bee-hives. All hives that pretend to be such are humbugs and our advice is to leave them severely alone. A good movable frame hive, filled with active, buzzing Italian bees, is not greatly in danger of being infested with bee-moths. The apiarist will, of course, remove any occasional larvæ, that may be found on the combs, during the various operations of the hive.

Crossing Corn.

E. D. B., Grundy Centre, Iowa, asks if the White Prolific corn were crossed upon another variety with single ears, what would it make, and would the cross make more than one ear to the stalk.

ANS.—When stockmen breed to a color or quality they expect a cross of about half of each between two pure-bloods. For instance, a pure Short-horn crossed on a pure Jersey will give about a half Jersey and half Short-horn. This grade, or cross, naturally partakes of the qualities of both sire and dam in a greater or less degree, the precise degree depending mainly on the superior prepotency of one parent on the other. This natural law holds good in the vegetable kingdom as well. In crossing a pure variety of corn upon another, the grade, if we may use the term, partakes of the qualities of the grain that furnishes the pollen (male), and also of the qualities of that possessing the silk (female); therefore crossing the White Prolific upon a one-eared variety will increase the number of ears; change the quality of the grain and affect that of the cob and fodder in proportion as one may be stronger and more vigorous than the other.

Bitter Cream.

A. W. K., Searsport, Me., asks for the cause and remedy for bitter cream. All the cows are in fine health and have a good pasture.

ANS.—Bitter cream may be caused by the cow eating bitter weeds, as rag weed, boneset, willow leaves and twigs, etc. Or it may be caused by the cow being injuriously affected by the hot weather, or by impure water. Or it may be caused by a fungus growth in the cream when kept in a cellar that is not well aired or has anything moldy in it. Or the cream may be kept too long, or the churning may be too long continued. If the bitterness is supposed to be from any cause without the cow, a good pinch of saltpeter in each pan of milk may change it If it is within the cow give her half an ounce of saltpeter once a day, for two or three days; this will help to carry off the impurities through the kidneys. Other causes may be removed or prevented.

Miscellaneous.

L. W. S. Pitcher, N. Y., asks how to trim squash vines, and if they will produce better when trimmed; 2, the name of a plant sent us.

ANS.—Theoretically squash vines ought to do better when trimmed than when left to themselves. Pinch the tip of the young plant when it has four leaves. Spread the four branches that are thus produced at equal distances from each other about the plant. Pinch them again when about a foot long, and allow not more than two squashes to set on each branch. By judicious trimming, which can hardly be explained upon paper, seek to direct the nourishment to the fruits instead of to the production of vines, and when the ground is covered, allow no vigorous shoot that has no fruit to expend the strength of the plant. These same directions are also applicable to the care of melons. The number of fruits that can be grown on one plant will, of course, vary with the vigor of the variety. It is by just such care that European gardeners are enabled to produce from five to eight handsome melons under a single hot-bed sash. 2. Leonurus Cardiaca, or the common motherwort.

E. B., no address, asks where Seneca wheat originated, and whether it can be improved up to the standard of a specimen ear sent us, one he picked out of a lot; also, as to Fultz.

ANS.—The Seneca wheat is better known by the name of Clawson, and originated on the farm of Stephen Clawson, hence its name. Last year we planted Clawson (Seneca), one seed about a foot apart each way, and cultivated. The heads and grain were much larger and each plant tillered remarkably. We have raised Clawson for about seven or eight years, and our present crop, in spite of drought and Army-worm, is the best we have ever raised. We drill in 1½ bushel per acre. Neither the grain nor the heads of Fultz are as large as those of Clawson, though more compact. It is no better in quality, though in many parts of the West it yields more than Clawson. We have them growing side by side, though both are so fine that it would be hard to determine before harvest which will yield most.

D. J. A., Moore's Store, Va., says that the rose-bug there destroyed all the bloom of grapes, and asks whether there is any preventive or remedy, or any grapes that bloom earlier than the Concord or Catawba.

ANS.—On a small scale of grape-growing, the bunches may be inclosed in bags of mosquito netting, or other gauze, on the first appearance of the rose-bug, and let them remain till danger from that source is over; but on a large plantation this would, of course, involve too much labor, and would therefore be impractical. The application of whale-oil soap, and other remedies that are disagreeable to the insect, is of questionable advantage. These, as a general thing, do but little good as a preventive against its ravages, and applications that would have effect on so hardened a criminal as the rose-bug might work disaster to the delicate blossoms of the grape, and the remedy thus become worse than the disease. The varities named are among the earliest to blossom.

A. S. S., Waco, Texas asks for information as to the best time and manner to harvest Egyptian corn.

ANS—The time to harvest it is when the seed is in the stiff dough state. As to the most practical manner of doing the work we are not posted; for although we have grown several varieties of sorghum at the Rural Farm they have not been harvested with a view to economize time and labor. Will some of our Kansas friends who have had experience please answer.

L. D. Belmont, Nova Scotia asks, 1, the best way to apply lime to the land; 2, how far apart should tile drains be put in sandy soil; 3, the cheapest place to buy agricultural books in New York.

ANS.—1. Sow it broadcast in the Spring: the most effective amount to apply depends on many considerations but about 40 bushels to the acre are usually deemed sufficient, though in England they often use 300 to 400 bushels per acre. 2, It will depend upon the nature of the subsoil, and upon how near the water stands to the surface. Under ordinary circumstances about 40 feet would be close enough. 3, We know of no difference in price in first-class book stores. Publishers will be able to sell as cheaply as anybody.—The recipe asked for has lately been given twice in Domestic Economy Department.

S. W., Black Mountain, asks whether attaching bells to the legs of turkeys would be likely to prevent cats and foxes from attacking them.

ANS.—Putting small bells on old turkeys might keep off foxes and wild cats. The idea is a good one and worth trying; sleigh bells would do. But the difficulty with a flock of young turkeys would be that they would be hard to take care of unless fenced in till of a good size.

G. A. T., Warsaw, Ind., asks the names and use of a couple of specimen plants sent to us.

ANS.—That bearing flowers is Poa compressa—the Blue grass of the North. The foliage is rather scanty, but it is very valuable, nevertheless, thriving on poor land. It may readily be determined by its deep bluish-green color and compressed (flattened) stems. The other specimens, having no flowers, we cannot determine.

E. H., West Granby, Hartford Co., Conn., sends a plant for name, which he says is a good forage plant It is perennial, and grows in sandy soil.

ANS.—The name of this plant is Desmodium ciliare. It belongs to the Pulse Family, in which are classed so many of our useful cultivated plants, like peas, beans, clover, etc. It may have some value as a forage plant, but it is not cultivated for that purpose.

H. L., Bedington, W. Va., sends a specimen of smooth wheat found in a field of bearded wheat, and asks whether it is a sport.

ANS.—It seems to be the same as the bearded. We have found bearded and smooth from the same root. Beards, however, are often eaten off by insects. Sometimes they decay and drop off. The rubbing of one head against another will sometimes rub the beards off.

J. W. M., Newark, N. J., asks for some remedy against the small black flies and long green maggots, with black and yellow stripes, that throng his grape vines.

ANS.—Would require specimens of the "maggots." Tobacco water will kill the aphides. They prefer the tender tips of growing vines. These may be dipped into the tobacco water.

H. R. R., Atlantic, Iowa., wants to know, 1, when to sow honey locust seeds for a hedge; 2, the best time to sow Hungarian grass.

ANS.—Gather the seed in the Fall as soon as ripe, put it in layers with moist sand in a box and bury the box. Sow the seed early the following Spring. 2. In the Spring; for fall feed it should be sown at once.

A. M., North Hector, N. Y., sends a couple of heads of wheat, of a sort he picked out of lots of Clawson three years ago; last Fall he planted seven bushels of it; it looks fine, and he asks its name.

ANS.—It is nearer to Clawson than any other variety with which we can compare it If the grain and head were mature, we could determine better.

R. J. S., Ithaca Mich., asks for some remedy against the worms that destroyed his currants and gooseberries.

ANS.—Shake and pick them off onto a sheet and destroy them, or dust hellebore on the plants. This material is poisonous, and if used care should be taken that none adheres to the fruit when gathered.

G. E. N. Afton, N. Y., sends a grass for name, and he asks where the Cook evaporator is made.

ANS.—1, The grass is Meadow Fescue—Festuca pratensis. It ripens seed very early and, of course, gives early pasturage. It does well on dry land. 2. The Blymyer M'f'g Co,, Cincinnati, O.

F. K. P., Delevan, Wis., asks for a remedy against the Cabbage worm.

ANS.—We know of nothing better than hot water. This may be put in a watering pot, boiling-hot and sprinkled upon the plants through the rose. Pepper has been recommended.

L. A., Port Claborne, Ont., Canada, asks whether Boyd's Electric Pad is of any use for healing purposes, as claimed for it in numerous advertisements.

ANS.—No; the thing is a downright humbug, as we have already stated here two or three times.

C. A. B., Chelsea, Mass., asks if cow-peas are good for eating green.

ANS.—Some varieties are used for that purpose in the South; but they are not likely to be a popular food for the genus homo where toothsome garden peas and beans are at home.

F. E., Fairview, W. Va., asks which is preferable for sowing wheat—freshly plowed ground, or that which has been plowed some time.

ANS.—We should prefer the former.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JULY 24, 1880.

ANNOUNCEMENT.

The next Fair Edition of the Rural New-Yorker will be issued about September 1st. Instead of 28, as in our last Fair number, it will consist of 40 pages with cover, original engravings and articles written expressly for it by Dr. J. B. Lawes, of Rothamsted, A. B. Allen, William Robinson, founder and editor of the London Garden, Professor F. H. Storer, Peter B. Mead, Gov. R. W. Furnas, Prof. E. W. Stewart, B. F. Johnston, Henry Stewart and by others perhaps whose names we are not at present prepared to announce. It will contain a full account of our next Free Plant and Seed Distribution which we deem of greater value than any previously offered. It will contain our Premium List for 1881 together with other matter which it would be premature further to particularize now. Respectful notice is hereby given to advertisers that we cannot insure the insertion of advertisements in that number unless the copy is received before August 15, or possibly August 10th. We *guarantee* that the edition shall be over 75,000 copies. How much over we are not prepared to state as it will be printed from electrotypes and distributed as needed during several months. The greater part of the edition, after serving our subscribers, will be distributed at the most important of the Fall fairs. Our regular subscribers are freely invited to send for as many copies as they may be willing to distribute among those who are interested in rural affairs. All the friends of the Rural New-Yorker, who are satisfied with the efforts we have made to please and instruct them, are solicited to aid us, through this Fair number, in so extending our circulation that further improvements may be inaugurated and sustained during 1881.

Subscribers of the Rural New-Yorker will greatly oblige us if they will promptly notify us of any irregularity in the receipt of their papers. The many changes rendered necessary by our removal and an unusually large number of complaints make us desirous of rectifying any further derangements at present unknown to us as speedily as possible.

Presidential Candidates. — Again, the farmers do not seem to have made their voices heard in the late selection of candidates for the Presidency or Vice-Presidency. We are sorry that this is so, and that the one overshadowing interest of our country should ever be hidden from sight during the political intrigues that select the men for whom we must vote, or not vote at all. We can mention not less than six contributors to our columns to whom we should give our vote in preference to either of the Generals that have been chosen.

The Silver Dollar.—Attention has often been called to the essential inconvenience of the new silver dollar; and from the comparatively small number that can be kept in circulation it is plain that most people find it too heavy and bulky a coin for daily use. For a forcible presentation of this idea we have met with nothing more emphatic than the remark of a farmer's wife which we chanced to overhear recently. "*Stove-covers*! I call 'em," was her dictum; and the figure lost none of its strength from the contemptuous, strident tone in which it was uttered.

Horticola.—Who is he? We have already had this inquiry and probably, as soon as the force and spirit of his "Ruralisms" become apparent, others would like an answer to the same question. "Horticola" is one of our oldest horticultural editors and one of the few who, having experiment grounds, is enabled to write of things as he sees them. We engage him to write for the Rural New-Yorker and to tell the whole truth, regardless of any individual interests. That he may do so without incurring the personal displeasure of those whose plants or acts he may criticize or condemn; that he may write with the utmost freedom, it is better, perhaps, that his familiar name should at least for the present be withheld.

BETTER RATHER THAN MORE DAIRY PRODUCTS NEEDED.

The immense foreign trade in dairy products, attaining the largest volume ever reached last year, is pretty well sustained the present season. In three years the increase in cheese exports was 45 per cent., while a more than sevenfold advance in shipments of butter was made. The quantities exported were 141,654,473 pounds of cheese and 38,248,016 pounds of butter. In the ten months of the present fiscal year to April 30, these exports are respectively 97,122,753 and 31,144,806 pounds. The average value of the cheese was 8.9 cents per pound and of the butter nearly 17 cents, an improvement of 3½ cents on last year's prices, but still lower than for any former year since 1862. This is an absurd price, indicative of quality quite unworthy of American reputation for skill, being only two-thirds of a cent per pound for milk, and if the expenses of manufacture and freight are considered, it is a little more than a cent per pound for the milk in the hands of the farmer. It is true that a low grade of goods goes to foreign markets as a rule, yet there is a vastly larger quantity of equal worthlessness disposed of at home. The gap between grease and gilt-edged forms the abyss that yawns between loss and profit in dairying.

WHAT SHALL THE BOYS DO?

The very basis of the healthful progress of any nation or country is the practice of some mechanical industry by the majority of the men. A certain proportion may earn a living in commercial pursuits or in the professions, and some may procure a living as saloon-keepers, bar-tenders, loafers and tramps. But very few can be supported in idleness or in vice without laying a weary burden upon the industrious classes. Of late years a serious social danger is threatened by the action of the various trades' unions in refusing to admit boys into shops as apprentices. Some years ago there was a class of apprentices in every large shop or factory, and in time these boys became skillful workmen. Now the supply of such artisans is cut off at the very source, and the consequence must be (and is, for we are all discovering it in the most palpable manner) inferior materials and workmanship in nearly every tool and machine that is purchased. "The farmer pays for all," not only for inferior work of untrained artisans, but for the support of idle boys and the vicious, dangerous men that idle youths must invariably become in time.

Fortunately there is one industry into which every boy will be welcomed. There is scarcely a farmer in the land who is not prepared and ready, nay, eager, to accept the services of an apprentice for such a remuneration as his labor may deserve. Board, clothes and a little spending money he is ready to give, and, in addition, to teach him the practice of his art, which is certainly as intricate as sawing wood or hammering iron. There are no trades' unions on the farm. The farms will receive all the boys that workshops refuse, and the boys will have no cause in the end to regret the ill-nature and selfishness that drove them there.

EUROPEAN CROP REPORTS.

The latest European crop reports by cable indicate that, although the harvest everywhere, except perhaps in Russia, will be considerably better than that of last year, yet the brilliant promises earlier in the season will be realized only in a few places. In the British Isles heavy rain storms have lately been damaging the crops, and the area under wheat is less than usual, mainly on account of the farmers' discouragement at the failure of the crop for the last three or four years, and at the close competition with cheaper grain from this country. In France crops are a fair average; in Germany, the prospect for harvest seems bad in places, but middling-fair on the whole; Russia seems to have the poorest crop outlook of all our transatlantic friends, and will have only half her usual surplus of cereals for export. Austria-Hungary will have good crops; and so will Italy. It is certain that Great Britain will be a heavy importer of foreign grain; and nearly certain that France and Germany will also be considerable purchasers in our cereal markets; while Italy, Spain, Holland and Belgium will most likely also need some of our surplus wheat.

Owing to the high prices for wheat of late and the prospect that they might at any time fall considerably on the expected collapse of the American syndicate, both English and French dealers and millers have been doing only a hand-to-mouth business in that cereal. They were certain prices would not go up, and hopeful they would come down, and accordingly refused to keep any stock on hand. Again, the high figures tempted European holders of grain to sell all they could possibly spare, so that now the unmarketed supply is unusually small. Accordingly on account of the very small amount of last season's wheat in the hands of the producers and dealers, and the constant demand, increased by the late fall in price, prices across the water are now stiffer than a couple of weeks ago, and will, not unlikely, remain so at any rate until the present harvest is fully in the market.

FARMERS TO THE RESCUE!

At this season of rural plenty, when farmers throughout the land are rejoicing over splendid crops nearly everywhere, they should not for a moment permit brother farmers in any section to suffer for the necessaries of life through unavoidable mischances. When in any part of the country the members of other callings are hard-pinched, either through "strikes," slackness of work or for any other cause, their fellows all over the country are accustomed promptly and liberally to come to their relief. Shall farmers be less generous than artisans; or less considerate of the needs of those of their own avocation whom misfortune oppresses? The couple of tiers of counties along the western border of Kansas are newly and very thinly settled; the settlers, as a rule, expended their little all in the first year's expenses trusting to the hoped-for harvest for future support: owing to the drought that scorched that section in Spring, crops have been nearly total failures this year, nor were they much better last season. The people are close to absolute starvation. Owing to the distance apart of the miserable homesteads and the general poverty, neighborly help, either in the form of relief or remunerative work, is impossible. Through 16 counties gaunt, famishing families—helpless children and women and men equally helpless—must depend until next harvest on outside charity for support. The Kansas Aid Society, organized at Topeka, Kansas, appeals to the people of that and other States for help for these hungry pioneers of civilization who have been unwisely tempted to invest everything in the arduous task of reclaiming the "Great American Desert." It is to be hoped that this appeal will meet with a generous response from farmers all over the country.

AGRICULTURAL COLLEGES.

An ill return was made to the Michigan Agricultural College recently. Prof. Kedzie, the professor of Chemistry of that College, has for some time past been making some elaborate tests of the value of certain wheats, chiefly for the purpose of removing an unjust and costly discrimination against Clawson wheat by the Western Millers' Association. The millers were prejudiced against this wheat to the extent of 10 cents a bushel; that is, they charged that to that extent it was inferior to other wheats for making flour. It was never known that they sold the flour for any reduced price, but it was known that when a farmer came to a mill with a load of Clawson wheat he was "docked" precisely 10 cents a bushel off the regular market price. As Clawson wheat yielded well and was a safe and profitable kind to grow, this annoyed the Michigan farmers considerably.

Prof. Kedzie, in their interest took up the matter and by his careful, thorough and laborious work during several months proved to the millers that Clawson wheat was equal to any other, and induced them to withdraw their unfavorable discrimination. Thus he saved 10 cents a bushel on the crop of every Michigan farmer, and this was equal to 10 per cent. of the aggregate product of this wheat, and nearly every field was sown to this kind. If 1,000,000 bushels of this wheat were grown in Michigan, the difference to the farmers of the State was precisely $100,000 every year. But doubtless there were 5,000,000 bushels of this wheat grown in Michigan, and the saving would then be a round $500,000. But Clawson wheat is grown everywhere, and is a favorite kind from Long Island to the muddy Mississippi, so that the saving in the aggregate to American farmers must have been great; in fact, "there's millions in it."

But did the farmers recompense Prof. Kedzie? Did they present him with a testimonial, or even bestow a poor leather medal upon him? No. On the contrary, they rewarded him with conspicuous ingratitude; for when his College requested of the Michigan Legislature, in an humble fashion, as is the wont when appropriations are asked for agricultural purposes, that a small allowance be made to procure needed apparatus for the chemical laboratory to further extend its usefulness the modest sum asked for was refused. And yet the chemical department has saved the farmers this year half a million dollars.

From this plain tale two morals are to be drawn: First, agricultural colleges *are* of some use to the agricultural public; second, it is somehow or other in the nature of things that the most valuable public services are not always the most generously rewarded. If there is anywhere one agricultural college that has deserved generous treatment it is that at Lansing.

BREVITIES.

We call attention to the article by Prof. E. Gale, page 470.

We call the attention of our readers to the article by Mr. W. I. Chamberlain, which seems to us of some importance to pomological interests.

Concerning the Tea Problem, Gen Le Duc writes us, "I can safely write and announce that it is a full success, *quod erat demonstrandum*. Tea made from American-grown leaf, submitted to the best judges in New York and London, passes muster with the highest-priced India teas."

It is now time to set out celery plants for Winter and Spring use. The two systems—trench and surface setting—are variously opposed and commended. We are of opinion that a shallow trench is better than either extreme—a trench say three inches deep. Then plant in the bottom of that the same as if it were the surface. But whatever the plan pursued, the ground should be rich and mellow, and, above all, the plants should not suffer for moisture.

It will be seen by reference to "What Others Say" that the the First Annual Report of the Cornell Experiment Station is one that should be read by all farmers. Not less valuable than the experiments of Prof. I. P. Roberts are those of the Director, Prof. G. C. Caldwell, to which it is our intention to refer as soon as space permits. The report consists of 135 pages, and may be secured by inclosing to the Secretary, W. R. Lazenby, Ithaca, N. Y., 30 cents which barely pay the cost of publication.

Jersey Island Annual Agricultural Show.—This came off the 27th May. A large number of animals were exhibited, but very few purchasers were present. We are surprised to observe that in the reports of this show in the English papers they are confined almost entirely to remarks on a goodly form of the animals and their colors, and not a word is said as to their milk or butter production. We are fast getting over the nonsense about the color of the hair of the Jersey cow on our side of the water, and are beginning to give the highest prizes to such cows only as prove the greatest butter-makers, leaving their color entirely out of consideration. If a fancy color and extra-fine form accompany superior butter production, it makes the animal, of course, the more desirable, and she will bring a higher price on that account; still these have now become only secondary considerations with first-rate breeders.

There is a good deal of agitation in England just now about the restrictions on the importation of cattle from this country, and two members of Parliament have given notice that they will soon call up the subject for discussion in that body. There is considerable doubt about the real nature of the disease which the inspectors have of late detected in some of the animals landed, and called pleuro-pneumonia. Many insist that it is not genuine pleuro-pneumonia, but merely an ailment nearly similar in appearance, which has been engendered by the hardships of the voyage across the Atlantic coupled with the antecedent rough usage to which cattle are generally exposed here during transportation on railroads. In any case, the number of affected cattle that have lately been landed is comparatively small; out of 30,817 head landed from the United States in London during '79, only 38 are reported to have been affected in any way with pleuro-pneumonia.

Who can read the rural journals and yet not feel that improvement is constantly being made in the earliness, or lateness, fruitfulness or quality—one or all—of our fruits and crops in general? And yet when carefully investigated, it is found that the instances of actual advancement are very few. Several years ago we reported from careful tests that the Philadelphia Early was the earliest of green peas. Since then, a number have been introduced that were said to be earlier and yet, according to the recent tests of Cornell University the Philadelphia is still the earliest. How many "earliest" tomatoes have been advertised during the past five years? And yet Hathaway's Excelsior, Canada Victor, Conqueror and Arlington are as early as any. As we have said before, all advances in this direction when they have occurred are at the expense of quality. We hope the day is not distant when the public will look with indifference upon all efforts to introduce fruits or vegetables when the chief merit is "superior earliness."

Literary Miscellany.

THE FARMER FEEDETH ALL.

My lord rides through the palace gate,
My lady sweeps along in state;
The sage thinks long on many a thing,
And the maiden muses on marrying:
The minstrel harpeth merrily,
The sailor plows the foaming sea,
The huntsman kills the good red deer,
And the soldier wars without e'en fear;
But fall to each whate'er befall,
The farmer he must feed them all.

Smith hammereth cherry red the sword,
Priest preacheth pure the Holy Word;
Dame Alice worketh 'broidery well,
Clerk Richard tales of love can tell:
The tap wife sells her foaming beer,
Dan Fisher fisheth in the mere:
And courtiers ruffle, strut and shine,
While pages bring the gascon wine:
But fall to each whate'er befall,
The farmer he must feed them all.

Man builds his castles fair and high,
Wherever river runneth by;
Great cities rise in every land,
Great churches show the builder's hand;
Great arches, monuments and towers,
Fair palaces and pleasing bowers;
Great work is done, best here or there,
And well man worketh everywhere;
But work or rest, whate'er befall,
The farmer he must feed them all.

A ROMANCE.

"Ye should hae telt me that in time, Jamie—
Ye should hae telt me that lang syne, laddie."

The singer's rich contralto had reached thus far, when, by an inadvertent movement, down came the music-book with a loud clatter upon the keys, causing the quiet whist-players, from their remote corner in Mrs. Bland's large drawing-room, to look round in amazement.

"I think, after such an indignified interruption, we will not attempt 'Huntingtower' again; at any rate not this evening," said the fair singer, May Denton, laughingly.

"As you please," said her companion, stooping to recover the fallen music, and placing it again before her. "It is an especial favorite of mine lately," he added, in a low, meaning voice, the earnestness of which brought the color in a sudden rush to her cheeks.

"But you cannot justify Jamie's behavior," said she, lightly, to cover her confusion.

"He wished to try Jeanie's truth, and well she stood the test," he answered. "Is there one that would be true to me, it may be through years of waiting,—to me, with neither St. Johnstone's Bower nor Huntingtower to offer?"

"What is the next piece on your programme, young people?"

The question thus suddenly breaking in upon them came from Mrs. Bland. Unperceived by the pair at the piano, the game had concluded, and the whist-players were dispersing. Although the room was partially lit, it was only twilight, and the lovely evening seemed to draw the party like a magnet to the veranda.

"Let us listen to the cool plash of the waves instead," said Clay Nelson, regaining his composure. "It is the finest music on an evening like this."

Drawing a settee to where May had seated herself, half in and half out of the low window, he placed himself where he could gaze unperceived at the lovely profile, delicate and clear-cut as a sculptor's marble, thrown out to perfection against the darkening blue of the sky. For a short time the only sound that broke the silence was the faint ripple of the sea, and the plash of an oar as a boat slowly glided by.

But presently a woman's voice was heard, loud and harsh even in the distance, and two figures advanced up the long parade, halting opposite the veranda, and drawing May's attention towards them.

"There is that remarkable looking woman again, with the little boy. I wonder if she is under a vow never to wear anything but an immense scarlet shawl over a blue-and-green plaid dress? Did she not resemble a materialized rainbow this morning, Mr. Nelson?" Turning to him for an answer, she found, with momentary surprise, that he had left the room.

"No one seems to know who she is," said Mrs. Bland replying to her question in a general way. "But she is evidently not a lady."

Meanwhile the object of their remarks had moved hastily away, apparently to join some one, though whom May, from her position in the veranda, could not perceive. The evening wore away, and the party were dispersing to their different rooms, when Clay again made his appearance, just in time to hand May's candle to her, and open the door.

"We finish the duet to-morrow, remember," said he, pressing her hand in a lingering "good night!"

Cliff House, the residence of Mrs. Bland, faced a bold line of seacoast, sheltered behind by the towering cliff from which it derived its name, possessing a lawn and tiny grounds on the southern side, it was eminently suited for the purpose for which, ten years ago, it was taken by Mrs. Bland—that of a boarding-house. It seemed to meet all requirements; a carriage-drive reaching to a well-covered portico, a spacious drawing-room opening on a veranda, a large dining-room from which could be obtained a view of the harbor made it available alike for invalids, to young people to whom the "see and be seen" phase of seaside life was by no means objectionable, and gentlemen to whom the shipping afforded a ceaseless topic of conversation over their wine and walnuts.

Great as these advantages were there was however one that yet outbalanced them all, and that was herself, the charming hostess.

Let the season be what it might, visitors few or many, Cliff House was always full. She petted the invalids, arranged pic-nics and lawn-tennis for the young people, listened to the interminable stories of Major Cook, always beginning with "When I was in India," with untiring interest and amiability.

Moreover, she generally had an affair on hand among her guests, the happy termination of which in a wedding was in great measure due to her consummate tact, she being well aware that a character for matrimony told rather for than against the success of her establishment.

However differently society at Cliff House might have employed itself during the day, it always assembled in the large drawing-room in the evening. Whist held silent sway at one end, music and singing at the other. Although the chandeliers were lit the Venetians were frequently left undrawn, allowing all who liked to remain on the veranda, and enjoy the cool breeze of the Autumn evening and the sight of the moonlit sea.

Such was the home to which May Denton and her guardian, Major Cook, had come about twelve months previously, a few weeks before the arrival of Clay Nelson, whose general characteristics had sorely puzzled Mrs. Bland. Handsome and commanding in person, reared apparently in the lap of luxury, brought up to no profession, it was yet evident that he had made aquaintance with poverty. On his arrival he had entered the field of literature—donned "the uniform of foolscap," as he half-satirically, half-bitterly termed it. Perseveringly struggling on, burning much "midnight oil," he hoped in time to win his way as an author.

"Ye should hae telt me that in time, Jamie—
Ye should hae telt me that lang syne, laddie."

So blithely sang May Denton the next morning, as she snatched up her garden-hat for a stroll in the grounds after breakfast.

Gayly she was proceeding, her hat still in her hand, when from a sort of cave in the cliff just above her came a voice that set her pulse bounding.

"It is of no use, Caroline, we go over the same ground again and again; you know what your allowance is, and must not forestall it. Besides, it is quite sufficient."

The words were spoken in a cold, stern tone. The reply came before they were well out of his mouth.

"Sufficient!" she echoed, in a loud, harsh voice, trembling with passion—"sufficient for a wife and child! This is *your* doing; you want me out of the way."

"You need not excite yourself so, Caroline," came the words, colder and sterner than before. "Here is the money, and here."—writing on a leaf of his pocket-book—"something more than your usual allowance for the child, as you say you need it. You know the conditions on which it is given you."

Muttering in what sounded like a foreign tongue she greedily grasped the packet held out to her and flinging her red shawl over her shoulders, turned to go. Her coarse dark beauty fell on May Denton's gaze as she stood perfectly chained to the spot.

She watched the flaming garment fade gradually in the distance, and the tall, straight figure of Clay Nelson recede in an opposite direction, lingering as if waiting for some beloved object he fain would see. How long she remained under the cave she never knew. Too stunned to move, almost to think, she lay on the cool ground like one in a trance.

At length, however, it became necessary for her to return; her absence probably unnoticed at luncheon was not to be thought of from the dinner-table; and feeling that the light of her life was gone, that henceforth she would rather die than live, she slowly moved away. To have loved, and loved like this! Oh! the horror, the shame of it!

To her great relief Clay Nelson's chair at table was vacant, but he joined them soon after in the drawing-room. Making his way at once towards May, he said;

May I ask you to sing my favorite song again, May? Shall it be as a solo or a duet?"

"It shall be neither, Mr. Nelson," said she, in a cold, hard voice, drawing her slight form to its fullest hight; "and I must beg you to remember in future that my Christian name is reserved for my *friends*."

For a moment he gazed thunderstruck, mingled love and surprise struggling on his fine features. Then pride came to his aid, and he turned away with a cold "As you please, Miss Denton."

Heart-sick and weary she sought her room that night with the words of the unfinished song haunting her brain.

"Ye should hae telt me that in time, Jamie—
Ye should hae telt me that lang syne, laddie,
For had I kent o' your fause heart
Ye ne'er had gotten mine, laddie."

. . . . . .

It wanted two days of Clay Nelson's departure from Mrs. Bland's. The morning, hitherto wet and cloudy, had suddenly cleared, and a breeze, that threatened ere nightfall to become a gale, had sprung up.

Luncheon was just over; the ladies had dispersed, but the gentlemen still lingered, watching the huge foam-crested waves.

"That lady must be remarkably fond of boating to brave such a sea as that," observed Major Cook to Captain Brayshaw, an elderly naval officer, and latest arrival.

He made no reply, beyond anxiously scanning the onward career of the tiny bark through his telescope. By its powerful aid he could descry the child who, with the boatman and lady, formed the sole occupants, leaning over the side apparently trying to obtain a piece of seaweed as it floated by,

"Good heavens!" he exclaimed, flinging down his glass. "The boat has upset!"

Clay Nelson, his face white as the handkerchief he held, rushed from the room towards the beach closely followed by the others. Meanwhile the accident had been perceived on all sides; there was an outcry and a rush to the boats, which were put off in all directions, sturdy arms rowing with might and main to reach the three struggling figures that now rose, now disappeared. Once, twice the woman and child were seen to rise, but before help could reach them they sank to rise no more.

Amidst the terror-stricken crowd that thronged the shore stood May Denton. Her face, white and quivering, was turned to where Clay Nelson stood with lips compressed and eyes strained towards the boats.

"Mr. Nelson," she said, in a hoarse whisper, "can you stand thus, with your wife and child drowning, and not try to save them?"

"My wife and child!" I do not understand you, Miss Denton."

"Not understand me! Are you so utterly false? Ah! you do not know that I was a witness of one of your meetings at the cave under the cliff!"

Suddenly through the dark trouble of his face came a gleam almost of joy.

"Then that was the reason of your altered behavior, your caprice and heartlessness as I thought, that in another day would have sent me forth. my faith in woman gone forever! May, my darling, meet me by the cave this evening, and I will explain all."

Pale and trembling, but with a feeling as of a burden being lifted from her shoulders and a weight from her heart, she returned to the house.

"You have heard me speak of Fairfield, May?" said Clay Nelson, as they paced the cliff together some hours after the sad catastrophe.

She bent her head in assent.

"Fairfield Hall is the residence of my uncle, and until the last five or six years mine as well. Brought up as heir-presumptive to the estates, I followed no profession, and never once dreamed of entering the crowded field of literature for ought save my own amusement. About that time my uncle, then on the verge of seventy, went abroad to recruit his failing health, intending to pass the winter in the South or Spain. Judge of my surprise, when he suddenly returned, bringing with him a bride! And such a bride! How or where he met her he never told me. My own idea is that she was a Spanish gipsy. In spite of her beauty it was evident that her origin was of the lowest. A few months sufficed to show that she was totally unfit in every way to reign as mistress in such a place as Fairfield Hall. You have seen her, and can judge in some measure the sort of wife my uncle chose.

"For the boy's sake, the heir to the title, he did not utterly disown her. He engaged a residence for her at the west, which she held under certain conditions, and my uncle deputed me to watch over her and the young heir—not by any means a light task, as, if you overheard our last interview, May, you must have gathered. In another month the boy would have been placed in other hands. Have I anything more to say, or have I explained to your satisfaction, May?

"And I doubted you, Clay! Oh! forgive me."

"Appearances were against me, but the cloud has cleared.

Six months later, and the village of Fairfield is *en fete*. The cause of the festivity is the return of Clay and May Nelson from their honeymoon.

On the spacious terrace of Fairfield Hall, facing the assembled tenantry and villagers in gala attire, stand May and her lover-husband. Close behind them are Major Cook, the bride's guardian, and Mrs. Bland. The latter, fascinating as ever, has lately listened to the gallant Major's stories with such deference that he does not despair of winning the charming widow in the end.

May, though new to her position, is already gaining golden opinions. With her hand on her husband's arm, she smiles and bows in answer to the repeated cheers, and turning her beautiful face towards him, says softly:

"'Saint Johnston's Bower and Hunting-tower.'"

With a look of love he answers:

"'And a' that's mine is thine, lassie.'"

RECENT LITERATURE.

Bullion, Its Production and Use: New York, Bullion Pub. Co., 52 Wall St.

This is a semi-monthly review treating of the subject which the title indicates. A personal review is recommended as the best means of obtaining an accurate knowledge of its contents. We give the introduction which will enable the reader to form an idea of its merits. "The object of this work is to furnish in most convenient form, the most complete and reliable statistics of the production and use of gold and silver, both for ready reference and as a basis for the intelligent consideration of precious metal mining. It will be seen that the contributors to Bullion, from the columns of which this compilation has been made include the highest authority in the world, on the subject." This production has now taken the form of a weekly journal, thereby presenting its subjects in greater freshness.

Ballads and Lyrics. Selected and arranged by Henry Cabot Lodge. Boston, Houghton, Osgood & Co.

We quote from the preface: "This collection is intended for boys and girls between the ages of twelve and eighteen in our public and private schools. The main purpose of the book is educational. It is designed to breed a liking for good poetry, and to suggest more extended reading in the works, both in prose and in verse of the best authors. The Lyrics which have been selected are, as far as possible, the simplest of their kind both in form and in idea. The collection will fully serve its purpose if it tends to develop a taste for good poetry, or if it helps to open to children the splendid and unbounded resources of literature."

MAGAZINES FOR JULY.

HERALD OF HEALTH.—Contents: Common Mind Troubles; How to Feed Infants; Favors—Fulfillment—Our Forefathers—In Health and in Sickness; Strongest Man in the World; New Method of Prolonging Life; Habits of Bancroft the Historian—Degeneration—Food and Man; Record of Hygienic Progress; Cradles; Macaroni and Vermicelli—Pie—Cheap Frying-Pans; How to Live in Summer—Swimming all the Year—An Appreciated Wife Remembering Injuries—Manners; Woman's Conversation—Current Literature; Health Foods.

SWIMMING ALL THE YEAR.—A lady writing to the Providence Journal on the art of swimming, says: "Everywhere in Europe it is becoming the custom for girls to swim as well as boys. At Trouville, Etretat and other places in France, and at Civita Vecchia and other watering places in Italy, I have seen princesses swimming day after day as ably as the swarthiest fishing girls. In this matter of swimming," continued the writer, "the banks of the Serpentine, in Hyde Park, London, upon a warm evening, are an apt illustration or thoughtful indulgence for the boys. At a certain hour in the evening one bank of the Serpentine is crowded with hundreds of boys, eagerly watching for the signal to be given for bathing by the authorities on the opposite bank. They stand with everything stripped off except what decency requires, and at the signal the scanty remnant of raiment drops from each as if by electricity. A mad scamper and plunge, and the water is alive with rollicking boys. At another signal all must retire to give place to another crowd of impatient swimmers. The agents of the Royal Humane Society are at hand to prevent accidents, and the police see that good order is preserved. The Upper Thames, also, is the happiest stream in the world, and the manly forms and magnificent color of young Englishmen attest the benefit of the swimming and boating of the summer season. In London, Brighton and other English cities, and in San Francisco there are fine swimming baths for both sexes, which are open for the greater portion of the year. The water in many of them, both in Brighton and San Francisco, is slightly warmed by steam during the cooler months, so that a good swim may be enjoyed as well during the winter as the summer. The London baths are centrally located, are of one story in hight and prettily designed.—Herald of Health.

ECLECTIC MAGAZINE.—Contents: Steel Engraving—The Frown; The Gospel of Evolution: Morocco and the Moors; The Pinch of Poverty; Henri Murger; De Profundis; An Escape for Life from a Fijian Cyclone; White Wings: a Yachting Romance; From the Cradle; The Grievances of Women; A Plea for Musicians; Recent Science; Cymbeline in a Hindoo Play-House; Daltonism; The Regicides of this Century; An Anecdote of Instinct; Fleuss's Method of Breathing Under Water; Literary Notices; Foreign Literary Notes; Science and Art; Varieties: Winged Words—The Bedroom—Democracy.

GOOD COMPANY—NUMBER TEN.—Ellen W. Olney contributes the leading story in Good Company, Number Ten. Two others are entitled Penance Extraordinary and Interpositions of Providence. Under the guise of a fish story Mrs. L. W. Champney happily hits off in her usual vivacious style various theological isms.

Another contribution tells of "isms" in a place which was once badly given to them, Seneca Falls, including the origin of the Bloomer costume. It seems that Mrs. Bloomer was not the first to wear it, though it took its name from her.

E. S. Gilbert has a most seasonable study of nature, Along the Brook; George M. Towle writes of The Three Emperors; there is an account of an interesting historical collection of wax-works in Westminster Abbey (how many persons, travelers even, knew wax-works were one of the sights of Westminster?); Contributions from Mrs. Edward Ashley Walker and Miss Catharine Carrington; poems by Dora Read Goodale, T. S. Collier and Walter Learned; and the pros and cons as to decorating confederate graves.

An article in the Editor's Table rejoices in the cheap books now so plenty, and expresses the opinion that in the long run they will tend to promote the sale of bound books.

BRIC-A-BRAC.

"Don't you dare to kiss me once,"
She cried with blazing eyes
At John, who felt himself collapsed
To half his usual size.
"I won't," he said, "please pardon me,
And I will be so nice"—
She smiled, and said, "Dear John, I didn't
Say you shouldn't kiss me twice."

"How far is it to Club Creek?" asked a traveler of a Dutch woman. "Only shoost a leetle vays." "Is it four, six, eight or ten miles?" impatiently asked the stranger. "Yas, I dink it is," serenely replied the unmoved gate-keeper.

Take her up tenderly,
Fashioned so slenderly,
Young and so fair;
Handle her carefully,
Talk to her prayerfully—
She's cross as a bear.
—Rochester Herald.

IT IS to be hoped that mosquitoes will use the telephone this year.—New York Herald.

BREATHES there a man with soul so dead
Who never took butter and sugar on his bread
In childhood?
There doth, although the confession comes hard,
'Twas the fellow who choked on oleomargarine lard.
In childhood.

A MUSICIAN, George Sharp, had his name on the door thus: "G. Sharp." A wag of a painter who

knew something of music, early one morning made the following undeniable and significant addition: "Is a flat!"

THERE was a young man in St. Joe.
Who was a perfect oracle, you know,
They gave him no rest,
So he done the next best,
(Emgirated out west)
And now he has learned to go slow.

THAT man is indeed "hard up" who cannot get credit for even good intentions.

A DIFFICULT CONUNDRUM.

"Do you know, my dear Herr Guldenstern, that there is something very mysterious about you? We have been acquainted with one another for twenty-five years, at least, and I have not been able to solve the mystery yet."

"What may that be?"

"My dear Guldenstern, I should like to know who wears your clean shirts?"—German Paper.

THE farmer feeds the bleating u n,
The sailor sails the c e,
The gardner plants the p p, he does,
The printer takes his e e,
The stuner wipes his weeping i i,
The farmer swarms his b b,
The printer dally sets his m m,
The teamster yells his g g,
The lawyer gathers his v v,
When he has tried his k k,
The sheriff's ever on the c c,
The gambler risks his a a.

At a camp-meeting last summer a venerable sister began the hymn;

My soul be on thy guard;
Ten thousand foes arise.

She began too high. "Ten thousand," she screeched, and stopped. "Start her at five thousand!" cried a converted stock-broker present.

MISS KATE.

Miss KATE's a member of the choir,
But often comes in late,
And in the chorus sings so loud
That she's called coruscate.
—Keokuk Gate City.

Not true—Kate's voice is mild and low,
Enchanting as a lyre:
And if of it the truth you'd know,
To church go and in choir.
—Cincinnati Saturday Night.

Pat says, "Be Jaber's I ye are right;
'Tis true whwat ye hev said;
Miss-Katees singing ivery night
I hears about me head."

ANOTHER CHAPTER OF THE BONNET STORY.

A wretch of a husband told his devoted wife that he didn't see any use of her paying thirty dollars for a bonnet when all she had to do was to take her little fancy-work basket, turn it upside down, run some gilt braid through the holes and perch a scarlet poppy and a yellow sunflower on one side. She had her revenge—he didn't dare to show his face at home for several days.—Andrew's Bazar.

GEOGRAPHICAL.

"Now," in a Chili tone she said,
"I will be Frank; 'tis true,
Although you Arab brilliant catch,
I do not Caffre you."

"O, lady, Dane to hear my suit—
This heart is Scot by thee."
"Nay sir. I cannot heed your words
For you Arnaut to me."

"'Tis Welsh," she added, freezingly,
"Since Siam pressed so far,
To Hindoo you no longer here:
And so, good sir, Tartar."

"What Ottoman like me to do?"
Bewailed the stricken man;
"I'll Finnish up my mad career,
And wed the Gallican."

THERE was an embarrassed young man at Bowling Green, Ky., who escorted the preacher's fair daughter to church on Sunday night and arrived late to hear the reverend gentleman read from the Bible as the couple marched up the aisle: "My daughter is greviously tormented with a devil," which verse occurs in an account of a New Testament miracle. The congregation smiled, and it would be hard to tell which felt worse, the preacher, his daughter, or her escort.—Atlantic Constitution.

DISAPPOINTMENT.

The time I've lost in wooing,
In watching and pursuing,
The light that lies
In woman's eyes
Has been my heart's undoing;
Though wisdom oft hath sought me,
I scorned the love she brought me,
My only books
Were woman's looks
And folly is all they've taught me.
—Moore,

The reason for my sighing,
My groaning and my crying?
My love has wilted
And I am jilted;
For a fellow with a mustache,
Who came from old Kentucky
With the name of being lucky;
He's took my girl,
Powder, paint and curl,
And I'll suicide if I'm plucky.

A CLERGYMAN'S wife had impressed upon her little boy the necessity of ejecting the skins of grapes, and a few days afterward she told him the story of Jonah and the whale. "The whale is a very large monster," said the mother, "and he swallowed Jonah." Did he swallow other men, too?" asked the little boy. "Well, I suppose he did," continued the mother, who was somewhat in doubt; and while she was hesitating about the continuation of the story, the boy interrupted, "And, mamma, did he spit the skins out too?"

For Women.

CONDUCTED BY MISS RAY CLARK.

THE BABY'S PICTURE.

"WE must carry our beautiful baby to town
Some day when the weather is fair," we said;
We must dress him up in his prettiest gown,
And wave his hair on the top of his head;
For all his cousins and all his aunts,
And both his grandmothers, proud and dear,
Declare it is shameful, and every way blameful,
To have had no picture of him this year."

He was three months old when we took him before,
And he lay like a lamb on his mamma's lap;
And the darling now has a twelve month more
Of bewildering graces from sock to cap.
Just look at his dear, little laughing face!
At the rose-bud mouth, at the violet eyes!
Why, the photograph-taker, that vanity-shaker,
Will think this time we have brought him a prize!

We carried our child to the town one day,
The skies were soft and the air was cool,
We robed him richly in fine array—
Ribbons and laces, and Swiss and tulle.
He looked like a prince in the artist's chair,
Sitting erect, and brave, and grand,
With his big red apple he scarce could grapple,
Held close in the palm of his dimpled hand.

"He is taking it now." We held our breath!
We furtively peeped from behind the screen!
"What a pose?" we whispered, then, still as death,
Waited—and baby was all serene
Till the critical moment, when, behold,
The sun was catching that lovely look,
Such a terrible roar, it shook the floor!
And that was the picture the swift sun took.

A wrinkled face and close shut eyes,
And a mouth that's opened so very wide,
That our dear little sister, sibyl-wise,
Declares she can see the cry inside.
Aunts and cousins and grandmothers dear,
Haven't got over their anger yet:
But we thought it was funny, and paid our money
For that strange phase of our precious pet.

Ah! children older than baby, think,
Dear little children blithe and sweet,
With your curls of gold, and your cheeks of pink,
And your naughty tempers, sudden and fleet—
What an awful thing it would be for you
If an artist should happen along some day,
And observing the pouting, the frown or the flouting
Should take a picture of you, that way!
[Christian Guardian.

REDEEMING THE TIME.

TEACH yourself, and your daughter after you, to perform all household duties with as great dispatch as consists with perfect thoroughness. Do not give needless time to any piece of work. Never wash and scrub and rub after all dirt is removed from clothes and wood-work, just "to be certain that they are clean." When you know that fact, be satisfied.

There are some women so extra thorough that it becomes (like any virtue taken to excess), a positive vice.

Mrs. R. used to scrub so unceasingly about her kitchen and sheds and steps that they were always in the uncomfortable process of drying, always damp and unwholesome, never white and sunny and neat.

Learn to stop when you are through.

Very elaborate work of any kind is not to great profit, especially in the matter of table fare. When one reads the difficult details of some wonderful article for dessert, which takes hours of skilled labor in the hot kitchen to make it; we wonder at the patience which holds out through it all, but sighs "to what purpose was this waste." Not waste of money, for that is trifling compared to the great waste of woman's life power which was given to her for so much nobler purposes.

My neighbor, Rev. Antoinette Brown Blackwell, well characterizes the sewing machine and cooking stove, as "the modern Moloch to which so many American women are yearly sacrificed."

A greater simplicity in the preparation of our food would save a full day out of every week to many a house-mother, and save many dear ones from the rack of dyspepsia in later years.

"Not one of mother's children," said a lady in middle life to me one day, "but has suffered agonies from dyspepsia; all the result of mother's splendid cooking."

With proper dispatch an ample, wholesome and delicious pudding can be made in five minutes and set in the oven to "cook itself," while an indigestible pie takes a great deal more time and wearying labor, and is not so satisfactory to a hungry person's appetite.

Young household members can be trained up just as you please in this respect, but it is hard to change the customs of those who are "joined to their idols." A hint may be found in this truth for young housekeepers just beginning to form habits for the house.

A wise simplicity in all your doings is for the advantage of all parties. It gives time for rest and for self improvement, and for the exercise of neighborly kindness and charity, and greatly conduces to the health of a family.

Plain fruits and vegetables prepared in a most excellent but simple manner, with suitable variety on succeeding days, are dishes "fit to set before the king." MRS. J. E. McC.

WOMAN'S WORK CONSIDERED.

I BELONG to the much-maligned army of spinsters, but am a reader of the RURAL, and would like a place among the RURAL Sisters.

These ladies need stimulating to a more vigorous use of their pens.

Few are so inexperienced as not to be able to add something to the general information as to the best, easiest, and most expeditious way of getting through housework.

When all is known, and housework made easy, it is no flowery road to travel, as some of us are ready to declare with emphasis.

But what most vexes my righteous soul is the want of appreciation among men of woman's work. The farmer, as a general thing, thinks that he works hard, but considers it a mere matter of moonshine to "run" a house of six or a dozen inmates. Oh! when I see what a plentiful lack of consideration and affectionate goodness many of these dear husbands extend to tired wives and mothers, I rejoice and am exceeding glad to have escaped the matrimonial harness.

Who seconds the motion that some married sister, who knows how, will give these husbands a "drawing over the coals?"

Having no settled abiding place, I have "stayed around," and had a few peeps "behind the scenes." Over-work is the bane of the average farmer's wife—want of recreation.

I have seen the inhumanity of some men to their wives—wives not over-strong too. I have seen a "house-band" with the digestion of an ostrich and strong as a horse snore abed mornings, while the mother who had not even rested the ache out of her body struggles unaided with the breakfast and the last baby.

On Sunday he passes along piously to church and listens from a front pew.

The wife is chief cook, chief nurse, chief everything. If there is a trifling culinary blunder, his reproaches seem to come easily. If the biscuit has not enough soda he is in a towering rage, and looks black if the meal is late or early.

Physicians tell us that women grow weaker physically, but most of my acquaintances are creatures of remarkable endurance. Many a *man*, in their shoes, would succumb body and brain.

Men have machinery to lighten their labor, but nothing has been invented yet to shorten the process of baking bread and pies in the country, or of resting arms aching and tired from an ailing, teething baby.

What wonder that a woman who has only been housekeeper and mother a few years looks like the parent of the fresh and rosy girl she was on the wedding-day!

All men cannot be managed in the same way. In some extreme cases it is proper to wipe weeping eyes, show fight and assert woman's rights, one of which is the privilege of resting when tired nature needs it.

Some women are working themselves under the coffin-lid and do not know it. The husband ought to see that there is sufficient help in the kitchen, or put his own hand to the rolling pin, and let her see that she has something strong and true to lean upon.

If ever I marry won't I manage my husband? He'll not be spoiled by being waited upon either. He shall hang his own hat and pull his own boots, and black them, too. I shall take time to read, rest, visit, and also to bestow some labor upon my outward adorning, and he shall "hold the baby while I'm getting tea." MISS IRENE.

Fairfax Co., Va.

OPPOSITION.

PERMIT me to say a few words in reply to Miss M. D.'s "Worldly matters for girls"; *I* most certainly do oppose somethings in her article of July 3rd and not from "the deep-seated prejudices of our grandmothers, but from my own experience and observation.

Yes, it is true that most young ladies use face-powder now, and to the great injury of the complexion they are trying to improve.

The first essential of a good, healthy, blooming complexion, is to have all the pores of the skin open, and this cannot be had if those minute openings are stopped up with glycerine and powder, or powder alone.

My experience and observation has taught me that powders or washes will invariably brown the skin. Some powders will do so in a short time, while others I have known to be used a year or more and then the skin suddenly become brown or dingy. There is no remedy for it then.

My advice to a young lady who has a good complexion, is never to put anything on her face that will stop up the pores of the skin.

To one who has a poor complexion, I would say—don't make it worse by stopping up the pores.

It is just as necessary to have the pores of the skin open as it is to have the lungs free from tubercles and in a normal condition.

A good hygienic diet is the best and surest remedy for pimples and blackheads, but it is not every one who can obtain that, although the less butter, sugar, cake, etc., that is eaten, the better it is for a person. The next best thing is to wash the face once a day with quite warm water and soap. Let the soap be of a good quality, and rub it well into the skin with a cloth or sponge, and then rinse it off thoroughly.

Bathe the face on getting up in the morning and before retiring at night, with either cool or warm water, though warm water is best at all times for a pimpled face, yet its use once a day is sufficient.

Of all the recipes I have tried this one is the best. The soap, I think, cleanses the pores of impurities, and the water seems to have a soothing, healing effect.

Decidedly cold water (my experience and observation teach me) is *very* injurious to a pimpled face. MRS. W. V. A.

N. Y.

ABOUT WOMEN.

JENNY LIND was recently congratulated by a lady upon the remarkable effect produced upon the public by the charms of her youthful voice. The great singer assumed a look of earnest excitation as she uttered from a full heart: "It was because my voice came from God, and I sang to God."

MISS BECKWITH recently performed the extraordinary feat of swimming for thirty consecutive hours in the whale tank of the Royal Aquarium, at Westminster, London. She was clad in a costume of black silk, trimmed with crimson, and displayed great agility in swimming and waltzing in the water.

THE rigid housekeeper, who rigorously compels everybody into obedience to fixed rules and laws, assures thereby her own ease, while a more genially benevolent woman shrinks with native generosity from constraining others to submit to that orderly arrangement which will directly result to her individual convenience.

As the daughter of a banker of Buffalo was walking along the street of that city, a handsomely dressed gentleman grasped the velvet purse that she held in her hand. The lady maintained her hold, the clasp flew open, the coin and notes fell scattered upon the sidewalk, and the "gentleman" departed rapidly, This is the second time that the lady has had an encounter of the kind. One might be allowed to wonder why she continues to carry so conspicuous a purse in so conspicuous a manner.

QUEEN VICTORIA rises at seven both in winter and in summer. The occupations of each hour of the day are arranged with a due appreciation of the value of time; hence she is able to undertake the heavy task of reading over all papers and documents submitted for her signature, which she never appends without careful perusal of each, beside which she personally enters into a wide correspondence, and, in addition to the hours devoted to official duties and to the hours given to walking, driving, paying and receiving visits, a portion of each day is set apart for reading of a varied character.

PROBABLY the prettiest pair of hands that ever were seen were granted by fate to a Philadelphia Quakeress. This quiet little Friend "spoke in meeting," and cynical observers would wonderingly remark that she frequently drew off the coarse cotton gloves, which poverty compelled without considering that the rough texture was displeasing to the touch of the dainty fingers. An ill turn from fortune's wheel made her husband a hardworking farmer, and the pretty hands most willingly and deftly dug the garden and scoured the pots, still looking like those of Queen Joanna of Naples, "that were only intended to be kissed." Ever intent on good deeds the gentle Quakeress, in a benignant old age, ministered, with her delicate soft touches in works of noblest charity to the criminals condemned by law to linger out their years within prison walls.

A LEGAL decision was recently rendered in New York, on application of Mrs. Anais Haase, directing the authorities of the German Hospital to amend the certificate of the death of her husband Charles Haase, who had died a few weeks previous in that institution under the name of Hector Carlos. The deceased flourished in New York for about fifteen years as the Baron de Maincy, moving in society as a gentleman of rank and elegance, and a successful teacher of the French language. It is now shown that he was a Prussian by brith, and was a hairdresser in Paris, where he was married in 1856. In 1862 he deserted his wife and two children, and established himself as a teacher of languages in London, under the name of H. Charles. Becoming more ambitious he next assumed the finer cognomen of H. C. d'Armet de Fouger, and under this name married a lady, whose money he obtained, and then absconded to New York; rising upon the new horizon as the Baron de Maincy. Meanwhile, the wife whom he had deserted in Paris nearly ten years before had reached New York also, and was supporting herself as a seamstress. She recognized her husband, but made no claim upon him, and removed to Baltimore, where she has continued her labors to this time. A few months ago a legacy was left her in France, and she found herself compelled to refer to her husband in compliance with legal forms. His death under a false name presented an apparently insurmountable obstacle. But it has been removed by the late decision, which indorses this just sentiment: "It should not be tolerated that after death the wrong which the husband inflicted upon his wife during life should be continued."

HINTS.

GLASS should be washed in cold water, which gives it a brighter and cleaner look than when cleansed with warm water.

"NEVER put a particle of soap about your silverware," says the proprietor of an old silver establishment "if you would have it retain its original lustre. When it wants polish take a piece of soft leather and whiting and rub hard."

To clean brushes and sponges use spirits of ammonia and hot water. Wash them well and shake the water out, drying on a coarse towel with the bristles downward. Little or no soap is needed.

MAKE YOUR OWN BAROMETER. A sheet of paper dipped in chloride of cobalt, when the weather is to be dry and pleasant, will become blue. When wet weather approaches it will become pink. The barometer flowers of France are thus manufactured.

ALWAYS cut your flowers with a sharp knife or scissors, and early in the morning or evening. Keep them well sprinkled; if possible add fresh water, and put in a little salt. Set the bouquet at night on the floor of a cool room or cellar.

A TEASPOONFUL or more of powdered borax thrown into the bath tub while bathing will communicate a velvety softness to the water and at the same time invigorate and rest the bather. Persons troubled with nervousness or wakeful nights will find this kind of a bath a great benefit.

IT is a good plan to put new earthenware into cold water and let it heat gradually until it boils; then cool again. Brown earthenware in particular may be toughened in this way. A handful of rye or wheat bran thrown in while it is boiling will preserve the glazing so that it will not be destroyed by acid or salt.

FEATHER pillows can be cleaned and purified without removing the feathers, by taking the pillows, laying them in a bath tub, scrubbing them with a scrubbing-brush dipped in a solution of two tablespoonfuls of ammonia to half a pail of warm water and rinse them thoroughly. Lay them out on the grass to dry, turning them frequently; and at the last pin them to the line for a number of days, and when quite dry beat them with a rod. This is to disentangle and lighten the feathers.

SUGGESTIONS FOR VISITING.—The question as to the amount of clothing to be taken on the occasion of a visit is one to which due consideration should be given before an invitation is accepted, or many annoyances are likely to ensue. On the one hand, while it is best to take a full supply of everything likely to be needful, including an ample stock of linen, yet when one's destination is in the country—at a distance, perhaps, of some miles from the nearest railway station—then the transport of boxes and trunks assumes a serious aspect.

If the friends to whom the visit is to be made habitually receive fashionable people, then it is important to be provided, so that you may preserve the harmony of the entire party; but if the house is one where no particular style is kept up, then it is out of place for visitors to be accompanied by an extensive and expensive wardrobe.

With regard to linen, visitors' washing is almost invariably sent out. The visitor should make out a proper list, to save all trouble and mistakes, and should settle the bill herself when the articles are returned, and not suffer the hostess to defray these expenses, even though she offered to do so; because then the visitor has only herself to consider when the question arises as to what number of articles should be sent.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM "EVERY-DAY HOUSE."

ANNIE L. JACK.

ALREADY the busy housekeeper feels the responsibility of the next three-quarters of the year upon her shoulders, and must calculate what fruits to secure for the season of frost and snow. With us all kinds are scarce. Of tree fruits, cherry and plum, there are none, while all the small fruits have to be *gleaned* from the bushes. So we begin with strawberries and try to secure a supply before drought shall wither them. I always find the *first fruits* really the best. In making preserves of this fruit we are careful to pick dry, and, when stemmed, to place them on flat dishes overnight, with powdered sugar sprinkled thickly over them. There is a fine syrup in the morning, and the berries do not break up. Raspberries and any other soft fruits are improved by this method. I often think what a blessing it is that during the "heated term" fruit is so plentiful. Dwellers in cities complain that when it reaches them it is often stale and unwholesome, and it should be the business of every fruit grower to see that only fresh, ripe berries go to market. If housewives would also refuse to buy crude vegetables and fruit picked too often in a condition of unripeness that secures firmness for carrying to market those who bring in supplies would soon find it to their advantage to improve the quality of their produce. In preserving, especially, is this needful, for how often has a half-decayed peach spoiled the jar; one or two over-ripe plums caused our choice cans to ferment. But *good, ripe, sound* fruit is at this season of the year a necessity to the system, cooling and correcting impurities of the blood, yielding the phosphates, carbonates and sulphates that are important ingredients in the masonry of the human body.

CANNING FRUIT.

ELINOR BROOKS.

Now that the fruit-canning season has come again, the 'Domestic" columns of the newspapers will be full of directions for the process. And yet, after all that has been, or can be written about it, there are two old adages on which beginners may most safely rely, and they are: "Practice makes perfect," and "Experience is the best teacher." During the first two or three years that I attempted canning our own fruit, I probably lost from 25 to 50 per cent. of all that I put up, and although I took a thousand times the care to have every step of the process exactly right that I now do, the result is now so different that I seldom lose a single can.

Many a time in my despair over the bubbling, bursting cans, I resolved never to attempt it again, and yet when the next basket of beautiful, fresh fruit was brought in, the sight would be so inspiring that I would gather up courage and try again, only to be again disheartened by failure. But, as in nearly every undertaking, perseverance at last conquered; and I can now fill the cans and set them away without the slightest fear of being startled by a pistol-like explosions at some future time. Probably some of the RURAL readers are now having a similar experience and are searching the papers for "help in their time of need;" so great is my sympathy for them in their discouraging and wearisome work that I would gladly lend them all the aid I can.

In the first place be sure that the fruit is fresh-picked and not over-ripe. Strawberries are perhaps the hardest to keep, and if they have been more than 24 hours off of the vines they seldom keep well or are of good flavor. If they have soured in the slightest degree before canning, they will have a disagreeable, acrid flavor, even if they keep without fermenting.

Next, be sure that the fruit is *thoroughly cooked*, so that all the air-cells are broken and the air expelled. Twenty minutes' cooking is not too long for berries and cherries, and the most of pears and peaches will bear from one-half to three-fourths of an hour without coming to pieces. Better let them break to pieces slightly than to run the risk of fermenting, as they will surely do if not well cooked.

Have liquid enough on the fruit. Some fruits, like strawberries, need no water added to them; others need considerable. At one time I had much trouble keeping Black-caps and I am confident now that they were too thick as they were poured into the cans. They should have liquid enough to float in and fill all the little spaces between the fruit. There is no necessity for heating the cans. If they are set on a thickly-folded, wet cloth there is not "the slightest danger of breaking." New cans are more apt to break than those that have been used. Lastly, put the cover on as soon as the can is level-full. Do not heap the fruit up so that when the lid is pressed on the seeds any juice will be trickling over the outside—perhaps gumming the ring so that it will not turn easily. Screw only moderately tight at first, but firmly as soon as cool enough to handle.

It would hardly seem necessary to say that the cans should not be opened until wanted for use, yet a friend told me that one Winter, being surprised at the amount of fermented fruit that was brought on her dining-table, she examined the fruit closet and found that nearly every can had been opened. Upon being questioned her "*curious* hired girl," confessed to having opened them. She "had wanted to see what was in them and didn't know it could do any hurt."

Dried Berries.

For some years I have thought I must can my Black-caps for winter pies, but last year, I had more than I cared to can, and I spread them on earthen plates, set them in the oven until they turned red, then put them out in the sunshine, and in 24 hours they were nearly ready to put away in paper bags. In the Winter, just before wanted for pies, I poured boiling water on them, covered closely and in a few minutes they were swollen ready for use. When baked in pies none of the family could tell the difference between the dried and the canned ones, and it certainly was easier work to dry them.

Will some of the RURAL friends be kind enough to give their experience with Patent Fruit driers? Not large ones but small and cheap, simply for family use.

DOMESTIC RECIPES.

Date Cake.

Two eggs, one-half cup of sugar, one cup of molasses, one cup of sour cream, one teaspoonful of soda, one teaspoonful each of cinnamon, nutmeg and cloves. Stir rather stiff with flour Then add a pinch of salt and one large cup of dates cut fine. Bake in a slow oven.

Tumbler Cake.

One tumbler of white sugar, one tumbler of flour, two tablespoonsful of butter, three teaspoonsful of baking powder, whites of ten eggs, flavor with lemon extract.

Pie Plant Pie.

Line a plate with rich pastry, then add one cupful of pie plant chopped fine, one cup of sugar, one egg well beaten and a small piece of butter. Cover with pastry and bake slowly.

Cream Cake.

Whites of four eggs, one cup of white sugar two teacups of flour, one cup of sour cream, three teaspoonsful of baking powder and a pinch of salt. Flavor with vanilla.

Ripe Tomato Pickle.

One peck of tomatoes, three pounds of sugar, one ounce of cloves, one quart of vinegar, one ounce of cinnamon, one-half ounce of ginger root. Slice the tomatoes, scald the vinegar sugar and spices together, pour over the tomatoes hot. Leave twenty-four hours, then put all over the fire and cook ten minutes, then take out tomatoes, cook down the juice and pour over. MRS. M. ALDRICH.

Genuine Scotch Oatmeal Cakes.

Ingredients: oatmeal, water and salt. Mix very stiff into oblong cakes one-eight inch in thickness and bake on boards before an open fire. By the addition of one or two eggs and substituting milk for the water these oat cakes can be made more appetizing, but this is, of course, a departure from the original recipe.

Wind Mills.

Halladay Standard.

VICTORIOUS AT
Phila., 1876—Paris, 1878
25 Years in Use.
GUARANTEED SUPERIOR
To any other Windmill Made.
17 SIZES—1 MAN TO 45 HORSE POWER
Adopted by the leading R. R. Co.'s and by the U. S. Govt. at Forts and Garrisons.
$3,500,000 worth now in Use.
Send for Catalogue "B" and Price List.
U. S. WIND ENG. & P MP CO.,
Batavia, Ill.

Adams Wind Mill.
Works in a lighter breeze than any other. Governs itself perfectly. Its operation can not be interfered with by ice or sleet storms. Well made, Strong, Durable. Illustrated circulars of all our goods sent free. Address MARSEILLES MFG. CO., Marseilles, La Salle Co., Ill. Send for Catalogue "C."

CHALLENGE WIND MILLS
Victorious at all fairs. Over 7,000 in actual use in every State and Territory of the U. S. It is a section wheel—has been made by the present Co. for ten years; in all that time not one has blown down without tower breaking—a record no other mill can show. We leave it to the public to determine their merit. Mills sent on 30 days' trial. Best Feed Mills, Corn Shellers, &c., &c. Catalogue free.
CHALLENGE MILL CO., Batavia, Ill.

THE
WATERTOWN
Wind Mill.
Send for Descriptive Circulars to
H. H. Babcock & Sons,
WATERTOWN, N. Y.

I. X. L. WIND MILL.

For Simplicity, Durability and Power *this mill has no equal.* It runs equally well in light or heavy winds. Ice and sleet do not effect it. Works well under all circumstances; never gets out of order. We warrant all our mills. Circulars and descriptive catalogues sent free on application to the Phelps & Bigelow Wind Mill Co., Kalamazoo, Mich.

MAST, FOOS & CO.
SPRINGFIELD, O.
MANUFACTURERS OF THE

Thousands in Use!
Runs in a Light Wind.
IRON TURBINE
WIND
ENGINES
Strong and Durable
WILL NOT
SHRINK, SWELL, WARP, or RATTLE in the Wind
ALSO, THE
BUCKEYE FORCE PUMP
Never Freezes in Winter Time.
Send for our Circulars and Price List.

IMPROVED CALIFORNIA
WIND MILL.

Simple, Strong, Durable, Rosette Wheel and perfectly Self-regulating, avoiding 100 wearing joints. Also, Steven's Pony Feed Grinder and a perfect Rotary Motion attachment, without gearing, the power being communicated by the lift or up stroke of Pump Rod. Can be used for cutting feed, churning, &c. The best, cheapest and most useful power in the market. Full particulars, circulars, &c., sent free. Address the Manufacturers. CLARK & CO., SOMANAUK, ILL.

Implements and Machinery.

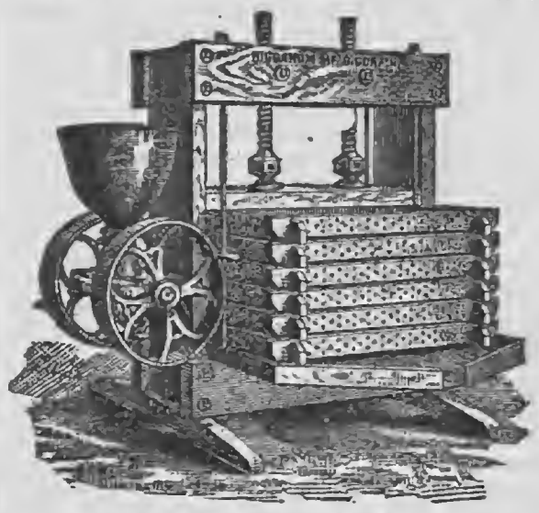
LA DOW'S JOINTED
Pulverizing and Smoothing
HARROW.

Light, Simple, Cheap.

Durable and Flexible

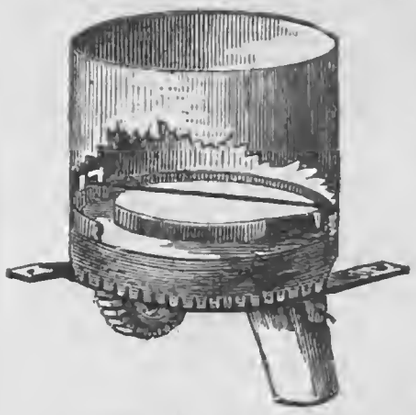
Being jointed in the center, is adapted to both smooth and uneven surfaces. Acknowledged the best of the kind, and will pulverize and cover seed better in one operation, than going over twice with others. Made with both Chilled Metal and Cast Steel Discs polished. Send for circular and price list. Manufactured by
WHEELER & MELICK CO.,
Albany, N. Y., for the United States.
By EVERETT & SMALL, Boston, Mass., for the N. E. States, and by BUDLONG & CO., Aurora, Ill., for Ill., Iowa, Wis., Minn., Neb., Kans. and Mo.
"Also, La Dow's Disc Corn Cultivator."

Here You Have It!
SWEET CIDER! SWEET CIDER!



A mill that will grind fifty to sixty bushels of Apples per hour, combined with a press that will press Seventy-five gallons at a pressing. Do not fail to send for our New Illustrated Catalogue of Cider Machinery, manufactured by the
HIGGANUM M'F'G CORPORATION,
Higganum, Ct. U. S. A.
Manufacturers of Agricultural Implements of every description.

EMPIRE DRILL.

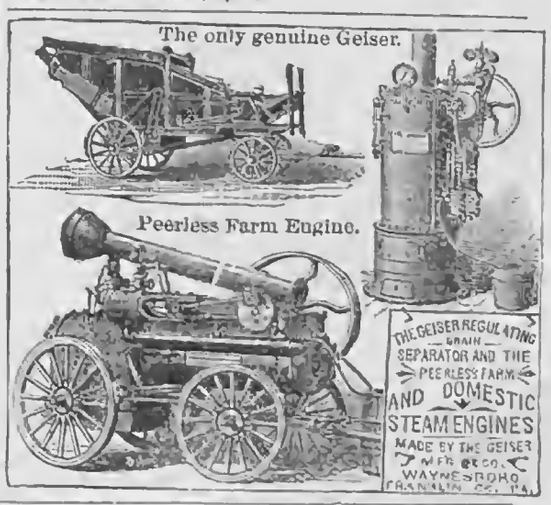


Sows all kinds of Grain evenly and accurately without bunching or breaking the kernels. Sows any brand of Commercial Manure without pasting or clogging.

THIS CUT REPRESENTS OUR NEW FORCE-FEED FERTILIZER DISTRIBUTOR.

THE ONLY DRILL IN THE WORLD
Having a Force Feed-Grain and Fertilizer Distributor.
Quantity of Grain and Fertilizer sown regulated by change of gear.
Send for circulars describing this wonderful invention, to the
EMPIRE DRILL CO., Shortsville, N. Y
Mention this paper.

The only genuine Geiser.



Peerless Farm Engine.

THE GEISER REGULATING GRAIN SEPARATOR AND THE PEERLESS FARM AND DOMESTIC STEAM ENGINES

News of the Week.

MISCELLANEOUS NEWS.

Monday, July 19th, 1880.

Gen. Hartranft, until recently postmaster at Philadelphia, has been appointed Collector of Customs of that port and formally took possession of the Custom-house on the 15th.....The anniversary of the destruction of the Bastile, in the French Revolution, on July 14, 1789, is a national holiday for the French, and the day was celebrated in many places by the French in this country..... Chastine Cox, the negro who murdered Mrs. Dr. Hull in her bed in June last year, was executed in the Tombs' court-yard this city on the 16th..... Statistics relating to emigration from Germany have been recently submitted to the German Parliament. The number of emigrants during the past eight years are given as follows: 1872, 125,650; 1873, 103,638; 1874, 45,113; 1875, 30,773; 1876, 25,368; 1877, 21,964; 1878, 24,217; 1879, 34,327. Important as was the increase marked by last year, as compared with the years immediately preceding, the numbers given for the two years following the Franco-German war has never since been anything like reached. The 33,327 registered for 1870 consisted of 20,106 males and 13,221 females. No less than 21,150 were from Prussia. North America was the goal of 30,808, Brazil of 1,830, and Australia of 274..... ....A freight train was wrecked at Lansingburgh, N. Y., on the 15th. A lot of dynamite in one of the wrecked cars happily did not explode. A number of cars were literally reduced to splinters. The few train hands on board escaped unhurt.....To be a land agent in Ireland is not a very enviable position. According to recent accounts, the peasants are shooting them quite freely whenever they get a chance..... Lynch law seems to be reigning in New Mexico. On three successive nights, July 3, 4 and 5, a mob surrounded the jail at Lincoln, and on the first night killed a prisoner; on the second night they killed the deputy sheriff, who was in disfavor with the outlaws, and on the third night they took out and lynched another prisoner. A division of the regular army might there find something to do besides fighting Indians.....The Chief of the Bureau of Statistics furnishes the following information in regard to immigration into the ports of Baltimore, Boston, Detroit, Port Huron, Key West, New Orleans, New York, Passamaquoddy, Philadelphia and San Francisco: There arrived at the above, named ports during the month of June, 1880, a total of 76,356 passengers, 72,567 of whom were immigrants

England and France advise Greece not to fight the Turks till the latter have a chance to think better of it. It is believed that Turkey will finally accede the territory demanded by the terms at Berlin.....San Francisco's population is 233,066, including 20,549 Chinese .....Railroad building is going on rapidly in Mexico. Over 800 miles of road are completed and in operation, and three important roads are now under construction—one over the Isthmus of Tehuantepec, another from Guaymas to El Paso, and the central from the capital to the city of Leon, a distance of 362 miles... ....The issues of postage stamps, stamped envelopes and postal-cards during the fiscal year ended July 1, foot up $31,952,519, an increase of nearly $3,500,000 over the total of the preceding fiscal year, or 12 2-10 per cent. This percentage is about double the average rate of increase during the previous five years.....Applications for pension arrears reach Washington at the rate of 400 a day, though the time for their reception expired June 30, as the claimants believe that Congress will extend the time for presenting such claims. Over 48,000 applications were filed in June.....

At noon to-day, Dr. Henry S. Tanner, the faster from Minneapolis, whom we mentioned last week, completes the first three weeks of his abstinence from food, and enters upon the fourth in the best of spirits. The doctor is, to all external appearances, in better physical condition than he was at the expiration of the fifteenth day, until which he had been losing in weight pretty steadily, at the average rate of 30 ounces a day. He now drinks water to a moderate extent, and under this diet he even gained one pound in 24 hours, but he lost this increased weight the following day. The blood has been examined and pronounced normal, but upon what grounds is not apparent, for the number of colored corpuscles to the cubic centimetre was not counted, and whether it was 4,000,000 or 400,000 is a point upon which no registry exists. Nor was the ratio of white corpuscles to colored made a subject of inquiry, so far as appears. A representative of the RURAL visited the doctor yesterday. He appears in perfect health, and is still confident that he can perform the feat of fasting 40 days. In conversation with a doctor of the "regular" school, the latter admitted to the RURAL representative that he was totally at a loss how to account for the endurance of the faster. He was confident, however, that no food had passed his lips the last three weeks. Even those who expressed the belief a few days ago, that Dr. Tanner was trying to deceive the public have now abandoned that view and are taking a real interest in the case. His watchers are, if possible, still more vigilant than they were at the beginning, and there is no opportunity to deceive, even if the fasting man were inclined to do so....

An illustration of the peculiar vicissitudes of life has recently come to light. A man named Madison Robinson married a girl named Hattie White in 1854, in Ohio. They lived well together for five years and three sons were born to them. In 1859 Robinson took the gold fever and started for California. For four years his wife received letters from him regularly, they then grew less frequent and finally ceased. Time rolled on and as no tidings came from the absent one he was given up for dead. His wife was wooed by a former lover of her youth and she wedded him 14 years after her first husband had left. They removed to Iowa and settled near Decorah. The long-lost Robinson arrived the other day, after an absence of 21 years, and heard for the first time of his wife's second marriage. He had roamed over a large part of the world, and visited British Columbia, New Zealand and Australia, he returned again to this country became a speculator in Leadville mines, and now has amassed a fortune of $250,000. His wife's second husband has died and he has gone to reclaim her.....

A young man, who said his name was John H. Christiancy, was committed to the Kings County Inebriates' Home, N. Y., on Saturday last, by Justice Bloom, of Brooklyn, under peculiar circumstances. He went to the Justice in the morning, giving his name as above, and said he was a lawyer, and a son of ex-Senator Christiancy, of Michigan, now United States Minister to Peru, showing letters to confirm his statement. Young Christiancy declared that the liking for strong drink had obtained such a mastery over him that he was compelled to ask the Justice to send him to the Inebriates' Home until his taste could be cured. He had not been long in Brooklyn, and was boarding at a lodging-house on Main Street, and was without friends or money. He thought his father would pay his board in the Home if he was told his condition. It was then arranged that one of the court officers should swear out a warrant charging Christiancy, "on information and belief," with being a habitual drunkard, and Justice Bloom then committed him to the Home for six months.

AGRICULTURAL NEWS.

The Supreme Court of Wisconsin has decided that dealing in grain "on margin" is gambling, and that contracts of this kind will not be enforced by the courts....An Indiana farmer says that labor has not been so scarce and high-priced in 65 years, and instances the employment of two women in his harvest fields at $2 a day as proof. ....The State of Mississippi is to have an agricultural college. The institution is located at Columbus, and will be opened during the Fall for the admission of classes. General S. D. Lee has been appointed President, and two of the graduates of the Michigan Agricultural College are engaged as members of the faculty of the new college. Mississippi has, it is said, taken the Michigan college as its model in its course of instruction and in the matter of compulsory labor....The Mark Lane Express, a well-known London commercial newspaper, has passed into the hands of new owners, including several members of Parliament and gentlemen representing important agricultural interests....The famine in Kurdistan is still so terrible that at El-Kosh the Kurds have sold hundreds of young girls at about $10 a head in order to buy food. The British Consuls, the Armenian relief committees, and the American missionaries have been most active, and have done all in their power to alleviate the miseries of the famished population; but the means at their disposal are very insufficient, and there has been hitherto great difficulty in transporting grain from one district to another, partly on account of the deep snow and condition of the roads, and partly on account of the general insecurity....The Mark Lane Express of June 12, in its review of the British grain trade during the past week, says: "Farmers express great anxiety about the weather. Unseasonable weather never fails, at this season, to exercise a hardening influence on the grain trade, and the copious showers of the past fortnight have increased the activity in wheat. Supplies of home-grown were small. Sales were more readily effected at the frequent advance of one shilling per quarter. Farmers now hold so little grain that holders feel justified in declining to sell, except at higher prices. Both English and French stocks of native wheat are practically exhausted. The consumption of both countries has to be met by foreign produce, for which a fair trade was experienced at advancing prices. At the moment the situation is decidedly critical. Stocks have been worked so low by the disinclination of buyers to operate for future delivery that it needs only a week's wet weather to bring about such a state of activity as will materially change present values. There is no abatement in the continental demand. The exports for the past month were nearly 36,000 quarters; during the same time the imports were only 30,000 quarters. Red wheat was held with extreme firmness. The market closed on Friday expectant, if not excited, with stocks at the lowest and prices at the highest. Maize, 3d. to 6d. dearer. Oats in fair request, but unaltered. The feature of the week has unquestionably been the large demand for foreign white wheat, such as Australian and New Zealand, for the North of England and the Continent. Trade closed very strong for these descriptions at an advance of a full shilling since last Monday. Sales of English wheat last week, 15,753 quarters, at 43s. 9d., against 27,727 quarters, at 43s. 4d. for the same period last year. The imports for the week ending July 3 were 939,984 hundred weight of wheat and 195,832 hundred weight of flour."....Judging from full reports to the Tobacco Leaf, the tobacco crop of '80 will be very short, owing chiefly to drought. Reports from Kentucky indicate half a crop; those from Virginia and Tenn. are a little more favorable; while those from Ohio and Ind. promise two-thirds of a crop. In New York, Penn. and Wis. the crop is likely to be fully an average one, and that in New England even better. The tobacco in the seed-leaf districts is in better condition than elsewhere, owing, most likely, to the better preparation of the ground and greater care in transplanting....California expects a surplus of 14,000,000 or 15,000,000 centals of wheat, and Oregon anticipates one of 5,500,000 to 6,000,000.....The Maryland and Delaware railroads, from full inquiry, expect to carry to market 4,000,000 bushels of peaches this season, against 3,480,000 bushels last year—yet the crop has been ruined!!.....Prof. Comstock, of the Agricultural Bureau, thinks that owing to the attention lately attracted to the Army worm, such effective means for its destruction will be devised against its next appearance that it will probably soon disappear from among the farmer's pests. Well, let's hope so.....At the close of the present fiscal year, it is more than likely that the U. S. Entomological Commission composed of Professors Riley, Thomas and Packard, will be discontinued and thenceforth all investigations into insect depredations will be conducted under the supervision of the Dept. of Agriculture. The present commission is about to expend its late appropriation of $20,000 in further investigation of the cotton worm, locust, Hessian fly, chinch bug, etc. .....The following cablegrams give the latest account of the European crop prospects:—Paris, July 15.—The Echo Agricole considers that the harvest prospects in the north, with tolerable weather, are eminently promising; good in the central districts; scarcely up to the mark in the west and east, and well up to the average in the southwest and the district around Paris. The quality in general is decidedly superior to that of the season 1878-9. There are also good prospects of the crops of potatoes, beets and hops. The hay crop is not successful, but there is every chance of a good aftermath. The fruit trees and vineyards do not share the improving aspect, excepting the olive, which promises a good yield. In Holland there is an excellent crop of rye. In Germany, rye, coza and potatoes require more sun. The hay crop is very bad, and the only thing that looks well is wheat. Austria suffers much from wet weather. In Hungary, barley, wheat and rye are very promising, and oats and maize are considerably above average. The Italian harvest is superior both as to quantity and quality. Russia is complaining loudly of a deficiency, partly owing to the presence of myriads of insects.....London, July 16.—A Berlin dispatch says that the government has published, during the last few days, many reports on the harvest expectations in the different provinces, and a resume of all these statements appears in the semi-official report of the Provincial Correspondence, which says it was generally feared that the harvest would be a miserable one, but, after the very favorable weather of June, it is hoped the harvest will exceed former expectations. Reports from different provinces of the monarchy given by the agricultural societies, state that the fear of distress appears to have had no foundation whatever. Grain has certainly suffered very much from frost, and the reports from many provinces are very unfavorable in this respect, but in some of the highly-cultivated districts a good grain harvest may be reckoned on..... A cablegram from St. Petersburgh, Russia, on the 18th of July says:—The *Golos* publishes an article based on the returns sent by the Governors of forty-eight provinces in European Russia showing that the total deficit of the grain as compared with the average crop will amount to 9,761,310 quarters, and says in view of the poor harvest it is considered impossible to export the usual average of 40,000,000 quarters without suffering an insufficiency for home consumption. Another announces that it is not unlikely that Russia will prohibit the export of grain in view of the probability of a short harvest.

Other cable dispatches say that heavy rains have caused great damage to hay and other crops in the Midlands, Warwickshire and Leicestershire, and in other parts of England; that excessive rains have prevailed nearly all over Ireland during the last fortnight, and are beginning to excite serious apprehensions in regard to the harvest, and that in many parts of France the harvest has already begun and gives opportunity of, in some degree, forecasting the prospects. In the south, barley and oats promise well. In the centre, Winter barley is of good quality, but deficient in quantity. Rye looks well, also wheat, which is an average good crop..... The following statement showing the condition of cotton, corn and wheat, was issued by the Department of Agriculture, on July 15. *Cotton.*—The returns to this department show an increase in the condition of cotton since the June report. The condition is reported at an average of 100, being the highest reported for July for several years. Forty-five counties in North Carolina average 101; 19 counties in South Carolina average 99; 70 counties in Georgia average 97; 16 counties in Florida average 92; 31 counties in Alabama average 93; 40 counties in Mississippi average 99; 16 counties in Louisiana average 96; 71 counties in Texas average 111; 33 counties in Arkansas average 104; 23 counties in Tennessee average 103. There are some complaints of drought in North and South Carolina, and of too much rain in Mississippi, Louisiana and Arkansas. Insect injuries are not reported to any extent. *Corn.*—The increase in area planted in corn is one per cent. over that planted last year. The average condition of the crop for the whole country is the highest for many years, and is 100, being seven per cent. more than last year at the same time. There are some complaints of drought in the South Atlantic States, while in the Valley of the Mississippi and those States north of the Ohio river there is complaint of too much rain. The Pacific States report a very high condition. *Wheat.*—The general average of Winter wheat July 1, 1880, was 95, against 91 July 1, 1879. It improved slightly during June. The whole South falls off nearly a fourth, but the the heavy Winter wheat region north of the Ohio river rules high, at 98. The Middle States are three per cent. above the average, and the Pacific four per cent. West of the Mississippi the crop averages 84, against 89 last year. Spring wheat averages 91, the same as in July, 1879. This shows a great decline in June, when the average was 97. The New England States average 99; the Middle States 93. North of the Ohio the average is 96. West of the Mississippi the general average is 90, Minnesota being 101, while Nebraska falls to 62° Iowa stands at 91. On the Pacific coast California reports 96. New Orleans, July 15.—The first bale of new cotton was received from Galveston to-day, classed strict middling, and was sold for 16 cents per pound.

The entire exports of agricultural products of Canada were in 1879 $25,970,887, only $2,890,858 of which represented wheat and its products. The value of butter reported, $2,101,897, almost equalled the the value of wheat; and the value of cheese exported $3,790,300, exceeded that of wheat.....In accordance with call of Gov. Cornell, the first meeting of the Board of Control of the New York Agricultural and Experimental Station was held in the Executive Chamber at Albany, on Tuesday morning, July 14th. The following-named members were present: Gen. N. M. Curtis, of Ogdensburg, President of the New York State Agricultural Society; W. A. Armstrong, of Elmira, Master of the New York State Grange: Dr. A. S. Heath, of New York City, President of the American Institute Farmers' Club; P. Barry, of Rochester, President of the Western New York Horticultural Society. After the meeting was called to order Gov. Cornell was selected temporary Chairman and Gen. Curtis, temporary Secretary. Mr. Daniel Bachelor, a representative of the Central New York Farmers' Club, was invited to a seat during the meeting. The Board of Control divided itself, by lot, into three classes, representing terms of one, two, and three years, as follows: For the first class, who shall hold office until the time fixed for the first annual meeting of the board—James McCann, of the Elmira Farmers' Club, and Samuel Campbell, of the Central New York Farmers' Club; one undrawn. Second Class—Dr. A. S. Heath, of the American Institute Farmers' Club; P. Barry, of the Western New York Horticultural Society, and ——, of the Western New York Farmers' Club. Third Class—Gen. N. M. Curtis, of the New York State Agricultural Society, and W. A. Armstrong, of the New York State Grange: one undrawn. The next meeting will be held at the rooms of the American Institute, No. 22 Cooper Union, New York, July 30th, at noon.

A Busy Life.

The World's Dispensary at Buffalo, N. Y., is a great institution, having its auxiliary Invalid's Hotel, for accommodation of patients, costing its founder nearly half a million of dollars, and its branch in London, England, of similar proportions, where Dr. Pierce's Golden Medical Discovery, Pleasant Purgative Pellets and other remedies are manufactured for the foreign trade, which extends to the East Indies, China and other far distant countries. All this mammoth business has been organized, systemized and built up by Dr. R. V. Pierce, who has associated with himself as a Faculty, under the name of the World's Dispensary Medical Association, a most competent staff of physicians and surgeons who annually treat many thousands of cases of chronic diseases, not by prescribing any set lot of remedies but by using all such specific remedies as have, in a large experience, been found most efficacious. Besides organizing and directing this mammoth business of world-wide proportions, Dr. Pierce has found time to write a work on domestic medicine—entitled "The People's Common Sense Medical Adviser"—1,000 pages, 300 illustrations, selling at $1.50, and and also to serve a term as State Senator and later as member of Congress. Surely he must be competent if he were to take the lecture platform, to discourse upon "the recollections of a busy life."—National Republican.

THE superiority of BURNETT'S FLAVORING EXTRACTS consists in their perfect purity and great strength.

A Railroad Engineer

in the employ of the C. M. & St. Paul R. R., has been grievously affected with diabetes for six years. He took four boxes of Kidney-Wort, and now writes that he is entirely cured. Get a box and try it.

WOMEN that have been given up by their dearest friends as beyond help, have been permanently cured by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. It is a positive cure for all female complaints. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for phamphlets.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 17, 1880.

BEANS AND PEAS.—With the belief that buyers will soon have to replenish stocks for export and home use, the market has ruled very firm for best grades of white beans. Poor qualities are dull; few buyers will take the chances of heat-affected parcels, which are likely to further deteriorate. General receipts are moderate, which tends to give holders confidence.

Marrow beans, prime, $1 62½; other, $1.50@1.57½; medium, prime $1.37½@1.40, other, $1.25@1.35; pea, $1.45@1 65. white kidney, $1 70@1.85; red kidney $1.20 @1.40; black (or turtle soup), $2 20@2 25 Lima, Cal., $5.

Receipts of beans for week, 1,815 bush.; exports, 2,551 pkgs.

BEESWAX.—Demand is small and prices are unchanged; sales at 23½@24c. for Western and Southern.

BROOM CORN.—Demand is light and prices unchanged.

Brush and short broom, choice, per lb., 7@8c.; common to good, 5@6½c.; hurl, good to choice, 7@8c; do., common to fair, 5½@6½c.; red and crooked at 3@4c.

BUTTER.—The weather has been so uninterruptedly hot that samples have almost run off the dryer, and few large transactions are to be noted. Faultless State creamery is still scarce and selections are marked higher. Strictly fine half tubs are scarce and are higher in sympathy with creamery, and the additional demand now directed to them. Shippers are not using stock freely nor are they likely to call for the cheaper styles of Western while there is a cold storing of perhaps 80,000 pkgs. which tends to keep the market poised to their views of prices. The independence however, is not all on one side as much of this surplus is of a grade that will sell on its merits with favorable surroundings. And then besides those figures represent a good many small Summer packages. Useful table grades of western are active in the scant supply of state, and prices are steady for upper grades. Prospects are for an immense general crop.

Creamery, finest 23@24c.; good to prime, 22@23c.; fair to good, 21@22c.; sweet cream, 21@23c.. State firkin and yellow 20@23c.; pails and hf. tubs, choice, 21½@22c.; o h-r 19@20c.; Welsh tubs, best 21c; other 18@19c.; Western imitation creamery, 14@18½c.; dairy, fresh, extra 17@18c.; poor to prime, 10@17c.; factory, fine 16c.; other 13@15c.

Receipts for week 38,850 pkgs. Exports 6,153 do.

CHEESE.—The market has had a sharp upward turn this week as the arrivals have been moderate, and the inquiry from exporters steady and good. Shipments are 76,700 boxes and the market closed with the supplies well sold up.

Latest sales are for State factory, fancy, 9½@9¾c.; do. good to prime, 8¾@9c.; do. fair to good, 8@8¾c.; do. half skimmed, 6½@7c.; Wisconsin factory, fine, at 9¼@9¾c., do. good to prime, 8¾@8¾c.; do. fair to good, 7¾@8¼c.; Ohio factory, fine, 8¼@9c.; do. good to prime, 8@8¼c.; do. flat, fair to good, 7¼@8c.; do, poor to fair 6¾@7¼c.

Receipts for week, 82,820 boxes.
Exports, 70,550 do.
Liverpool cable, 50s.
Steam, 35@40s.

COTTON.—The market is without much life, and prices closed steady at for July, 11.63@11.65c.; August, 11.57@11.58c.; September, 11.09@11.10c.; October, 10.67c.; November, 10.53@10.55c.; December, 10.54@10.55c.; January, 10.60@10.62.; February, 10.71@10.74.

Quotations for spot cotton are based on American standard of classification, and on cotton in more running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*N. Orleans and Gulf.*	*Texas.*
Ordinary	8¼	8¼	8¼
Strict ordinary	9	9¼	9¼
Good ordinary	10	10⅛	10⅛
Strict good do	10¼	10⅝	10⅝
Low middling	11¼	11⅜	11⅜
Strict low middling	11⅜	11¾	11¾
Middling	11⅞	12	12
Good middling	12⅜	12½	12½
Strict good middling	12⅝	12⅞	12⅞
Middling Fair	13⅛	13¼	13⅜
Fair	13¾	13⅞	13⅞

STAINED.

Good ordinary	8¾	Low middling	9¾
Strict good ordinary	9	Middling	10 11-16

DRIED FRUITS.—The market continues very slow and prices nominally unchanged. Quotations are For North Carolina apples, fair to good, at 6½@7¼c.; choice, at 8@8¾c.; New York State quarters at 7¼@7¾c.; patent evaporated, in cases, choice at 14@14½c.; good and prime 13½@14c.; evaporated, sliced at ——c. Evaporated peeled peaches, good to choice, at 26@28c.; North Carolina peeled choice 16@17c.; Georgia prime at 15@16c.; fair to good at 13@14c.; common at 10@12c.; unpeeled halves at ——c.; do. quarters at 6@6½c. Pitted cherries old at 15@16c. Blackberries nominal. Raspberries at 28c. Plums at 17@18c.

EGGS.—Receipts for week, 8,673 bbls.; do last week, 5,927 do. The market has ruled strong but it is a sensitive one in summer and larger receipts have decreased the firm selling portion of the early part of the week. The dependence is mainly upon prime Western stock. Few near points reach here during the season of vacations.

Near Points 17@17½c. State and Penn. 16@16½c. Western and Canadian fresh 15½c.; stored or second grade 14@15c.

FLOUR.—The crop reports have stimulated trade and tended to higher prices.

Latest prices are $3.40@4.25. for inferior to fancy superfine State and Western; $4.25@4.50 for ordinary to very good extra State, and lots and lines; $4.50 for very good to fancy do.; $4.25@4.40 for ordinary to very good shipping extra Western, and $4.50@4.75 for good to fancy shipping extra do.; inferior to very good white wheat extras, $5.25@5.75; very good to very choice do. at $5.75@6.75; red and amber winter wheat, inferior to choice trade and family, at $5.00@6.25; round hoop Ohio, $4.45@4.50; and trade and family brands of do, at $5.00@6.85; St. Louis at $5.10@5.85 for inferior to good extra; $5.85@6.75 for good to very choice; Minnesota clear, very inferior to fancy, at $4.25@6.35; Minnesota "straight," very poor to very fancy, at $5.85@7.25, and patent inferior to fancy at $6.00@8.50; unsound stock at from $2.25@5.00; city mill extra at $5.30@5.65 for good to choice West Indies; do. for England, $4.25@4.65 for poor to very choice spring wheat, and $5.10@5.60 for winter wheat product; do. trade and family extras, $6.10@7.00 do. for South America, $5.65@6.00; No. 2 at $2.40@3.50 for poor to very fancy, the latter an extreme.

Receipts for week, flour, bbls. 102,816; corn meal, do. 4,190, wheat, bush. 1,360,900, corn, do. 2,083,250, oats, do. ——; rye, do. 9,064; malt, do. 187,600; rice, pkgs. 320.

Exports, flour 76,501 bbls.; corn meal, 5,900 bbls.; wheat 1,752,877 bush.; corn, 1,392,900 bush.; oats, 4,181 bush.; rye —— bush.; malt —— bush.; peas 1,800 bush.; rice 611 pkgs.

CORN MEAL.—Sales at $3.15 for Brandywine, and $2.80@$3.75 for yellow Western.

FRESH FRUITS.—A heavy apple crop is already showing almost unmarketable installments. Selections only bring the extreme. Sales largely at 50 bbls. buck to venders. Peaches held pretty good prices and quality from upper sections is improving. Pears will be only a moderate crop this season; present supply Southern. Currants unusually low; small have been down to 1c; much of the supply softens with the weather. Raspberries running out and generally poor.

Apples, N. J. Astrachan, 75c@$1.50; Sweet Bough, 50c.@$1; Sour, 50c@$1. Md. Astrachan, ₱ cr., 5@7c.; Md. green, 25@30c. Peaches, Md. & Del., Troth, ₱ cr., $2.50@3; Hale's Early, ₱ cr. $1@2; Hale's, ₱ basket, 75c.@$1.25; N. C. prime, ₱ bu. cr. $2.50@3; poor to good, ₱ cr. $1@2; Ga. fancy, ₱ ½ bu. cr., $1.75; common, ₱ ½ bu. cr. $1@1.25. Pears, Clapp's Favorite, Southern, ₱ cr., $3.50@5; do; Manning's Elizabeth, Southern $2@2.50; Jargonelle, Southern, $2@2.50; Bell, Southern, p r bu., $@6; Harvest pears, Jersey, $3@4; cooking pears, $2@3. Plums, Wild goose, Md. & Del., ₱ qt. 1½@1½c., Beach, 5@7c.; Damson, 10c. Blackberries, Lawton, Jersey, choice, ₱ qt., 8@10c., poor to good, ₱ qt., 5@7c.; Wilson, Md. & Del. ₱ qt., 4@7c. Raspberries, Red Antwerp, up-river, 3-to-qt. cup, 5@8c.; native, up-river, ₱ 3 to qt. cup, 2@3c.; Jersey, ₱ 3 to qt. cup, 2@3c.; Brandywine, up-river, thirds, 5@6c.; Md. & Del. ₱ pint 6@7c. Whortleberries, Shawangunk Mountain, ½ bu. box, 75c.@$. ; Jersey, ½ bu. box, 62@87½.; Md. & Del. ₱ qt., 5@7c. Currants, cherry, ₱ qt., 4@7c.; small, red, 2@3½c.; black, 5@6c. Apricots, up-river, prime, ₱ qt., 3@4c.; common, ₱ qt., 1@2½c. Watermelons, Norfolk, ₱ 100, $10@18; N. C., $6@20; Ga., unselected, $20@30. Nutmeg melons, Jenny Lind, Jersey, ₱ bbl., $3.50@4; Norfolk, $1.50@2.50; citron, Norfolk, $1.50@2. Hot-house grapes, Black Hamburgh, ₱ lb., 60@75c.; grapes, Sweet Water, ₱ lb., 20@35c. Peanuts very dull; Va. hand-picked, ₱ bu., 5¾@5¾c.; extra prime, 4¾5c.; good to prime, 4¾c.; shelled, 5¾@5¾c.

GRAIN.—Wheat has been very active on account of the unfavorable crop reports from domestic and foreign sources, and prices are higher and strong.

Latest sales are of No. 1 white at $1.18; do., July, at $1.15½@1.15¾; do., August, at $1.08¾@1.09; do., September, at $1.08¾; ungraded white at $1.15@1.16; No. 2 red at $1.10@1.12; do. July, at $1.15¾@1.16¾; do. August, at $1.09¾@1.10¾; do., September, at $1.09@1.09¾; No. 3 red at $1.15@1.15¾; ungraded red at $1.05@1.20. No. 2 amber in lots at $1.18@1.70; ungraded amber Southern at $1.15; No. 2 Milwaukee and hard spring at $1.12@1.12½; No. 2 Chicago spring at $1.11. Rye at 78@80c. for prime Western for August delivery. Corn has been fluctuating but closed active at an advance; latest sales are of New York No. 2, at 48½@49c.; do., July, at 49@49¼c.; do., August, at 49@49½c.; do., September, 49½@49¾c.; New York steamer mixed at 47@48c.; ungraded mixed Western at 45@50c.; No. 2 white at 52@53c.; New York yellow at 51c. Oats are freely offered and favor buyers; latest sales are of No. 1 white at 40c. bid and 41c. asked; No. 2 white at 34½@35c.; No. 3 white at 33@33½c.; New York No. 1 at 35c.; New York No. 2 at 34½@35c.; do., July, at 35c.; do., August, at 32½c. bid and 33c. asked; No. 3at 33c.; ungraded white Western at 35@40c.; ungraded mixed Western at 32@35c.; white State at 45c.; No. 2 Chicago at 35c.

HAY AND STRAW.—Prices are well sustained with a good demand.

New hay quoted at 80c@$1; old hay, shipping at 80@85c.; retail lots at 90c.@$1 for medium, and $1.10@$1.15 for prime and fancy qualities; clover 60@65c. Straw at $1.05@1.10 for long rye; 60@65c. for short rye, and 55@60c. for oats.

Exports for week, 3,400 bales.

LEATHER.—Latest prices are 22@23½c. for light hemlock sole; 23½@25c. for middle do.; 23½@24c. for heavy do.

OIL CAKE.—Western is quoted at $32 per ton.

POULTRY AND GAME.—Supplies of dressed poultry have exceeded the summer wants of trade. Prices easier especially for scalded stock.

Turkeys, choice, small, on ice, 11@12c.; fair to good, 10@11c.; Phila., dry-picked, 11@13c. chickens, Spring, Phila., large, ₱ lb, 22@23c.; small, 20@21c.; State scalded, 17@19.; Western scalded 16@17c.; Fowls, Phila., dry-picked, 15@16c.; Jersey, dry-picked prime, 14@15c.; scalded 13@14c.; State, dry-picked, prime, 14c.; State, scalded, prime, 13c.; Western, dry-picked, prime, 13@13½c.; scalded, prime, 12@12½c.; poor to fair, 10@11c.; ducks, spring, dry-picked, large, 16@17c.; small, 14@15c.; Spring State, scalded, 13@14c.; Phila., old dry-picked, 10@11c.; squabs, white, per doz. $1.75; dark, $1@1.12.

Live chickens are abundant and easy in price. Fowls in light supply and well supported

Chickens, Spring, large, ₱ lb., 16@17c; small, 15@16c.; chickens Southern 14c.; fowls, Jersey, 14c.; Western, 13½@14c.; Southern, 13@13½c.; roosters, 6@7c.; turkeys, mixed, Jersey, 10½.; Western, 10c.; ducks N. J., N. Y. and Pa., ₱ pair, 55@70c.; Western, 45@55c.; Southern, 40@45c.; geese, Jersey, $1.50@1.75; N. Y. and Pa., $1.25@1.50; Western, mixed, $1@1.25; Southern, 87c@$1.12; pigeons, 20@35c.

Game has little representation and not much sold. Wild pigeons about the only quotable item; these great Bic flight: $1.50 stall-fed.

PROVISIONS—Hog products have been active and closed strong. Mess pork quoted $13.30@13.35 for July; $13.30@13.35 for August, $13.35@13.45 for September, and $13.40@13.50 for October. Bacon at 7½c. for long clear and 7¾c. for short clear Lard—Western steam at 7.15c for spot and July deliveries, 7.22½c for August 7.30c, for September, and 7.37½c, for October. Stearine at 8@9½c. for Western. Tallow at 6¾c. for prime. Beef hams at $23.50@23 for new. Beef—Extra India mess quoted at $16 for city; $10 for extra mess, and $9 50 for plain mess, $10.50@11 for packet, and $—for family mess.

Receipts for week, beef, 400 pkgs.; pork, 2,359 bbls.; cut meats 24,150 pkgs.; lard, 13 550 pkgs.

Exports for week, beef 2 350 pkgs.; pork, 3,900 bbls.; cut meats, 9 034,650 pounds; lard, 7,381 9.0 pounds.

SEED.—Clover is quiet at 7@7½c, for Western and 7½@7¾c. for State.

TOBACCO.—Export demand continues slack and generally trade is very moderate. Prices are steady and unchanged.

VEGETABLES—With abundant supplies of L. I. and N. J. potatoes, Southern are slow of sale. Prices cannot work up suddenly as the market has only a city outlet at this part of the season. N. J. and L. I., new bulk, per bbl., $1.25@1.10; Maryland, $1@1 50; Norfolk, prime, $1@1.25; Norfolk, poor to good, 50@75c. Corn is not fine yet. The demand for egg plant improves every year. Cabbages have declined. L. I tomatoes sell well considering the price. Norfolks not wanted at any price.

Green corn, Jersey, per 100, 50@$1.; tomatoes, Maryland, per crate, $1.75; L. I. and Jersey, per bush. $2@2.25; cucumbers, L. I. ₱ 100, 50@75c.; egg plant, Jersey, ₱ doz., $2; Fla., ₱ bbl., $2@4.50; string beans, L. I. round, ₱ bag, $2.25@2.50; Long Island, flat, per bag, $1.50@1.75; wax beans, L. I., per bag, $1.75@2.00; green peas, L. I., $4.50@3.50, turnips, Jersey, per 100 bunches, $3@4; Jersey, Russia, ₱ bbl., $1@1.25; beets Jersey, per 100 bunches, $2@3; radishes, red, 50@75c.; lettuce, ₱ bbl., $1.50@3; cabbage, Jersey, ₱ 100, $4@6; squash, Jersey, marrow, per bbl. $1@1.25; L. I., yellow, $1; L. I., white, $1; onions, Jersey, yellow, $4; State, yellow, $3.75@4; carrots, ₱ 100 bunches, $1.50@2.

WOOL.—Export demand continues slack and generally trade is very moderate. The market has been quiet this week, and the situation as to prices is unchanged.

LIVE STOCK MARKETS

NEW YORK, Saturday, July 17, 1880.

BEEVES.—Receipts for week 14,616 head; do last week 12,825 do. The offering was easily used and closing sales show an advance of $1 per head and in selected lots of steers ½c. per lb. Cherokees and Texans were sold at 7¾@8c to dress 55 lbs.; Colorado stillers at 8¾@9¼c. to dress 56 lbs.; corn-fed Coloradoes at 8¾@9¼c. to dress 56 lbs.; Ohio dry cows at $3.60 ₱ 100 lbs, and common to fair native steers were sold at 8¾@9c. to dress 55@56 lbs., with good to choice at 9¾@9¾c. to dress 56 lbs.; few extras at 10c.

COWS AND CALVES.—Some addition to supplies weakened an already slow market. No sales quoted this week above $45 the range is down to $35.

LIVE CALVES.—Small inquiry and free supplies have kept prices weak on all the selling days.

Live calves, N. J. and Bucks Co., choice, 5¾c.; prime, 5@5¼c.; State choice, 5@5½c.; State, prime, 4¾@5c.; do., fair to good, 4@4½c.; poor, 3@4c.; heavy, good to prime, 5@5½c.; buttermilk, 2½@3½c.; grass, 2@3½c.

SHEEP AND LAMBS.—Receipts for week, 35,379 head; do last week 31,537 do. The demand has not been sharp and the market closed dull and heavy without much if any change in prices for the week. Lambs opened very active and stronger, but closed weak at yesterday's prices. Sales of sheep were at 5¼@5c.; of Southern and Western lambs at 4½@6½c; of Pennsylvania and State do. 5½@6¼c, and of Jersey do, 7c.

SWINE.—Receipts for week, 20,579 head; do last week 21,016 do. Stock all to packers; nominal price for live $4.75@5 ₱ 100; city dressed 8-15@6¾c.

DAY'S Kidney PAD

A CURE for the most prevalent and fatal diseases that afflict mankind **FOUND AT LAST.**

Internal medicines never did nor never can cure **KIDNEY DISEASE. STOP IT NOW;** apply Day's Kidney Pad **AT ONCE.** and be cured of all affections of the **Kidneys, Bladder and Urinary Organs.** It is the only treatment that will cure **NERVOUS AND PHYSICAL DEBILITY,** and that distressing complaint, **"BACKACHE."** It will annually save many times its cost in medicines and plasters, which at best give but temporary relief. Sold by Druggists or sent by mail on receipt of price, **$2.** Our book, "How a Life Was Saved," giving a history of this new discovery and a large record of most remarkable cures, sent free. Write for it.

DAY KIDNEY PAD CO., Toledo, O.

THE FERGUSON BUREAU CREAMERY.

Surpasses all others in quantity and quality of butter made. It secures matured and ripened cream, which makes butter of the best texture, flavor, and of unequaled keeping quality. It excludes flies, dust and odors; is constantly at the correct temperature (58° to 60°); has room for the cream and butter, and saves three-fourths the labor. It can be used with either ice or water, and both summer and winter.

THE FERGUSON CONCUSSION CHURN is the best. It combines scientific principles with the best labor saving devices. No floats or paddles. Brings the butter in granular form, and secures the largest yield. Before buying any other **Churn or Creamer;** or any pans, or cans, send for large illustrated circular to **THE FERGUSON MF'G CO., Burlington, Vt.** Reliable Agents Wanted.

WILLIAMS NOISELESS THRESHER

SIZE OF THRESHER FOR 2 OR 3 HORSE TREAD POWER.

If you wish to purchase a **2, 3 or 4-HORSE RAILWAY POWER OR THRESHER; A 6 to 10-HORSE LEVER POWER OR THRESHER; A 6 to 12-HORSE STEAM THRESHER, and make the best investment of your money,** send for descriptive Circular and Price List to

M. WILLIAMS,
St. Johnsville, Montgomery Co., N. Y.

The Literary Revolution.

The most successful revolution of the century, and to American readers of books, the most important. Only books of the highest class are published by us, and the prices are low beyond comparison with the cheapest books ever before issued. To illustrate and demonstrate these truths, we send the following books, all complete and unabridged, **post-paid,** at the prices named:

Macaulay's
Life of Frederick the Great. Former price, $1,25. Large brevier type, beautiful print; **price three cents.**

Carlyle's
Life of Robert Burns. Former price, $1.25. Large brevier type, beautiful print; **price three cents.**

Light of Asia,
By Edwin Arnold. Former price, $1.50. Beautiful print, brevier type; **price five cents.**

Thos. Hughes's
Manliness of Christ. Former price, $1.00. Beautiful print, brevier type; **price three cents.**

John Stuart Mills's
Chapter on Socialism. Essays of exceeding interest and importance. **Price three cents.**

Baron Munchausen.
His travels and Surprising Adventures. Former price $1.25. Bourgeoise type; **price five cents.**

Mary Queen of Scots'
Life, by Lamertine. Former price $1.25. Brevier type, beautiful print; **price three cents.**

Vicar of Wakefield.
by Oliver Goldsmith. Brevier type, beautiful print; **price five cents.**

Bunyan's Pilgrim's Progress.
Bourgeoise type, leaded; beautiful print; **price six cents.**

Private Theatricals.
By author of "Sparrowgrass Papers." Small Pica type, leaded; **price two cents.**

Stories and Ballads
For Young Folks, by Ellen Tracy Alden; with very fine illustrations. Selections complete from her book. Large type; **price five cents.**

Leaves from the Diary
Of an Old Lawyer. Short stories of thrilling, laughable, pathetic interest. **Price three cents.**

Booksellers
Everywhere (only one dealer in each town) keep these and our large list of standard books, which are selling by the million volumes, because **the people believe in the Literary Revolution.**

TO A BREEZE.

FRANKIE M. BROOKS.

Cooling breeze,
Fan my brow;
Kiss the quivering forest trees,
Dance upon the brooklet. Please
Tell me how—
O'er the beauteous summer land,
And the restless summer sea,
And the yellow, yellow sand
Of the ocean's golden strand—
You have come.
Tell me where
You are from.
In the sunny land of Spain
Did you go?
Or amid the hills of France
Did you blow?
'Mid the stately spires of Rome.
'Mid the ancient towers of Greece,
And the temples of the East
Have you been?
Are you home,
Pleasant breeze?
Or still onward will you go
Over other lands to blow?
Scented sweet with orange flowers,
Will you spend your leisure hours
'Mid the leafy blooming bowers
Of the South?
Will you visit lemon groves?
Will you burst the cotton buds
In the sun?
Where we get our rice and cloves
Will you roam?

Sailing breeze,
Come again;
From the regions of the South
Come again.
You are welcome in this clime;
Dainty breeze, at any time,
With your singing and your dancing
You can set the leaves a prancing
On the ground.

Little breeze,
Take advice.
If you join with other winds
On a journey to the North—
To the fields of snow and ice,
To that grim mysterious pole,
With its great frost-bitten feet,
Where the ice-bergs drift and meet,
Where Boreas have full sway
All the night and all the day—
Please pass round another way,
Just to warm your freezing mouth
In the furnace of the "South,"
Ere you breathe on us again.

Now, good-bye.
O'er the beauteous summer land,
And the restless summer sea,
And the yellow, yellow sand
Blow again
Soft and free.
Whisk and whistle at your will
Through the cracks of yonder mill:
Dry the fresh mown fields of hay
Where the withering flowers lay;
Then return,
O'er the prairie and the hill,
O'er the woodland and the plain
To the bounteous West again,
To the butterfly and fern,
And to me.

THE GOLDEN ORIOLE.

I shall probably never again listen to a story of a bird with so much interest and delight as I have often listened to mamma as she repeated over and over again the pretty pranks and funny tricks of her pet oriole, which I never had the good fortune to see.

There are three pets which generally distinguish the home of a pet-loving family, viz: a baby, a bird and a kitten. And what family has not been heard to say that "we have the nicest bird," "the cunningest kitten," or "the sweetest baby that ever you saw in all your life!"

One morning papa found the oriole lying on the cold, wet ground, where it had probably fallen from the nest; he carried it home, for it was too young to fly, and there it received much attention.

My parents were at that time living very quietly, with no one but themselves in their household, no cat and no dog to torment the bird. This quietness, combined with kindness from all hands, tamed the little creature and made it as fearless as when it was in its mother's nest.

As it grew older it was perfectly contented, and would hop about on the floor and follow mamma wherever she went. When it grew older still (old enough to fly) it took flying lessons on the back of a chair; at first it would try time and again to fly from the floor to the round above its head, and with a great deal of labor would alight upon it, but the round being too large for its little feet it would always fall off. At last, after many failures, the persistent little thing succeeded, and then such an ado as it did make! Why, it fairly screamed with delight.

The old birds would come and call it occasionally, but although it would sit on the door-step and watch them, it never paid the least attention to their cries. Mamma never kept it caged, and that was one secret of its being so tame, for whenever she put it with the canary for a little while it would become as cross and excitable as any other bird.

It soon became the great object of wonder and admiration in the neighborhood. When mealtime came and it heard the clatter of knives and forks, it would come flying in from out-of-doors. First it would alight upon the table and pick a green pea or a bit of potato from papa's plate, and then it would fly to his shoulder and eat the morsel. Then again it would go to mamma and get a drink—a spoonful of cream. It would alight upon her hand and take the drop from underneath the spoon, so as not to lose that, and then it would drink the rest of it with great delight. When finished, it would amuse itself upon papa's head in a dozen ways, by pulling his hair and nipping his ears all around and pecking into them.

Yes, indeed, the oriole was very fond of cream, and although the milk-room was the only place master "Birdie" was not allowed to frequent, he (it proved to be a male) once or twice entered the forbidden room, through a small crevice in the window, and then he helped himself to his favorite beverage, by skimming up great mouthfuls of it; and, when mamma made her appearance at the pantry door, he would throw out his head and scold her as much as to say, "You just let me alone now, if you please, madam. I know you have come to take me away." He always came at mamma's call, when within the sound of her voice, no matter where he might be When she would go to the door and say "Birdie!" "Birdie!" he would answer her with a short "Chr-r-r-r!" as much as to say—"I'm coming," which sure enough was true, for in a moment he would dart through the door-way, and right into her face, showing the greatest signs of joy at seeing her.

One day two little girls came to see mamma, and when she told them she had a pet bird, of course, they were very anxious to see it. So she went to the door to call him, and when, as usual, the little pet came rushing in, the children were spell-bound with astonishment. Oh! they "never saw such a darling bird!" and "where in the world did you get it!" and, "oh, how tame he is!" They were delighted beyond measure and tried to call him to them, but he would only come at the sound of mamma's voice. Another time the bird did not come when she called him, but when she said "Birdie!" "Birdie" he answered as usual, but each time fainter and fainter, as much as to say "I do not wish to come, I wish you would let me alone." Finally she saw him cuddled in between a row of half-grown chickens that were perched on a wheel-barrow close-by; he was very comfortable I suppose, and did not want to get out of his good position.

He was very fond of society, and dearly loved the little turkeys and chickens, for he was generally found in their company; sometimes in the coop, sometimes on the top of it, and often on the old hen's back. At first mamma was afraid to let him go with the hens and chickens so much, but they seemed to get along so peaceably together, and the chickens to enjoy his company so well, that security took the place of fear. He loved to play as well as a child, sometimes when mamma was sewing he would rush along and jerk the thread from her needle, and then he would light upon her finger and try to dig her thimble off with his bill. But his principal pleasure consisted in rolling the spools of thread out of her work-basket and tangling them up for her.

It happened one time that mamma locked up the house and went away. She had on a new sun-bonnet which Birdie had never seen her wear before, and when she came back and turned the key, she could hear him making little cooing noises, and a great deal of fluttering, just as he always did when he thought she was coming, but the minute she opened the door and he could see her, all was silence, not a sound was heard. Then she saw him crouched up in one dark corner, in an attitude of the greatest fright with his neck stretched and his wings hugged close to his body. Presently she spoke to him in a quiet, gentle tone, and the instant he recognized her voice, all fear vanished, and he was almost wild with delight; he flew right into her face; then he lit upon a chair; then he whirled around her head again and again, as if he could hardly express his joy.

But, alas, she was soon to lose her little pet. The last time she saw him he ate his breakfast out of her hand, as usual, and then flew out-of-doors. He had kept out-doors a good deal at that time, for an old Newfoundland dog had come out from town with some friends of mamma's that week, and the bird and Trip did not get along well together. After that morning he never came back, and mamma always supposed a hawk had caught him, for she saw one swooping down among the trees about the time she missed him. It was a sore loss to the household, I assure you. Mamma could not give him up for many weeks, but would often go to the door and call him, in the vain hope that he had strayed away and might come back again. He had grown to be such an affectionate little creature that it almost seemed as if some member of the family had left their hearth and home.

I believe that any oriole, if taken when quite young and made much of, can be nearly if not quite as easily tamed as this one; for I have heard that orioles are more susceptible of learning than any other bird.

This is a *perfectly true* story, and "I have told the tale as it has been told to me."

Cousin, Frankie M. Brooks.

LETTERS FROM THE COUSINS.

Dear Uncle Mark:—I have not seen any letters from this county, so I thought I would write. I would like to join the Horticultural Club if you will accept me as a niece. I am 14 years old. My father has taken the Rural New-Yorker two or three years, and he likes it very much. We have a good many flowers. I will give you the names of a few: Roses, Lilies, Pinks, Petunias, Violets, Pansies, Verbenas, Sweet William, Marigolds, Lantana, Honeysuckles, and a number of kinds that my father received from the Rural. We are three sisters and one brother in our family, and one brother is dead. We live 14 miles from Sacramento City on a ranch, and go four miles to school. I have seven studies. My father owns 800 acres of land, and he keeps 2,000 sheep, fifteen horses and other stock besides. Our pets are two Guinea pigs, two cats, two canary birds, one gold fish and two colts. They belong to my baby brother, Johnnie, who is eight years old. If this letter is too long, and not worthy of publication, cast it in the waste basket. This is my first letter. Ettie Plummer.

Sacramento Co., California.

Uncle Mark:—We once again write to you to thank you for the seeds sent us. Our flowers from the seed sent are doing so nicely. The portulaca is blown; we had several colors, but what you sent us is not like ours. The Surprise melon is growing nicely; it has been very dry until two weeks ago. All our seed did well, but the seed you sent papa did not all grow. We told mamma she had taken too much pains with hers. You ought to see her Golden Ovoid mangels, they are so large. The bronze lettuce was splendid this year, as was the Acme tomato. She has no other kind of tomatoes. We all think a great deal of the Rural plants. We are striving hard to have pretty flowers, but there is a kind of insect, or worm, eating some of them in the heart, and they fall off on the ground. What must we do with them? But perhaps this wet weather makes them worse. From your little friends,

Lizzie, Barbara and Eliza Pound.

Spencer Co., Ky.

Dear Uncle Mark:—As you said in the Rural that the names of the cousins who did not report would be dropped, I guess I had better report. I planted some of the corn I received last Summer, but it was too late to make even stalks. The rest I planted this Spring. It is just up. The flower seeds I did not have time to plant. I have planted some beans and potatoes, which are doing finely. Only three of the grape seeds have made their appearance. Peaceable Bob is right, about the young ladies quarreling, and they had better be keeping the chickens out of their flowers than be prowling about graveyards. Jay-hawker.

Johnson Co., Kan.

Dear Uncle Mark:—I am twelve years old. I have been wanting to write you for nearly a year. I seeded nearly 70 acres last Spring, and harrowed it in. I began to work in the garden when I was six and I have made most of the garden for three years. Now, have I done enough to claim a place in the club? If you think so, put me down, if you please, George U. Watson.

Daviess Co., Ill.

Various.

BRIEFLETS.

At the beginning of the present century there were 3,000,000 copies of the Bible in existence; since then 116,000,000 more have been printed. The fact that politicians are, if possible, growing worse and worse is abundant proof they have been injudiciously distributed. . . . . "No," said Le Due, "I do not expect to be re-appointed by the next President. No one will ever appreciate my tea as the present administration has."—Puck. . . . . Many persons who rake through another's character with a fine tooth comb, to discover a fault, could find one with less trouble by going over their own character with a horse-rake.—Whitehall Times. . . . . A simple experiment in pneumatics is one mentioned by Tissandier. Place some burning paper in a quart bottle, full of air. After it has burnt a few seconds, a hard-boiled egg, with the shell off, is placed in the mouth. The egg is pressed inward by the atmosphere (the combustion having caused partial vacuum); it gets more and more elongated, and at length wholly enters the bottle, with a slight detonation. . . . . Ham and other flesh infested with trichinæ have been treated with alcohol and salicylic acid, and upon examination the parasites had entirely disappeared. Hence it is proposed to cure persons thus affected in the same way. . . . . The Boston Journal of Chemistry says that the attempts of oleomargarine manufacturers to convince the public that beef tallow, or "suet," as tallow is usually called by the compounders, is "just as good" as butter, are very absurd. The difference between good butter and the cleanest specimens of the oleomargarine mixture is "heaven-wide." . . . . . Anthurium Scherzerianum Rothschildianum is the graceful and simple name of a new flamingo plant. . . . . The Connecticut Farmer says that Mr. Erastus Bailey, of Little Compton, R. I., has kept 1,000 to 1,200 hens during the past five years, and realized from each an annual profit of $1.15. The question is, if he can do that, why don't he increase his flock to 2,000 or 2,400 and realize double the aggregate amount? . . . . . It is well to cut off the asparagus tops before the seeds ripen. . . . . Mr. Warner says: Nothing shows one who his friends are like prosperity and ripe fruit. I had a good friend in the country whom I almost never visited except in cherry-time. By your fruits you shall know them. . . . . Messrs. Ellwanger & Barry, we are glad to see, regard Cornus florida (our Flowering Dogwood) as one of the best of trees for ornament. They rank it next to the magnolia among flowering trees, and second only to the Scarlet Oak (Quercus coccinea) in brilliant foliage in Autumn. No reference is made, however, to its showy fruit. . . . . Onions should be found in *every* garden. How could the Dutch or those who pattern after them in their cooking, get on without them? In onion is strength; and a garden without it is devoid of sprightliness. . . . . "The onion in its satin wrappings is among the most beautiful of vegetables; and it is the only one that represents the essence of things. It can almost be said to have a soul. You take off coat after coat, and the onion is still there; and when the last one is removed, who dare say that the onion itself is destroyed, though you can weep over its departed spirit! . . . . . Happy is said to be the family which can eat onions together. They are, for the time being, separate from the world and have a harmony of aspiration. . . . . There is a hint here for the reformers. Let them become apostles of the onion; let them eat and preach it to their fellows, and circulate tracts of it in the form of seeds. In the onion is the hope of universal brotherhood. If all men will eat onions at all times, they will come into a universal sympathy. . . . . A teaspoonful of carbolic acid in two gallons of water is said to prove as destructive to the currant worm and rose bug as hellebore. . . . . In France the children attending 30,000 primary schools in the rural districts, receive instruction in the culture of the soil. . . . . Ralph Waldo Emerson keeps two cows and milks them himself. Some of his brightest thoughts have come to him while being kicked half-way across the stable.—Detroit Free Press.

CATALOGUES, ETC., RECEIVED.

Cottage and Villa Architecture is the title of a handsome large folio volume on architecture, published by Bicknell & Comstock, 194 Broadway, New York. The work contains thirty-four designs of wooden and brick buildings in sixty-six finely executed plates. The plates show plans, elevations, sections and details of low-priced, medium-costly and first-class cottages, villas, farm-houses and country-seats. The work is designed to assist persons who wish to build, by laying before them a large variety of plans from which selections can be made, or valuable suggestions given as to the most desirable construction of a dwelling. The plans are drawn to scale, so that experienced mechanics can work from them without further directions from architects. But few printed descriptions are given, because the drawings themselves are so readily understood as to make descriptions superfluous. On the whole, it is a work that cannot fail to prove of value to all who wish to build without the aid of an architect, and the moderate price, $6.00, may save hundreds by the suggestions that may be garnered from the plans.

Strawberry Circular. J. T. Lovett Little Silver, Monmouth., Co New Jersey. This is devoted entirely to strawberries—pot-grown and layer—for the present Summer and Autumn's use. The "Marvin" is made a specialty This new seedling was sent to us by Mr. Marvin two years ago. It fruited once and our impression was so favorable that we commended it to Mr. Lovett who with characteristic promptness, purchased a large number of plants. Unfortunately our own plot of the Marvin was accidentally destroyed: But we are glad to note that its promise with us is likely to be amply fulfilled.

Catalogue of Purdue University, Lafayette, Ind., for 1879-80. The catalogue contains the names of the officers, faculty and students, and gives a complete idea of the several courses of study that may here be pursued. The institution originated under the Act of Congress which donated lands to the several States for the maintenance of agricultural colleges, and its leading object is to teach agriculture and the mechanic arts. The agricultural course, under Prof. C. L. Ingersoll is complete and thorough-going. A model farm of 150 acres is connected with the institution.

Annual catalogue of the American Veterinary College No. 141 West Fifty-fourth St., New York City. This institution has been in existence for sixteen years, and offers a thorough course in every department of veterinary science. A free scholarship is offered to each State Agricultural Society in the country. The applications for these must be made by the societies to the Dean of the Faculty, Professor A. Llautard, on or before the first of September of each year.

Constitution, By-laws, Rules and Regulations, with premium list of the Winnebago County Agricultural Society of Ill; to be held in Rockford, Ill. September 13th to 17th 1880. Some twenty pages of the pamphlet are devoted to the annual report of the secretary of the society.

Catalogue of Lasell Seminary for young women at Auburndale, Mass., for 1879-80. This institution graduated its first class in 1854 and has since maintained an excellent reputation as among the best educational institutions especially designed for young ladies.

List of premiums, Rules and Regulations of the Des Moines County Agricultural Society's Fair, to be held at Burlington, Iowa, Sept. 21, 24, 1880.

E. S. Miller, Wading River, Long Island, N. Y. Price-list of seeds of Native Trees, Shrubs and herbaceous plants for Fall of 1880.

PERSONAL ITEMS.

General Garfield has named the new home he has just finished at Mentor, Ohio, "Lawnfield." He preferred "Rudolphia," after his wife's maiden name, but she objected.

Mrs. Hancock is a regular attendant of the Protestant Episcopal Church. The little church on Governor's Island, which is supported by Trinity Parish, has been attended by Mrs. Hancock durind her residence at that station, and she has in fact contributed to the service by regularly playing the organ for the Sunday gatherings there.

Ex.-Gov. Garcelon, of Maine, the prime mover in the disturbances in that State at the last election, it is reported, is "broken down and despised," that the rebukes of his pastor have driven his family from his church, and that the loss of a lucrative medical practice at Lewiston, Me., has forced him to give up his fine residence and take rooms in an humble tenement.

Miscellaneous.

XX COT (not painted, White Duck) $2.

Makes a perfect bed. No mattress or pillows required. Better than a hammock, as it fits the body as pleasantly, and lies *straight*. Folded or opened instantly. Self-fastening. It is just the thing for hotels, offices, cottages, camp-meetings, sportsmen, etc. Good for the lawn, piazza, or "coolest place in the house." Splendid for invalids or children. Sent on receipt of price, or C. O. D. For **50 cents extra**, with order, I will prepay expressage to any railroad station east of Mississippi River and north of Mason and Dixon's Line. For **75 cts.** in Minnesota, Missouri and Iowa. **HERMON W. LADD, 108 Fulton St., Boston**; 207 Canal St., New York; 165 North Second St., Philadelphia; 94 Market St., Chicago, Ill. **Send for Circulars.**

20 New Styles Chromo Cards, 10 cts. Best ever sold. Stamps taken. J. B. HUSTED, Nassau, N.Y.

20 Gold and Silver Chromo Cards, with name, 10c. post-paid. GEO. I. REED & Co., Nassau, N. Y.

52 Gold, Crystal Lace, Perfumed & Chromo Cards name in Gold and Jet, 10c. CLINTON & BRO., Clintonville, Ct.

New Publications.

O. DITSON & CO. are Sole Agents for the United States for the extensive catalogue of

The Monitor Jr. is the most perfect Clover Thresher, Separator, Huller and Cleaner in the world. The Threshing and Hulling Cylinders run under-shot. They also continue to manufacture the old "Monitor," with *Threshing* and *Hulling* Cylinders running *over-shot*. Send for price list, terms, and descriptive catalogue. Address as above, and say you saw this in the RURAL NEW-YORKER.

MINNESOTA CHIEF!

The Best Thresher on Wheels!

It is not a vibrator, neither is it an apron machine, but the best points of both are combined, with new and original features of its own. It is wonderfully simple in its arrangement. It is admirably perfect in its threshing and separating qualities. It saves all the grain, and cleans it ready for market. It runs easily, is constructed durably, is finished beautifully, is the most economical, least expensive, and altogether the most satisfactory machine in the market.

It will handle wet grain as well as dry. In threshing Flax and Timothy it has no equal, threshing and cleaning both as well, and nearly as rapidly, as wheat, and requires no change except the sieves. It has more square feet of separating and cleaning surface than any other machine made, and cannot be overloaded. It is both over and under blast at the same time.

Our clover hulling attachment is a new and very desirable feature. It does the business more rapidly and better than an exclusively clover hulling machine.

Separators of the various sizes fitted for Steam or Horse-Power, as desired.

An Improved Pitts Power, an Improved Woodbury Power, and the Elwurd Equalizing Power, all mounted on four wheels, are manufactured by us, and are not surpassed by any in the market.

DURING JULY ONLY!

During the month of July subscriptions will be received for the **CHICAGO WEEKLY NEWS**, extending from the date of receipt to January 1st next for **TWENTY-FIVE CENTS.** The **CHICAGO WEEKLY NEWS** is a large 32-column paper, edited with special reference to the needs of the family circle. It is especially complete as a *news* paper, every issue presenting complete telegraphic reports of all important happenings the world over. Its **Chicago Market Quotations** are full and trustworthy. It is **Independent in Politics**, giving all political intelligence free from partisan coloring, and discussing political questions without fear or favor as to parties. Condensed notes on **Art, Literature, Science, Industries, Fashions**, etc., and **SIX COMPLETED STORIES** in every issue. It is the cheapest metropolitan weekly published in the United States, costing only **SEVENTY-FIVE CENTS A YEAR.**

To afford all desiring an opportunity of becoming acquainted with the character of the **CHICAGO WEEKLY NEWS** before subscribing for a year we make this special offer for the **MONTH OF JULY ONLY** of sending this paper from date to January 1st next for the nominal price of **TWENTY-FIVE CENTS.**

NOTICE—That this special subscription term includes the entire Presidential Campaign and extends two months beyond—to Jan. 1, 1881.

A 25c coin may be safely sent in a strong envelope. A club of five subscriptions for a One Dollar Bill. Address, **VICTOR F. LAWSON, Publisher, 123 Fifth Avenue, Chicago, Ill.**

Trade **LONDON PURPLE.** Mark

Valuable Insecticide for the extermination of the COLORADO BEETLE, COTTON WORM and CANKER WORM. For Prices, Circulars and opinions write,

HEMINGWAY'S LONDON PURPLE COMPANY, (Limited) 90 Water St., New York.

Professor C. V. Riley says: London Purple can be more effectually sprinkled or sprayed on to the plant than Paris-green, by virtue of its greater fineness.

Professor C. E. Bessey says: It promises to be a most excellent remedy. It quickly kills both the Larva and the Winged Insects.

Professor J. L. Budd says: A single application placed every one of the pests on their backs over the ground either dead or in a dying condition, in less than six hours.

Implements and Machinery.

CORTLAND WAGON COMPANY,

Manufacturers of Platform Spring Wagons, Open and Top Buggies, Business and Road Wagons. These Wagons and Buggies are perfectly adapted to meet the requirements of all classes of *Business Men*, but the Platform Spring Wagons are especially designed for the use of *Farmers* and *Dairymen*. All work is fully warranted in every respect.

A finely Illustrated and Descriptive Catalogue and Price List furnished free upon application. Address

Humorous.

THERE may be "just as fine fish in the sea as ever were caught," but the trouble is to hook them.—Bloomington Hawkeye.

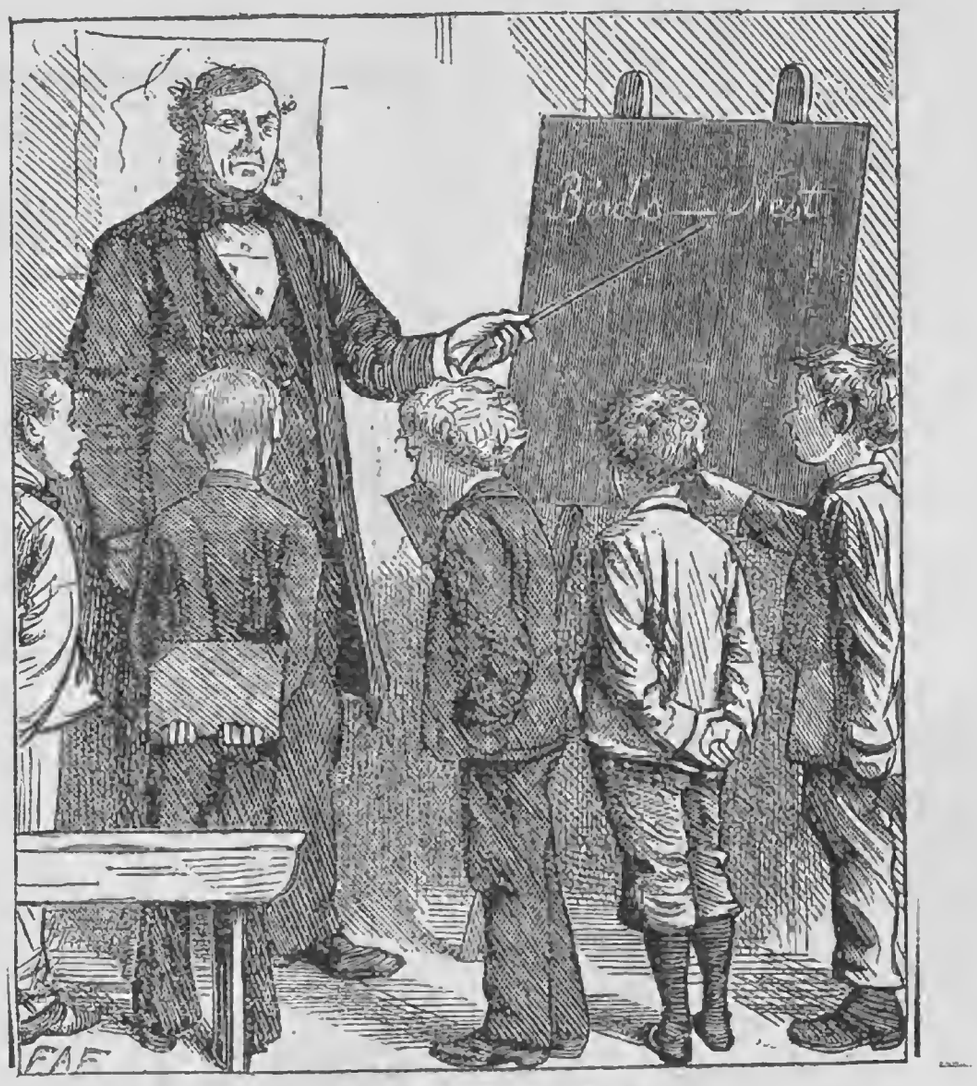
"If I have ever used any unkind words, Hannah," said Mr. Smiley reflectively, "I take them all back." "Yes, I suppose you want to use them over again," was the not very soothing reply.

WHAT was it? I went out into the woods and got it. After I got it I looked for it. The more I looked for it the less I liked it. I brought it home in my hand, because I couldn't find it. A sliver.

WAITER: "Do you wish to be called in the morning, sir?" Guest: "Yes, sir." Waiter: "When will you be called, sir?" Guest: "That depends upon how I feel in the morning. I am very tired now. I'll ring for you when I shall desire to be called."

A Host of Disorderly Symptoms

Follow fast upon irregularity of the bowels. The liver is thrown out of gear, the stomach is hampered by undigested food; flatulence, heartburn, sick headaches and uneasiness in the region of the liver infallibly ensue. But by breaking the partial blockade which produces them, and opening the avenue of discharge with that superlatively fine aperient, Hostetter's Stomach Bitters, a reform of these disorders speedily takes place. Nothing can be more dissimilar from the action of a drenching purgative than that of the benign alterative named. The laxative effect is produced without pain or inconvenience, and the excretory organs are invigorated as well as relieved, which is not the case when they are abruptly coerced into action with a cathartic of inferior efficacy and violent operation. The use of the Bitters will soon be found by any one of constipated habit, to be productive not only of the special result sought, but of general benefit to health.



OFF HIS PERCH.

SCHOOL-MASTER (who has been carefully explaining the use of the "hyphen"):—"Now, boys' here I have written the compound word, bird's-nest. What is the use of this bar in the middle?"

Chambers's Encyclopædia.

15 Vols. Over 13,000 Pages. Price During July, $6.25.

Among the wonderful things which have been accomplished for lovers of good books by the "Literary Revolution," perhaps the most wonderful is the reproduction of this great Encyclopædia at a merely nominal cost.

It is a verbatim reprint of the last English edition, in 15 beautiful volumes, clear nonpareil type, handsomely bound in cloth, for **$7.50**; the same printed on finer, heavier paper, wide margins, and bound in half Russia, gilt top, price **$15.00.** The first ten volumes are ready for delivery. Vol. 11 will be ready July 10. The remaining volumes will be completed by October next.

$6.25. An Amazing Offer. $6.25.

The more widely and rapidly these volumes are scattered, the greater is their influence in inducing other purchasers of this and our many standard publications. Accordingly we give special terms to early subscribers.

To all whose orders and money are received during the month of July, we will supply the 15 volumes, in cloth, for **$6.25,** and in half Russia, gilt top, for **$12.50.** To any one sending from any place, where we have no special agent (usually the leading bookseller of the town), a club of five orders, we will allow a commission of 10 per cent. The volumes issued will be sent at once by express, and the remaining volumes when completed.

A specimen volume in cloth will be sent, post-paid, for 50 cents, or in half Russia, gilt top, for **$1.00,** and may be returned at once, if not satisfactory.

The "CHAMBERS'S ENCYCLOPÆDIA" comprises the first 15 volumes of our "Library of Universal Knowledge," and the remaining volumes, complete in themselves, will be sold separately when published.

Standard Books.

Library of Universal Knowledge, 21 vols., **$10.50.**

Dairy Husbandry.

THE DAIRY COW.—No. 3.

HENRY STEWART.

How to Choose a Cow.

SOME persons have a sort of intuitive discrimination in judging of a cow. This is the result of experience as well as of a peculiar indescribable sense of fitness; for the general appearance of a good cow carries with it to the mind a very complete sense of "the fitness of things." The chief points about a cow are the udder and the teats; for the former secretes the milk and the latter convey it to the pail. The udder should, then, be capacious and the teats of convenient and pleasant size, well shaped and well placed for the use of the milker. The most capacious udder is one that has large extent at the junction with the cow's body; it should be broad and extend far back behind, and should be broad and come well forward in the front. It should not hang down and come to a point, but should be squarely formed and of a flattish, spheroid shape on the under part. Herewith is given a portrait from a photograph of my cross-bred Jersey and Ayrshire cow Nellie 2d, which I consider a model cow for the family or for a dairyman; for, as I have said, what is good for one is good for the other; although the family cow may very justly have more beauty than the matter-of-fact, business cow of a dairy. But the points of a good cow by which a judgment in choosing her can be accurately formed are as valuable to the dairyman as to the head of a family. The udder of this cow, which is not yet three years old, is large enough to hold eight quarts of milk at once, and the teats are placed so far apart, and are of such convenient size for the hand and the milk flows from them so freely that the eight quarts of milk can be drawn in six or seven minutes, easily and without any fatigue to the hands or the wrists. The teat should be long enough and large enough to fill the hand completely to make the milking easy.

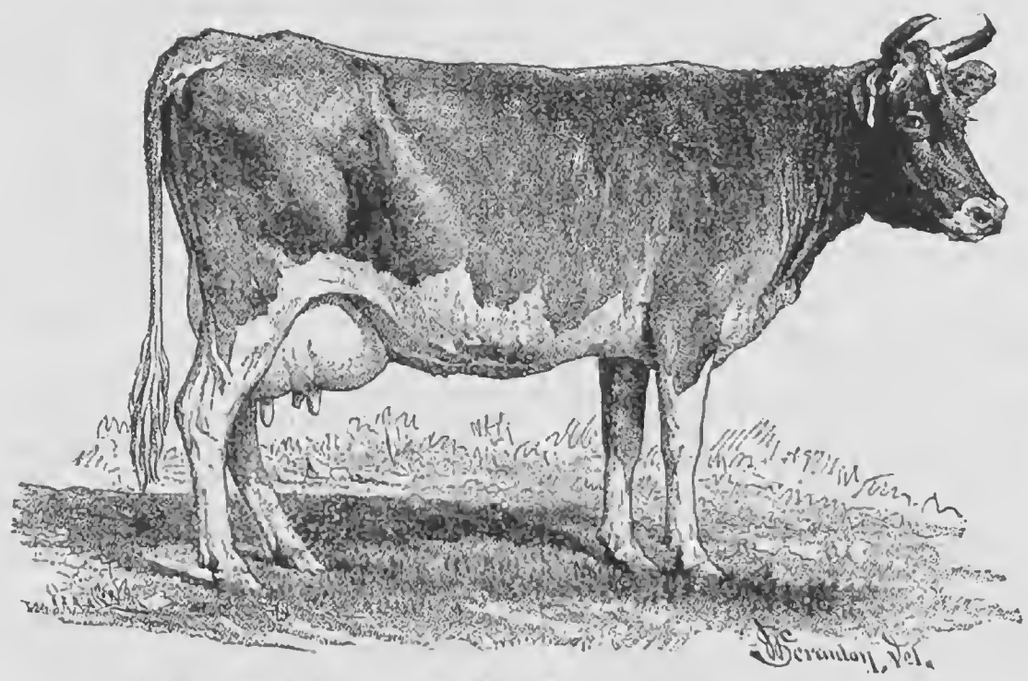
The udder of an animal is supplied with the blood from which the milk is secreted by the branches of the posterior, abdominal or mammary artery, which emerges from the external pudic trunk, one of the most important arteries of the system. The veins which complete the very highly developed circulatory system of the udder pass on to the abdominal subcutaneous vein which is prolonged forward on the wall of the abdomen and has an enormous volume in the cow. This vein is known as "the milk vein," and its volume is one of the common tests by which a good cow is judged. It passes from the front of the udder to near the chest or brisket, where it passes through to join the internal thoracic vein. The importance of the circulatory arrangement of the udder justly entitles the development of the milk vein to be considered as a test of great value in selecting a good cow.

As the blood from which the milk is formed is supplied by the digestive apparatus, the next point to consider is the form and capacity of the abdomen. A capacious stomach is consistent with the habit of a generous feeder, and the development of the abdomen, with the resulting wedge-like form of the body, is the third point of promise in a good cow. At the same time the food consumed should be well digested and thoroughly assimilated, and the other digestive organs should be equally well developed as the stomach, otherwise a paunchy appearance would be given which would indicate a gross feeder rather than a hearty, healthy and profitable one. Therefore the whole form should be well balanced; the chest wide between the ribs behind the shoulders, to give ample room for the lungs and heart, and the back broad and straight. As the whole force of the system should have been educated to expend itself in the production of milk and butter, the carcass should be finely built, the bones fine, the muscular portions—as the legs, head and neck—should be fine and thin and no waste material in bone, flesh and fat should be found in the carcass.

The extremities should be delicately formed, the tail long and thin except at its root, which should be large and strong; the muzzle should be fine; the head long, flat and thin, but broad across the eyes to give room for a large brain, which is the foundation for a highly developed and active nervous system; the horns fine, thin and neatly curved; the eye bright and active, agreeing with the active brain, but calm, quiet and mild in expression, significant of a quiet, contented disposition, and one not readily disturbed or worried. As the secretions of the body all come from the blood, and as a rich, yellow color is desired in the butter, so the skin should be filled with a yellow pigment, and the inside of the ears and the thighs, and other places where the hair is light and the skin plainly visible, should be of a rich orange color; so the scales of ear wax should be of the same color. The hair should be fine, smooth and silky, and, in short, the whole appearance should be satisfying to the eye and consistent one part with another and well balanced.

Some persons lay great stress upon the escutcheon as a distinguishing feature of a good cow. This is the growth of hair upon the rear part of the udder and thighs upward. The hair is reversed in position and grows upward instead of downward, with various curls here and there. Upon the peculiar shape and extent of this varied growth of hair and the position of the curls, the advocates of this test base their opinions of the character of the cow. A well-formed escutcheon, broad, well defined at the edges, with distinct curves on the lower part of the rear of the hams, is supposed to denote a large capacity for milk and a persistent habit of milking up to the next calving. An ill-formed or defective escutcheon is held to denote the reverse. It may be that this test is a good one. I do not believe in it further than this, viz: that a calf with a well-formed escutcheon, inherited with other favorable characteristics from a similarly well marked and good cow, will in all probability inherit the good qualities of its dam, as it inherits all her marks. But if the dam is a poor cow, I don't believe an escutcheon, however perfect it may be, will make a good calf. I have had poor cows, and have seen poor cows, that have had most excellent escutcheons, and have had good cows that have produced calves as good as or better than themselves, that have had no escutcheons worthy of notice except for their inferiority.

The cow Nellie 2d is three years old. Her mother made 14 pounds of butter in a week. With her first calf, Nellie 2d has made 8½ pounds of butter weekly, and after six months' milking and being two months in calf, has not failed the least in her milking. She is solid fawn with light-grey fawn legs; she possesses all the black points of the Jerseys, black nose, tongue, eyes, hoofs and switch; has a remarkably deep yellow colored skin, and if she were pure-bred, with a pedigree as good as herself, might possibly sell to a fancy breeder for $1,000. Her Jersey blood is of the very best, but her lineage is blotted, for she has one-eighth part of pure Ayrshire in her blood, and I think as a family cow she is all the better for that. For a cow for family use, or for profit in the dairy, is none the better although she have a noted pedigree; and is none the worse wanting it if she produces the requisite quantity of milk and cream, is possessed of all the cow virtues, "is gentle and is kind" and sufficiently good-looking to please her owner. But the family cow may be of high or low degree. She may be a scrub of the commonest breeding, homely and modest in her appearance, and may cost but $25, and yet her milk will taste as well and her butter may be as good as that of a more highly bred and handsomer cow for which her more wealthy owners may give $50 or $100. The poor man's cow, however, must be judged by the same tests as the more costly cow and if a would-be owner of a cow has but $25 or $30 to spend for the acquisition, he should be very choice in selecting the best he can get. As to color, a good cow may be of any color. I have had one remarkably good cow that was black and without horns, but in form and figure she was otherwise without a fault and was a model; but usually black cows do not turn out well, neither do white ones. Color depends somewhat on the breed, for color is a distinguishing part of some breeds, and this point will be explained further on. But a cow of no particular breed, and that has a desirable form and other good points, may be chosen as regards color according to the following scale, viz: first, brindle (yellowish-brown ground with black stripes intermingled and gradually shaded down), then yellowish brown; light red and white patched; light red; and darker red last. It is rarely that a dark red, solid-colored cow holds on to her milk for a long time, for she has the general falling of the Devon race from which she inherits her color.



NELLIE 2D.—DRAWN AND ENGRAVED FROM A PHOTOGRAPH.—FIG. 341.

JERSEY MILK AS AN ARTICLE OF DIET.

IF writers would quote and readers would understand the statements in regard to Jersey milk which we made several years since, which Dr. Hoskins, in a recent article in the RURAL, misquotes, there would be no grounds for so much display of rhetoric. We stated that, from the experience in our own family, the milk from our Jersey cows was too rich for babies; they could not digest it. When it was diluted with water there were no bad effects.

This is not arguing "the pernicious nature of Jersey milk as an article of diet." For children other than babies and for grown people, especially for those who rely upon milk as the principal article of food, we would recommend Jersey milk. It is for the delicate stomachs of infants that our warning was intended, when given to them without dilution. This is simply a question of fact, sustained by Dr. Sturtevant and myself. No doubt many others have observed it. We recently sold a Jersey cow giving exceedingly rich milk to a gentleman who lives almost exclusively upon milk, and he found that this milk agrees with him perfectly, as he is not obliged to burden his stomach with a large quantity of fluid in order to obtain a proper amount of substance for physical support.

Jersey milk is emphatically concentrated food, and a small quantity, either as food or in the dairy, goes a good ways.

F. D. CURTIS.

Farm Topics.

COUNTRY LIFE.

Observations Among Rural Subscribers.

COL. F. D. CURTIS.

FREDERIC CURTIS is one of our model farmers. He practices a mixed husbandry and follows the old-fashioned rotation of crops which he believes is the best suited to his farm. He turns over a field of green-sward for corn, which is followed with oats, which, in turn, is re seeded with wheat or rye. He applies manure to the sod, spreading it upon the surface and plowing it in. He always raises an extra-good crop of corn because he cultivates it well in the Spring, which gives it a good start, and then when earing time comes, it has the decaying manure and sod to feed upon, which insures long ears and plenty of them. Mr. Curtis has the merit of fixed ideas, and one of them is, that he has the best kind of corn. He always clinches his argument about his method of raising corn and its superiority by pointing to his corn crib. He says that so long as he can grow such cribs of corn, "what sense would there be in his changing his system, or his seed." This is all true with Mr. Curtis; his soil is warm, a gravelly loam, quick to germinate, and his land strong—natural corn land. With other soil, not so favorable, Mr. Curtis might make changes adapted to circumstances. His corn is a sort of family pet, which he has brought up himself to perfection.

He has made it "thoroughbred" by growing good crops and selecting the best ears. It is at home on his farm and has become adapted by years of continuous culture to the climate and soil. This is the way to make good seed and good crops. Both go together. Hence, Mr. Curtis by holding to his opinion, also holds the key to success. He has the finest crop of wheat hereabouts and this is not the first year that he has excelled. He draws all the manure remaining in his barnyard, however coarse, after the corn has received its share, into the oat field while the oats are growing, and throws it into large piles, where under the influence of the rain and sun it rapidly decays and becomes fitted to spread upon the surface. When the ground is plowed for wheat, it is harrowed in with the seed. Clawson and Michigan White wheat are both grown, the former being relied upon as the surest crop. Mr. Curtis has practiced for several years a departure from his former rule—to wit—sowing his clover as well as Timothy seed with his wheat in the Autumn instead of the Spring.

In this way he escapes the danger of Spring drought, and his clover being earlier, he gets a great deal of pasture from it the succeeding Summer.

Mr. Curtis has an appreciative idea of manure. He believes that it is better for a farmer to purchase stock in the Fall and bring them upon his farm to consume the fodder, even though in the Spring he may not sell them for any more than the purchase price, the manure repaying him both for what the fodder might bring if sold, and the labor of attending the stock. Mr. Curtis, like Mr. Morehouse, has improved his cows by Jersey crosses, and his dairy ranks among the best. He purchased his farm of Esquire Davidson, who had brought it to a high state of culture. Esquire Davidson sold this farm for more than twice as much as he originally paid for it. He wisely invested his surpluses year by year in ditches, convenient buildings and higher cultivation. His farm was his savings bank, which Mr. Curtis bought, paying the principal and a much larger interest than if the money had been invested in the usual way. Esquire Davidson had a yearly showing which afforded him more satisfaction, besides being more sensible, than a few figures in a bank book. Banks might break but the farm was secure.

W. I. CHAMBERLAIN.

Illinois and Kansas.

I THINK the first settlers in any new country may safely count on hard times, reverses, trials and discouragements. They come in many and varied forms, but they are almost sure to come. The early settlers of this country—I mean of our own wooded eastern country—expected it and they were not disappointed. Some one less famous for proverbs than Solomon or even "Poor Richard" has said, "Blessed is he that hopeth for nothing, for he shall surely receive it." Now our forefathers expected no ease or luxury at first, and they were not disappointed. With stalwart blows and long and patient labor they cleared the heavy forests and planted their corn among the stumps and roots. The utmost frugality must be practiced, and even then they were sometimes reduced almost to starvation. Years and years of toil were required to rid the fields from stones and stumps and fit them to raise more than a scanty subsistence for their owners.

But when the fertile prairies of Illinois were first opened up to us by the railways, and, earlier still, by the rivers, it was supposed all this was changed. The soil abounded in fertility and the air in moisture. All that was needed was to break up the fertile prairies and begin at once to reap rich harvests. But soon a new evil was discovered. This very fertility of soil and humidity of atmosphere were the sure causes and harbingers of disease and death. Malarial fevers abounded among the early settlers of Illinois. Chills and ague were the scourge of Illinois in early days. Health was ruined and constitutions broken, and thousands of the early settlers gave up their farms at a sacrifice of nearly all they had and returned disheartened and impoverished to their former homes in the Eastern States. But their places were filled by others, and as the country became more thickly settled and the swamps and low lands partially drained, disease diminished and prosperity and wealth increased till now it is one of the largest States in population, and one of the richest, indeed, probably the richest, in all our land in agricultural wealth. But it will not be so healthful as some others, nor so desirable for residence, until the low portions and swampy spots are underdrained so as quickly to remove all standing water after rainfalls and in Spring time. Stagnant water either on or in the soil will always be hostile to health and to fertility. The removal of this stagnant water, too, will tend to diminish the rainfall, now too abundant, or at least to distribute it more evenly through the growing season. I call attention to these facts to show that the settlement of Illinois, fertile and well watered as it was, was by no means an easy task; but, on the other hand, a most disheartening one. Charles Dickens long ago set this forth most vividly in his American Notes, and still more strikingly in his Martin Chuzzlewit, the swampy scene of which is supposed to have been laid in Illinois.

Now in Kansas the conditions were quite different. Here drought and not surplus moisture has prevailed. In most parts of the State, especially the western half, there was not that rank, tall prairie grass that so much abounded in Illinois before its settlement, but instead a low, tough "fuzz grass" that had a most forbidding aspect. Twenty-five years ago, as a friend of mine lately said, the whole State was hardly considered worth a nickel for cultivation, except along the streams. It was doubted whether the soil even had the elements of fertility in it, and it was a part of the Great American Desert. And then, too, the climate was deemed almost hopeless. Kansas was about the "divide" between the trade and the anti-trade winds; the place for winds and not for rains. But certain far-seeing men believed the soil to be naturally fertile, and that the rainfall would steadily increase, for reasons partly given in a former number of this series, as the area of population, tillage and growth of tree and leaf increased enough to bear any reasonable proportion to the area of "desert." The beliefs of such men have proved to be well founded. The crop statistics of eastern Kansas show that soil and climate now unite to make it one of the most fertile spots of earth. The splendid display of Kansas products—cereals, fruits and grasses—at the Centennial nearly four years ago, opened the eyes of the world to the desirableness of Kansas as a home for farmers.

Railway companies united with the general government and the State government of Kansas in offering inducements to immigration. The Kansas Board of Agriculture with its most able Secretary, Alfred Gray, now deceased, became in effect a bureau of immigration. Of course, a strong and even immense tide of population began to set in, all eager to choose the best sites before they should be all taken up. Many of them believed the first crop would pay for cost of its production and pay for the land, too. A large area was thinly covered, or rather long, narrow strips along each line of railway were sparsely settled, and the little patches and strips of corn and other grain bore no appreciable proportion to the immense area of desert plain, trodden hard by thousands of buffaloes for ages. Of course, the rain area was not perceptibly increased immediately, nor the area of "desert" diminished enough to induce any great increase of rainfall. Add now to this the fact that for two years there have been unusually severe and protracted droughts, and it will not be deemed strange that many of the settlers have become discouraged. Some are leaving for their former homes, hardly knowing whether to give up entirely or not.

Wisely, therefore, the State Legislature has passed a law permitting more than a year's absence from claims filed without losing the claim. Wisely, too, the railway companies are furnishing wheat for the fall sowing, taking pay, bushel for bushel, from the coming harvest. These measures will, of course, tend to retain population. Abundant rains have at last come nearly all over the State, and Winter wheat can in all probability be got in and have a good "send-off" for Winter. Those of the new settlers who have means to live it through will do so. Those who are obliged to give up entirely will, of course, be losers; but others will in time come in and take their places, and the State will be as well settled and as fertile through its western half as through its eastern. Indeed the best wheat lands are confessedly in its western half, and it is only a question of time when they shall be taken up and tilled and this part of the State present the same appearance of fertility, thrift and real agricultural prosperity that is now presented by the eastern half. For in spite of the long and unprecedented drought there, lasting from last November till June of this year, the fields show luxuriant and abundant crops. Indeed, the soil of Kansas withstands drought most wonderfully. It is light, deep and porous when properly worked in Spring, and retains moisture marvelously. If there is only moisture enough in Spring to give the corn a good start, it grows and matures even with very slight and infrequent showers.

To one who now rides through the western half of Kansas and the whole of Colorado, for the first time, the prospects of agriculture do not seem promising. But to those who carefully weigh all the historic and meteorological facts developed in the last 25 years in regard to Kansas, the outlook is hopeful for the future.

THE OUTSIDE AND THE INSIDE.

PICKING VS. POISON.—I have been looking over some agricultural journals of the East as I get the chance of reading, to find the acknowledgment from some Eastern grower, that when the Colorado beetle comes in force, it is as useless a task to undertake to subdue him by "picking" as it was for Mrs. Partington to try to sweep out the Atlantic with a broom, and have found it in a recent number of the Country Gentleman, a correspondent of which says, in a late issue, writing from Syracuse, N. Y. "The Colorado pest swarms beyond all former examples. Hills are frequently found having a hundred bugs. Hand picking is of no account, nothing but Paris-green is effectual".

And as a postscript to this piece of testimony to the efficacy of Paris-green, I have been surprised that it was not used to a greater extent than it is, to subdue the Army worm and other insect enemies of the cotton plant. In the upland cotton regions, cotton is mostly planted in comparatively small patches, as potatoes are in the North, and there is no reason why this crop cannot be saved from its numerous enemies as easily, and in the same way, as potatoes. Moreover, I have the impression that where one crop, or generation, or invasion of any insect has been met and overcome or destroyed by the use of substances like Paris-green, there is much less fear of a second serious invasion. At any rate, I find the Colorado beetle ten times less formidable than ten years ago, and I have found that one thorough going over of a field about the middle of June, discourages the bugs in a most encouraging way. But too much cannot be said in condemnation of the drug if used on cabbages and other vegetables cooked in the same or a similar way, and, if need be, its use should be regulated by a stringent law. I say this because several cases of violent and sudden attacks of sickness have come within my knowledge following the eating of early cabbage which I fear had been saved from the Cabbage worm by the use of Paris-green.

THE SCUPPERNONG GRAPE.—There is no reason why, after having furnished our friends across the water, with bread, meat and fruit, we may not, in the early hereafter, add "And drink, too," as per form and spirit of your editorial on page 420. But unfortunately for us of the northern portion of the country, our grape-vines and our vineyards have been attacked with diseases, which if they are not as destructive as the Oidium and the Phylloxera, we have at least not been able to treat successfully, as they have in case of the former with sulphur, and the latter by flooding the vines. From present appearance there can be no great increase in our vineyards, nor profitable production of wine from Northern varieties in northern latitudes, until the problem of grape blight, mildew and rot is better understood, nor until we understand grape growing as well as we do that of the cereals, and can produce both good grapes and pure wine with as much certainty as sweet and sound Indian corn and high-grade flour. However, we are beginning to comprehend that atmospheric conditions and influences and the phenomena of radiation and evaporation have a great deal more to do with successful grape growing than we had reason to suppose—but for further information on this point, I hope you will permit me to refer the reader to so much of Dr. McMurtrie's report as refers to the diseases of the vine, to be found in the Report of the Department of Agriculture for the year 1877, pages 81 to 89.

But if Northern varieties of the grape are subject to blight, mildew and rot, and if those introduced from abroad cannot be grown in the open air, there is at least one hardy native of the South, which, if under ordinary and careless treatment that does not consult the native habits and peculiarities of the vine it occasionally shows these diseases under a mild form, is at least the hardiest of all the grapes we have domesticated. This is the Scuppernong of the South, which is not frost-proof North, nor seen in its best form north of the southern line of Tennessee, in latitude 35 deg. I should not venture to assert on my own authority that the Scuppernong was capable of producing a dry wine of first-rate quality, and equal to the best Northern Catawba of the same kind, but having drank it at the tables of amateurs of undoubted judgment in such matters, both in Central Mississippi and Mobile, I am prepared to accept their conclusions, and especially since I was informed that both specimens were what all really good wine is—the pure juice of the perfectly mature grape, and without enrichment with sugar, dilution with water or reinforcement with spirits. Those who have never seen the Scuppernong in its perfectly mature stage, and therefore associate with it the foxy or vulpine acridity of taste and smell common both to the muscadines and the fox grapes, cannot understand how wine can be made from it, without retaining a repulsive *arriere gout*. But the best wine of this kind shows nothing of that nature and hardly a peculiarity which to average drinkers, would distinguish it from Catawba.

In the matter of the cultivation of the vine, it has a long time since been demonstrated that, in warm climates and in southern latitudes, the heat of the sun accomplished that for growth and development, which, in cold climates and northern latitudes, is effected by strong manuring and high cultivation; and, therefore, on the worn and poor soils of the South we see the native Scuppernong attaining a measure of healthy extension and fruitfulness, which, to Northern eyes and experience, is quite surprising, considering the poverty of the soil and the meagreness of the manurial and fertilizing additions made to it. But in the peculiar manner of the planting and training of the Scuppernong in Southern vineyards and gardens, one is surprised to recognize the facts as stated in the article alluded to above from Dr. McMurtrie, as to the importance of providing against too much evaporation from the leaves of the vine and the soil, and too much and too sudden radiation of heat from the earth's surface. Ordinarily Scuppernong vines are planted from 20 to 30 feet apart each way, and trained to stout stakes having a height above the surface of seven or eight feet. Upon these a horizontal lattice is extended from one stake to the other, so that when the vines have reached their bearing stage they form a green and level mass of herbage, making an arcade from which the rays of the sun are largely excluded. But while the roof of this arcade is sufficiently elevated to admit of the free circulation of the air, so much of the sun's rays are excluded as to prevent rapid evaporation of moisture from the earth's surface during the day-time, while during the night the same mass of herbage acts as a protecting cover and prevents that rapid radiation of heat from the soil which is so detrimental to vine vitality. But this screed is getting too long, and I conclude it in offering the suggestion that if Northern vines and varieties were trained something after the manner of the Scuppernong, they might, in that way, be made to furnish that protection from those atmospheric influences which is found in temporary half-roofs and other artificial means of shelter.

WINE MAKING.—I presume a considerable quantity of wine will be made from the Scuppernong the coming vintage season, for the area of Southern vineyards is now considerable, and is increasing in a most promising fashion; and I should like to have the opportunity to say to Southern wine-makers they must bear in mind that true and good wine is nothing more or less than the pure juice of the fully-matured grape, and that they must avoid any and every form of sophistication with sugar, or water, or alcohol. The first great error of those who do not know the world's judgment as to what constitutes good wine, is that it must be sweet; and the second, that it must be strong in alcohol; and they are apt to think that the must of unripe grapes can be made into good wine if sufficient sugar is added to conceal the acidity and furnish the saving complement of alcohol. There never was a greater error. The acid in the must is not lessened by sugar, though it may be concealed, and the alcohol produced from added sweets has a deleterious effect on the consumer out of all proportion to the same amount eliminated from grape-sugar through natural processes. By all means, then, let those who have Scuppernong vineyards and intend to make wine wait on their grapes until full and perfect maturity is attained, and then adopting the simplest, which are both the oldest and the best processes, make their grapes into wine, and they will have a product which will come as near perfection as their experience will admit of, and one which will rise to a hight in the world's estimation parallel to the rank held by American meats, breadstuffs and fruits in European markets

Horticultural.

RURALISMS.

FOR a couple of seasons there have been a difference of opinion and some controversy as to the identity of the Champion and Windsor Chief strawberries. At the East the conclusion seems to have been generally reached that they are one and the same. At the West strawberry growers differ, as I learn from the press and private correspondence. Such a veteran grower and observer as Samuel Miller insists that they are distinct, and that we have not got the true Windsor Chief at the East.

To do something toward settling this question I gave them another very careful comparison during the season just past. Learning that Mr. Lovett had the Windsor Chief from "head-quarters," I procured some of the plants, and placed them by the side of the Champion of the same size and age, that they might grow under the same conditions and be handy for close comparison.

Over and over again, and at every stage of growth, I carefully and critically compared the foliage, the flower, the fruit, the yield, and the general habit of the plants; and the conclusion was irresistible that they are identical. The Windsor Chief is said to be a seedling of the Champion. If so, it is an exact reproduction of its parent; and it is singular that both should bear pistillate flowers of the same size and form. My conclusion, of course, is based upon the supposition that I have the true Windsor Chief. Under this view of the case, the Windsor Chief should be withdrawn. Catalogues are already too full.

Is there in reality, as there is in name, a Board of health in New York, and, for that matter, in every city and town in the Union? If so, I would call their attention to the fact, that green, gnarly, worm-eaten apples and pears have already (July 3) appeared in our markets, and the death-rate among children will soon, in consequence, be doubled. I have no words to designate those who send such fruit to market. They are either very thought-

less or very criminal, and in either case the crime of murder lies very close to their doors. I hope no readers of the RURAL are among the number. The duty of all Boards of Health, however, is very plain: they should not only destroy such fruit, but punish severely those who offer it for sale.

As the result of a good deal of observation and some talk with farmers, I am led to the conclusion that the highest state of farming will only be reached through the garden. I have yet to see a farm in a high state of culture where the beginning was not made in the garden. That is where the *a, b, c,* of good farming is to be learned.

I remarked to an old farmer back in the country, whom I had not seen for several years, and whose farm, in the meantime, had improved wonderfully, that his place was so changed I hardly knew it. "Yes," said he, "I've been fixin' up a little. The old woman pestered me to death about the garden, and so I slicked it up a little, and fixed about the house, and it looked so nice I went at the farm fences and the brush, and saved more manure, and kept killing the weeds, and the crops got better, and so I kept going on, and things do look pretty good now. Wife takes a paper, and I take one, and I get time to read it too, and I used to think I hadn't time for anything." And so he ran on, seemingly much pleased with what he had done, and his life and his home without doubt the happier for it. Examples of a like kind may be found all over the country. Papers like the RURAL, therefore, should not lose sight of the garden, with its vegetables, fruits, and flowers.

In some of the leading seed catalogues it is stated that the new Golden Wax bean is eight to ten days earlier than the Black Wax. It struck me that it would be an extraordinary bean that should be ten days earlier than one already noted for its earliness; and I determined to test it carefully. A small plot of ground was prepared, and the soil intermixed so that each kind should be placed under like conditions. The seeds were then put in at precisely the same depth and the same distance apart. The Golden Wax came up one day in advance of the Black Wax, but the latter flowered one day before the Golden Wax, which seemed to equalize things. In the end the Black Wax was fit to pick one day before the Golden Wax. For all useful purposes they may be said to ripen at the same time.

The pod of the Golden Wax is a little longer and broader than the Black Wax, the pod of the latter being round. The color of both is a bright yellow. The Golden Wax, however, has the brighter color when cooked, the reason being that its seeds are nearly white, while those of the Black Wax are black. From the same number of plants, the Black Wax yielded twice the quantity at the first picking, and three times the quantity at the second, and so on to the end, showing the Black Wax to be very much more productive than the Golden. In quality the Golden Wax is perhaps a trifle richer than the Black, but they are both so exceedingly good that this trifling difference may be overlooked. They are of unsurpassed excellence, and a salad of Black Wax beans is a thing not soon forgotten. In small gardens and where only one kind is grown, it should be the Black Wax.

The RURAL for July 10, is a grand number. It would be difficult to overestimate its value to the agricultural and commercial interests of the country. It is a great labor well done. If the Agricultural Department at Washington were only a little more teachable, they might here learn a most valuable lesson. It is another instance of what can be done by intelligent, well-directed private enterprise. I congratulate those who are to be benefited by the labor, as well as those who have so successfully accomplished it.

The RURAL aims to be right always, and is very seldom otherwise; but in "Notes from the Rural Grounds," p. 454, there is a mistake which, in the interest of history, I wish to correct. In the note referred to the reader is left to infer that the Caroline and the New-Rochelle originated with Mr. Carpenter of Rye. You received your Caroline plants from William S. Carpenter of Rye, as I did mine; but the New Rochelle and the Caroline both originated with S. P. Carpenter, of New Rochelle, West Chester Co., N. Y. HORTICOLA.

Remedy for the Rose-Bug on Grape Vines.

THE RURAL, to my inquiry for this, thought the sassafras tree growing near the vines might prove one means of keeping the bugs off. But it is not so in my case, as there are over one hundred young sassafras trees growing within 30 to 200 yards of the grape vines. The bugs attacked these alone. I did not find a single one on cherry, plum, peach, apple, or pear trees, and none on the smaller fruits. I resorted to picking, as I stated, to get rid of the bugs; and after going over the vines three times in the course of a week, it rid me almost entirely of the nuisance. Only a few stray fellows have been seen since, and the grapes are so well grown now that these can do but little harm even if not picked off, but I do not propose to let a single one remain to furnish a new brood hereafter. A. B. ALLEN.

Field Crops.

FORAGE GRASSES.

PROFESSOR W. J. BEAL.

Fowl Meadow Grass or False Red-Top.—Poa serotina.

THE first common name for this grass is so applied, because it was thought to have been brought into Dedham, Mass., by wild fowl. The grass has also been called Duck grass, and Swamp Wire-grass and no doubt by many other names, as every one takes the liberty, and perhaps has a right, to call any grass by any common name he chooses. This is a native grass found mostly on low lands. It flowers about the same time as Timothy. The stems in damp weather branch from the lower joints. The panicle, as will be seen by the cut, is quite long, and slightly drooping when past flower. The cut is two-thirds of the natural size. The spikelets are borne near the ends of the branches. It resembles Poa compressa (Wire grass or Spear grass) in some respects. They flower about the same time, a month after Poa pratensis (June grass). Fowl Meadow grass and Wire grass have dark-green stems which remain green for a long time after the plants have gone to seed. Neither of them spread by root stocks, as is the case with Poa pratensis.

FOWL MEADOW GRASS.—POA SEROTINA—FIG 242.

The stems are very nutritious. Those of Fowl Meadow grass are rather tall and slender and as the top is large and spreading, the grass is quite likely to lodge unless mixed with some others with stouter stems. Owing to the fact that the stems remain green and succulent after flowering, there is not so much need of cutting this grass when in flower as there is of cutting most other grasses at that time. It may be allowed to go to seed before cutting, then thrashed and the straw fed out. In this way it makes a profitable crop, as we get a crop of seeds and a crop of forage. The stems of Orchard grass, June grass or Timothy are of little value to feed after the seeds ripen. The second growth after mowing for hay starts slowly. Like Timothy it is not well adapted for pasture.

On sandy loam, well drained upland, I have seen this grass thrive with Timothy, June grass, Orchard grass, and Red-top. On the extensive marshes near Lansing, Mich., this year it is largely raised on the farm which belonged to the late United States Senator, Zach. Chandler. Where the soil is good, the grass thrives and cuts a good crop of valuable hay—perhaps as good as any other grass would produce. The seeds are small and require more than one year to make strong plants. Pure seeds are not often found in Western markets. They are so difficult to identify that the seedsmen and purchaser are both liable to be misled. This is true of most other grasses, and constitutes one of the many "practical" reasons why farmers should be good botanists.

These papers on grasses, no doubt are "dry," foraging for most readers. I see no way to help it, except to keep talking about the peculiarities of some of the best. It will be some time yet before the average farmer will know that there is much else in the meadow or pasture worth talking about, besides Red clover and Timothy. After a man begins to believe it is for his pecuniary interest to learn about some grasses not familiar to him, he will seek books and papers on the subject.

The Poultry Yard.

GUINEA FOWLS.

ALTHOUGH these birds have been domesticated for very many years, it is singular to notice their peculiar natural waywardness. Every species of domesticated animals shows some peculiar natural traits that domestication has not entirely eradicated. The horse will sometimes dash off at full speed at some imagined danger. The pig, however well fed, will root up a garden or lawn whenever it gets a chance. Poultry will scratch a flower-bed as recklessly as a dunghill. Ducks will ramble along a creek a long way from home, and will even hide and lie quiet when they hear you coming to look for them. Each species of animals seems to be domesticated just up to a certain point, and there stop; their nature will not change beyond that limit. The dog, being endowed with greater intelligence and affection than any other animal, can be admitted to greater familiarity with man than any other; but even he will sometimes break off into his natural weakness for live lambs or other small animals.

Some birds cannot be domesticated at all, others only partially so, as the pheasant, while the Guinea fowl always retains a considerable degree of its natural wildness. Unlike poultry or ducks, it will often change his roosting-place, and frequently shows an unsettled disposition towards night. Some cannot be induced to lay in a house, but ramble off into quiet nooks to hide their eggs; some will do this so effectually that one must watch them very closely to find their nests, as they will not go on the nest while they see you watching them: yet, in its general habits, there is a fearlessness and familiarity that make the Guinea fowl a very amusing pet; some persons have a dislike to their continually repeated note of "come back," or, as some hear it, "buckwheat." For my own part I like to hear it in the farm-yard, its notes are uttered with so much vigor and complacency as to give a cheerful tone to all the surroundings and—what is more singular—it does not appear to annoy other stock. On the other hand, poultry will be on the alert for a note of alarm by the Guineas; it is only a pity they are not as well disposed toward poultry. This is their principal fault — they will harass poultry while feeding or at roosting.

They are gregarious to a great degree, keeping very close together, especially each flock of young ones to the parent bird. Seven that were hatched under a Dominique-Leghorn hen followed her so closely as to almost always surround her, coming quite tamely to the door-step every morning; they stuck to her until they were larger than the hen, and eight months old; the poor hen began to appear tired of her charge, yet so closely was she beset that she could hardly get a chance to have a flirt with Mr. Chanticleer; and while she was hiding in the house to lay they kept guard at and around the door, flying on the roof and otherwise showing uneasiness at her absence. It is generally believed that hawks will not visit a yard to kill chickens where Guinea fowls are kept. That has not been my experience. I never found it so. I have lost quite as many chickens by hawks while I had many Guineas, as I did when I had none, with the same number of chickens in the same yard.

The shells of their eggs are very thick; it is astonishing how the chicks get out of them. When first hatched they are very quick—as lively as partridges—but if reared under a tame hen they become much tamer than when raised by their natural mothers, and they can then be cooped up in wet weather and at nights; but the Guinea mother drags her chicks about through early dews and showers, and often loses them all. When raised by hens they want many changes of food, and all must be good, as turkeys do; but with their natural parent they find much of their food if they have room, for the Guinea hen is a most industrious hunter, and her family are not slow to learn.

There are three distinct varieties as far as color, but nothing more: they are the ordinary pearl, silvery pearl and white, but I know of no difference except that of color. They are late layers, seldom laying before May. The chicks feather and mature quickly, and are fine for the table. HENRY HALES.

HENS EATING EGGS.—Some contend that if egg shells are given to hens it teaches them to eat their eggs. We have made a practice for many years past of feeding all our egg shells to our hens, broken up moderately fine by the hand, and thrown out to them twice or thrice per week. During this time we have never lost an egg by hen eating. In addition to giving our hens the shells, we invariably add any that happen to get broken in picking them up. In them they get the yolk and white, and yet these have not taught them to break a single egg of themselves for the purpose of eating it. In the London Live Stock Journal of June 4th, a correspondent writes that he has followed the practice of giving his egg shells to his hens for 15 years, and not a single one of his flock has been made an egg eater; on the contrary, it was a sure preventive, as the shells gave them all they craved for to assist in forming their eggs.

The Horseman.

REMEDY FOR SHOULDER GALLS.

WHEN team horses that have not had much work during the Winter are taken out and put to plowing in the Spring, it is very difficult to prevent the occurrence of shoulder galls which are often severe enough to disable a team, and always occasion uneasiness to the

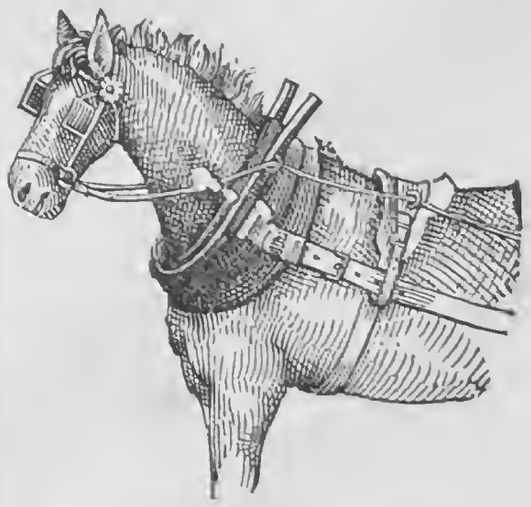

FIG. 243.

animal and prevent his drawing true. I have been troubled in this way every Spring, notwithstanding every pains taken to have well-fitting collars and hames, to wash the shoulders after work and to keep the collars clean and soft. This Spring I have tried a plan that works like a charm, so that galls previously made healed up quickly while the team was at work. This consists of two pieces of smooth calf-skin cut to the form of the collar but larger, and caught by a few stitches on each side, top and bottom, so as to lie smoothly upon the shoulders under the collar. These pieces take all the friction, the collar moving upon the *calf* skin instead of the *horse's* skin, which is relieved from all cause of abrasion.

FIG. 244.

Each piece is cut as in fig. 244: and is fastened into the collar with the flesh side of the leather inside (next the horse). Of course, in cutting from a pattern it must be reversed for the opposite side. It should just come up through the collar so as to show in front, and the free edge should show two inches over the shoulder behind the collar. Figure 243 shows it as applied on the horse.

T. H. H.

The Vineyard.

THE EUMELAN GRAPE.

It occurred to me that the experience of a fruit-grower in the Province of Quebec with regard to this grape, might be of value. The vine came in good order, was planted and treated in the same way as the Concord, and still remains in its place, thick-stemmed, healthy, free from mildew when "Hartfords" beside it are destroyed, and it bears handsome bunches of evenly ripened berries, two weeks before the Concord is eatable. Since fruiting, which was six years ago, it has borne good crops, those of the last three years being particularly heavy. It deserves every good word lavished upon it as regards quality, being so delicate, rich and vinous as to be mistaken for a hot-house grape by those who do not know it well. We have no fault to find with this grape, especially as we tried it the same as the Concord in every respect; but the trouble is, we cannot propagate from it. For years the cuttings had been saved, as are those of our other grapes; the same treatment in every way is given them, and yet we are not successful in raising young vines. This is the only fault we find with the Eumelan, and I write this article in the hope that some one may be able to advise us on that, to us, important subject.

ANNIE L. JACK.

THE EUMELAN GRAPE.—I cannot recommend the Eumelan grape except for its sweetness. It is the sweetest grape which I ever raised and the poorest bearer. For five bearing years my two vines have never borne a cluster, only here and there a bunch of less than half a dozen grapes. We have waited patiently, hoping that when the vines got older they would do better. Last year the little bunches approached the nearest to clusters, and maybe they will continue to grow in size and number until we shall get a reward for our forbearance.

F. D. C.

Pomological.

MINER PLUM.

I SEND you by mail specimens of the Miner plum, which seems to be worthy of some notice. We have only one little tree, with a boll about two and one-half feet high, supporting a symmetrical head some ten feet in diameter, loaded with fruit. The curculio has done his best to cheat us of our share, but these plums come out ahead this year for the third time. Some of them were stung in a dozen places, yet all that ripen are sound and free of worms. As you will notice, the fruit is not exactly No. 1; still it is much to be preferred to nothing. Not only for its fruit is the Miner worthy of cultivation, but for ornament as well. Three times a year (April 1, when crowned with its clusters of white flowers; June 15, when its bright-red, almost scarlet fruit contrasts with the bright-green leaves, and again late in Summer when the foliage has assumed a pleasing tint of purple) it will compare favorably with many shrubs and small trees grown for ornament only. M. B. PRINCE.

Warren Co., N. C.

[The Miner is an improved variety of the Chickasaw plum, of medium size, ovate, juicy, adhering to the stone; excellent for culinary purposes. The plums were received in good order. Thanks.—EDS.]

Miscellaneous.

NOTES FROM MEADOW GLEN FARM.

Summer Management of Sheep.

WE did not turn our sheep out to pasture until the grass was well started, and even then we brought them in at night and fed them grain and hay for at least a week. It would be well if the buyers of wool would be content to throw off less than one-third of the weight of the wool because it is unwashed; then farmers might be less willing to subject their sheep to the worry and fright of washing.

This I consider a risky way of cleansing wool, but if it is necessary a warm day should be selected and care taken not to over-drive the sheep so as to heat them, and they should be handled with care, especially breeding ewes.

When washed, they should be turned on an upland pasture to dry, and I usually allow one week to pass after washing before shearing, to allow the fleece to become yolky. The shearing should be done after all danger of cold and frost is past, and if a storm should come on they should be sheltered from it. The feet of the sheep should be examined, and *if* any signs of foot-rot are seen the diseased part should be cut away and spirits of turpentine applied freely, and in fine-wooled sheep it is often necessary to pare off the hoofs. The lambs should be weaned at the age of three and a half or four months. A good way of doing this is to stable them and feed them cut clover and plenty of water, for then they become tame—a great advantage. The ewes should be put in a dry pasture to dry up their milk, and it might be necessary to draw the milk a few times from the best milkers. After this is done, they should be given the best of pasture to fit them for Winter and mating for another year.

Improvements.

Many farmers are contented to live and leave their farms as they found them, if not in a worse condition. To such I would say:—"Improve your farms; improve your stock by using thoroughbred males; improve the fertility of your soil by using manures, both artificial and home made, and thorough tillage, and improve your fences by renewing the old, tumbled-down things and putting up good ones instead. In some cases it is best to remove the fences altogether and turn several small fields into one, which can be much more conveniently cultivated or mowed. What is more provoking than mowing around fences! Set out trees on your farms, both fruit and ornamental; some one will bless you for it."

This farm contains about 100 acres, and is situated on the south side of the public highway. The buildings are located about in the center east and west. About one quarter of the land, in the southeast corner of the farm, is natural meadow. In the southwest corner is a permanent pasture. When I came into possession of the place the lane leading to the pasture was nearly impassable for man or beast. When I plowed a field or built a wall and found a load of stones, I threw them into the lane, and now it is filled nearly the whole way and makes a permanent road. But the puzzle was where to get the gravel for a covering, as either side was mucky. Now there was a hill on the road near-by, so I conceived the idea of getting the gravel there. Arrangements were made with the road-master; the work has been done at intervals and the road is nearly covered. Over 500 two-horse wagon-loads of culled stones have thus been disposed of instead of being left along the wall or in the way anywhere; the hill, too, has been lowered about two feet, which is a public benefit, while there is now a permanent road leading to the meadow and pasture.

ABEL HOYT.

DRYING AND EVAPORATING FRUIT.

WE have had so many inquiries of late in regard to evaporated fruit—the process, expense and profits of the manufacture—that we are convinced this business, now so imperfectly understood and practiced, will soon, with greater knowledge of its advantage, be recognized as one of the most important industries by fruit growers everywhere. Already its recognition as a legitimate farm industry has made considerable progress and so soon as the fruit-growing public realize the simplicity of the process, the small expense of the necessary appliances and the wide difference between the cost of the evaporated fruit and its actual market value, the business we feel assured will increase very rapidly.

In properly evaporated fruit not only is there no loss in any good quality, but there is an actual development of sugar due to the ripening process, varying from five to twenty-five per cent. The cell structure, flavor and tenderness of the fruit are preserved, and when treated with water, it is easily restored to its former condition, thus solving a problem no less important than the supply of wholesome, nutritious, fresh, ripe fruit—for by this process decay is arrested—for all seasons and all sections.

There are three kinds of fruit driers, two of which are suitable for drying fruit in large quantities, and are usually owned by companies that contract for the surplus product of the neighborhood in which they do business. These machines, however, are unsuitable for small operations as the amount of work to be done would not justify the outlay for motive power to secure the necessary circulation of hot air, and without this they would offer no particular advantage over the old-fashioned drying-house. For a portable machine well fitted for the evaporation of a moderate quantity of fruit we have been very favorably impressed with the merits of the Inclined Flue Pneumatic Evaporator, which has been specially constructed to meet the wants of farmers and orchardists. Various sizes are made with capacities of from five to fifty bushels of fruit per day, and costing from $50 to $200. The cost of fruit evaporated by this device per pound to the producer is claimed to be even less than that of the better grades of sun-dried fruit, when time, labor and quantity are taken into account, and its market value for years has been from 100 to 200 per cent. in favor of the evaporated article. In view of the very promising fruit crops almost everywhere reported, our farming community should investigate this matter closely.

A Novel Bee-house.

On a recent visit to Newburgh I dropped in to see Mr. Clark and his bees, and was greatly pleased with his way of managing the bee business. On the rear of his well-kept grounds is a two-story building used as a tool-shop and bee-house. There is a place for everything. The second story is the bee-house. The hives or boxes are placed close against the sides, which are pierced with holes for the entrance and exit of the bees. They can enter the boxes but not the room. The hives are boxes of his own fashioning, which can be taken away in sections at pleasure. The only thing that looked like an ordinary hive was a box which Mr. Clark uses to drive the bees into while he removes the honey, or secures a queen, or destroys the moth, etc. All this is done in the room. Mr. C. informed me that his bees had not swarmed in five years. But it would take a good many "Jottings" to tell about all the interesting and instructive things I saw in this model bee-house. I saw here, besides, an apple tree grafted with upward of one hundred and thirty varieties of apples, all carefully labeled.

PETER B. MEAD.

WIDE TIRES.—Wide tires are certainly much better than narrow ones, and it seems strange to me why farmers do not demand them and thus cause wagon manufacturers to build their wagon wheels with rims three and a half or four inches wide. Narrow wheels cut up the fields much more than wide ones and, of course, the strain upon the team is much greater. The wheels of ox-carts of the Eastern States are always made with wide tires, and I claim that all farm wagons should have them. What firm will be first to make the change in their wagons from narrow to wide tires.?

F. H. D.

BRIEFLETS.

THUS speaks in an essay (Woman in Horticulture) our respected friend Mr. Samuel B. Parsons: "The true, the well-balanced, the perfect woman is an embodiment of taste and skill and culture, with the addition of those other graces of mind and sentiment and form which influence fathers, husbands and brothers. This influence is potent, and every true man, loving some true woman, delights in nothing so much as the gratification of her wishes." . . . . . Farmer Meehi writes to the London papers under date of July 1st: "In fact, so far the present season is all we could desire and a complete contrast with melancholy 1879. . . . . The Western Rural says that the merits of the Gregg raspberry have never been exaggerated . . . . . A very good method, it seems, for such seedsmen, small-fruit dealers, etc., as are willing to do business in that way, is to "deliver" addresses at horticultural meetings and then, with a request to publish, send copies thereof to the press of the country. The press is very obliging and generally publishes these addresses without charge. . . . . The editorial of the RURAL NEW-YORKER "How to Buy a Horse" is still going the rounds. It has been credited to as many as six different journals. The Independent of last week credits it to the New England Farmer. . . . . The Ohio Farmer says that W. I. Chamberlain carries a solid, practical head on his shoulders, and that his work in the Secretary's office (Ohio State Board of Agriculture) will soon prove it. . . . . Dr. Tanner does not think there is much glory in being considered the fastest man in the world. . . . . Dr. Tanner says that he got so much disgusted that he almost swore that he would never call himself a physician again until he learned something as to the nature of life. He is not satisfied with the system on which our medical education is based. . . . . Again he remarked to a friend: "I have got disgusted with physicians, and particularly with the regular school." If we were not afraid of offending several thousand M. D.'s among our subscribers, we should like to say how much we share Dr. Tanner's feelings. . . . . Mr. Irving D. Cook recommends in the N. Y. Tribune a wet cellar for keeping apples and mentions a forcible test in proof of his recommendations. . . . . Remove suckers from fruit trees. . . . . Pinch out every lateral bud that starts in the axils of the leaves of recently planted grape-vines. One cane alone should be permitted to grow. . . . . La Rochefoucauld said: In love, the old fools are greater fools than the young ones. . . . . Bussy Bohler tells it in a different way: Love like the small-pox, is most dangerous when it comes late. . . . . Beauchene says: Vice alters the countenance of man and quickly destroys the beauty of woman. . . . . If at all, let us have the International Exhibition of 1883 the grandest affair that the world has ever dreamed of. . . . . It is strange that in face of the known fact that there are more cases of real hydrophobia in the Spring—yes, even in Winter—than in Summer, that the regular Summer craze should still run as high as ever. Fits, in 19 cases out of 20, are what give rise to this senseless excitement. . . . . The Miller's committee venture to select the following varieties of wheat as best for milling purposes: Longberry Amber, Lancaster, Indiana Red, Alabama, Orange, Velvet Chaff, Tappahanock and Jennings. They condemn, as they always have, both Clawson and Fultz, the most popular farmers' sorts that are at present known in our country. . . . . W. I. Chamberlain writes us from "On the cars near St. Louis": "I spent a day or two of pleasant travel with B. F. J., of Champaign Co. Ill., who I see is now one of your contributors. . . . . Our respected contemporary, the Evening Post, writes forcibly of the importance of trees in the streets of New York and generally of large cities. "The truth is that all animals, man included, need shade. It should be feasible, too, in towns to promote health, in a direct manner, as well as comfort, by the wise selection and distribution of trees. If this or that species harbors objectionable insects, it can be eschewed; there are plenty to select from without it. The EUCALYPTUS is said to be a safeguard against malaria; and in that case parts of Manhattan which are notoriously infested by malarious disease, might be fringed with this tree to infinite advantage." But our friend, the Evening Post, overlooks an important fact. The first frost would *kill* the EUCALYPTUS. How about the "fringe" then! . . . . . Almanacs would be worth more than three cents apiece if some of the heat of June, July and August was taken off and distributed through the cold months of December, January and February, when it is more needed. These hints are thrown out

gratuitously. We don't suppose they will be acted upon.—Norristown Herald. . . . . New way to "Know all about thyself." Get a Presidential nomination. . . . . Dr. J. A. Lintner has been appointed N. Y. State Entomologist, and the appointment is a good one. . . . . W. I. Chamberlain, our excellent contributor, "without intending to do so," blows the bugle for our contributor, B. F. J., resonantly, in the Country Gentleman. He says "He is regarded by the heavy grain buyers of Chicago as a power—a power, too, honestly, but not unfairly, on the side of the farmer." We do not think Mr. C. could have paid B. F. J. a handsomer compliment.

WHAT OTHERS SAY.

My father purchased an Acme harrow this Spring on the recommendation of the RURAL; it is better than your recommendation said. We lent it to a neighbor to use it on freshly broken Timothy-sod for corn; he says it was worth a dollar an acre to him on his 15 acres. The corn has the best stand in the neighborhood, it being over three feet high on July 1. I think it would be a good machine to use on Western prairie-sod, where the sod is so tough that they have to replow it in the Fall two or three inches deeper than it was "broke" to obtain a soil sufficient to put their crops in. Going over twice with the Acme harrow will pulverize sufficiently for any crop. J. G.
Fremont, Minn.

PROF. SHELDON believes that on almost any land, of whatever kind or quality, it will pay a man to use grain to his cows—that is, the cows will be all the better for a little dry concentrated food along with the bulky succulent grass; they will be the healthier and stronger, and so will give more and richer milk. And the more grain or cake a man uses, within limits, the more cows he may keep, and the richer his land may become year by year. There is, in fact, no better way of improving grass land than by consuming cake upon it. It may be true that nothing is equal to grass of good quality for producing milk; but even of a good thing it is possible to have too much, and a change of food—even a change of pasture—gives, as every intelligent dairy-farmer knows, a fillip which is found in the milk-pail. Try it. Prof. Sheldon says he can recommend it.

AGAIN he says in the Live Stock Journal, from which we quote the above, "I have an Ayrshire cow, a capital milker! Her daily yield of milk is 20 to 24 quarts, and she is increasing in flesh all the time. At the last churning time her 11 days' yield of butter was 22 pounds, an average of two pounds per diem. Pretty good this, as we consider it. But in addition she keeps the family—a small one—in milk and cream. Twice a day she comes to the shed to be milked, and each time receives a couple of pounds or so of decorticated cotton-cake or linseed-cake mixed. The cake costs less than a penny a pound, and as without it she would most probably yield three or four quarts less of milk per day, there would be several pounds less of butter per week, and the cow herself would not be in such good condition."

A REMARKABLE case of animal electricity is given in the current number of the Veterinary Journal. It is reported by Mr. W. Woods, F. R. C. V. S., Wigan, and is as follows:

"On the 21st of February last I was requested to visit a dairyman's cow which had calved the previous night, the owner stating that he did not understand what was the matter with the animal, as every time he touched her a trembling sensation ran up his arm, and he involuntarily twitched it away. He seemed perfectly astounded, and kept impressing it on me that he was not afraid of the cow, but he could not help shaking when he touched her. I visited the cow, and when I placed my hand upon her I received a perfect electrical shock, the animal evidently receiving the same, for as often as she was touched by any one she bellowed, and jumped forward apparently terrified. The pulse and temperature it was perfectly impossible to ascertain. The owner was unable to milk her, as she went almost wild when touched, but was perfectly tranquil when not meddled with, with the exception of a wild look about her eyes. No matter how many times the animal was touched, the same result followed. With great difficulty I administered a strong saline purgative, combined with 15 croton beans, followed in a few hours by a pint of linseed oil, containing 3 ss. chloroform. At night the cow was considerably better, and the following morning I was pleased to find her quite convalescent."

"WE have received a long account of the achievements of 'the Chicken King,' Mr. W. C. Baker, of New Jersey, which we hope to find room for in our next. It is said that Mr. Baker expects to raise 250,000 chickens this year by artificial incubation. He is reported to have spent £16,000 in experiments, and he is now enlarging his yard to accommodate 8,500 laying hens. His gross income is estimated at £16,000 per annum. This is poultry farming indeed." We copy the above from the London Live Stock Journal. We believe that Mr. Baker's success must be better known abroad than at home.

GEN. DIVEN, in the course of his recent address before the Farmer's Club, asks: "Did it ever occur to you, my fellow farmers, that you of all men have the deepest interest in the prosperity of this country, and in the government and laws that are to contribute to such prosperity? This is your country, not only in the sense in which it is the country of every citizen, but it is your country because you own it in *fee simple*, that is, absolute ownership of the soil?

THE editor of the Mark Lane Express thus refers to an article on in-and-in breeding, by Mr. Mathews. He has shown very conclusively the loss of fecundity which has attended the system of in-and-in or "line" breeding, in the case of the Duchess tribe of Short-horns, and pointed out very forcibly that in-and-in breeding, when practised in the later stages of the development of a breed of animals, is essentially a different thing from the close interbreeding which is necessary to form a distinct breed. In the one case the ancestors of the animals are closely related, whereas in the other there is no consanguinity in the material to be operated upon. Mr. Mathews's carefully arranged facts will speak for themselves, and we take them to be a strong confirmation of the opinion so frequently expressed in this column to the effect that the breeding of "fancy" Short-horns has resulted in injury rather than benefit to the stock of the country. Fanciers have bred their Short-horns for pedigrees of theoretical purity; and these they have obtained at the expense of fertility, constitution and corporeal excellence in the animals themselves. The "fancy" has had its day, and the mania has almost died out; fictitious values are very nearly at an end, and the "bottom of the Short-horn humbug" has fairly "dropped out." So much the better. Those who breed Short-horns to sell to farmers will henceforth have to study the improvement of the animals, not merely the concentration of blood; and in a few years' time we hope to see all that is good in the various tribes and families of Short-horns united by "mixing sorts" into one sort—and that sort a good one.

"THERE is another point," said Pres. Hayes in his speech to the Alumni of Yale College, "to which I wish to allude, and yet it is not a point, for it has length and breadth and depth and thickness. There is an old saying, "you may lead a horse to water, but you cannot make him drink." Knowing the character of the American people, and knowing that they desire as their representatives men of the highest moral as well as mental character, I looked about long to find a man who could suitably represent our nation at the court of our great sister nation, England. Again in my emergency I turned to Yale, and found just the man. I reversed the old adage in this case, for I brought the water to the horse, but President Porter wouldn't drink. [Long-continued applause and cheers.] And he was altogether right in refusing to accept the position tendered him. Any administration and any country is more indebted to the man who is engaged in educating the people, than it is to those who are its executive and administrative officers. The executive officer is but the figure-head at best. The government are the men who, figuratively speaking, run the engine and boilers of the government. The head of such an institution as this, where moral and intellectual culture are combined, is the man who forms men who control not only the figure-head but control the nation. I wish here publicly to return thanks to the man who had the judgment to give such an example to the nation. [Applause.] Whether Yale's sons guide or act as figure-heads of the nation, I know they will be an honor to you. Any administration that is a good one, or desires to be a good one, must ever be grateful to such an institution as this." [Long-continued applause.] We take the above from the Inter-Ocean's report.

WE copy the following from the London Live Stock Journal. "Good grass land is a good property. Like the lilies of the field, it may be said to toil not; like Mrs. Stowe's Topsy, it simply "grows" without extraneous help, and throws up a perennial source of food for stock. It is more productive, and, at the same time, less costly than arable land; it is subject to fewer casualities, and requires a smaller amount of direct supervision. One acre of really good grass land will produce 280 pounds of beef or mutton during the course of the Summer, if grazed. If under dairy-cows, it will yield 400 gallons of milk, 168 pounds of butter, or 400 pounds of cheese, as the case may be. If mown, it may be expected to yield in hay and aftermath an equivalent to two tons of prime hay. The produce will be seen, on calculating out the result, to be worth from £10 to £12 per acre, without the outlay necessary to obtain crops of similar value from arable land. Good indeed must tillage land be which will year by year, give such a result. The two cases may appear to have been put very favorably for the grass land, but we feel confident that when we are dealing with really good grass, the profits are larger than can be looked for in the case of any arable land; chiefly because the landlord and tenant are enabled to divide such profits without the intervention of laborers, manure merchants, and implement makers.

"I BELIEVE," Dr. Tanner, the fasting man, said to a friend, "that many persons are buried alive. We have had a couple of instances of mistakes in regard to the presence of death lately. Only a short time ago a child was discovered to be alive while it was lying on a slab in the New York Morgue. Once I wrote a letter to a newspaper on the subject, and afterward a reporter in St. Louis interviewed the person who had charge of the removal of all the bodies in one of the city cemeteries. He learned from this person that there were evidences that in this one cemetery fifty persons had been buried alive. Only the annals of eternity can tell us how many persons have recovered after they have been supposed to be dead. I am opposed to forcing people to eat when they don't want to. I want to show that it is safe to go without food. Once physicians were committed to the doctrine of depletion. They starved patients and let their blood. Now they are at the opposite extreme. If a patient's stomach is not fitted to receive food they force it down. The cry is, 'Give lots of nourishment.' "I believe," he said further, "that a human being can hibernate just as well as a bear. Almost any animal can hibernate. Up in Jo Daviess County in Illinois hogs were forced to hibernate one Winter. The snow fell so fast and so deep that they were buried. In the Spring they came out alive and fat. It is a mistake to suppose that bears are lean when they come out in the Spring. The Indians know better. They think that a bear shot just after he leaves his place of hibernation in the Spring, is a great prize. The truth about this matter is that his fat is of such a nature after his hibernation that it disappears in a few days, owing to some chemical change that I do not understand. I myself have caught opossums late in the Spring in their places of hibernation, and I have found them fat."

OUR contributor, Prof. I. P. Sheldon, thus writes to the London Live Stock Journal:

We are decidedly in favor of legislative action being taken in this country to demand that all artificial butter shall be sold, whether by wholesale or retail, under a designation that is not misleading. There is at present a larger quantity of this nefarious stuff on our markets than the public are aware of, and too many retail customers get hold of it under a fond delusion that they have a bit of butter straight from the dairy. It is, of course, only the retailers who have the chance of palming off this doubtful compound for genuine butter; they, as buyers, are not imposed on by the manufacturers. A great deal of the melted intestinal and other animal fat which is used in the manufacture of butterine is sent over from America to Holland in an unfinished state, and our Dutch friends finish it off for us. To Hamburg, Bremen, and other German ports it is also sent, after which it comes to us having the form of butter. About 3,000,000 lbs. per annum are thus exported from the United States. There are, however, butterine manufactories in our own country, in the neighborhood of London, and Canon Bagot tells us of a large factory in his own neighborhood, in County Kildare. It is a growing industry, this artificial butter making. The profits on it are too good to be easily relinquished. Much of the waste fat which has previously gone for soap making is now turned into butter, and sells for twice or thrice as much a pound, the public swallowing that which was previously used for purposes of outward cleanliness. Yet it is not true that Thames mud is turned into butter—the process would be too expensive.

SOME of this butterine is a clever imitation of the real thing, and in certain cases an expert would be required to detect it. But the greatest danger does not lie in the cleverness of the imitation; the closer the copy, in fact, we may assume the better article the counterfeit will be. The well-made, cleverly-imitated article, is presumably produced from materials to which, in themselves, no exception can be taken; they must, in the first place, be the best of their kind, clean and wholesome, and they are manipulated by clean and thorough processes, and with the most approved machinery and utensils. Butterine of this grade we have now and again seen, and we rather like it for what it is. But there is a great deal of execrable stuff on the market. Not all the fat of animals is healthy food; diseases kill many of them, and others are slaughtered "to save their lives;" in some of them exist parasitic diseases, which are easily transmitted in the process of consumption; and it is asserted that the mode of making butterine is not such as will destroy these parasites, supposing them to exist in the fat of which the butterine is made.

FOR some time past, the American press, and through it the American dairy farmers, have been greatly exercised on account of oleomargarine—artificial butter, or butterine, as it is variously termed—and they have at length lashed themselves into a fury about it. It is ruining the dairy interest, they say, by being sold under no designation and with no brand which declares its real character. Being essentially an artificial and an imitative thing, every device is used to make it counterfeit real butter as closely as possible, and while the law permits the sale of it under any name which the retailer may think fit to employ, it is clear that the public will be the chief sufferers by the swindle, while the dairymen of the country are having their trade sadly curtailed and slandered. Such are a few of the milder ideas prevailing on the other side of the Atlantic with regard to "Brummagen" butter. It is satisfactory to see that bills are being introduced into the State Legislatures to compel the sale of this spurious article under a fitting name—every cask of it being so branded in large letters, and every customer being made aware of what he is buying.

Everywhere.

RURAL SPECIAL REPORTS.

ARK., Greenwood, Sebastian Co.—Farmers are jubilant. The crops are magnificent, finer even than last year. The corn crop is safe. The cotton stand is splendid. Fruit is abundant, and all other crops turn out well. Happy Arkansas! Peace and prosperity reign, and immigration is pouring in at an increased ratio. Verily, Western Arkansas has a glorious future before it. My Blount corn, planted March 30th, is nearly matured and a success. The RURAL seeds thrive well here, especially the Telephone Peas, Mold's Ennobled oats, Golden Ovoid mangels, and the Southern cow-pea. R. R.

CAL., El Dorado, Eldorado Co.—The wheat harvest will be about 70 per cent. of a full crop. North winds have materially decreased the yield; some damage has resulted from other causes, but not to a great extent. The corn harvest can hardly be stated as yet; but a full crop is expected. Oats, rye and barley are giving in most localities full crops. In some sections the crop will be short but not to an extent great enough to reduce the yield as a whole. Sorghum is grown in very limited quantities; in fact, in this section it is being experimented with this season for the first time. In fruit, the apple, pear, cherry and quince will yield full crops; peaches about three-eighths of a crop (curl leaf very bad); plums, about three-quarters of a crop. Small fruits will be full crops and never better fruit grown. This is the best crop of cherries we have had for many years. W. C. L. D.

CAL., Los Angeles, Los Angeles Co.—The harvest in this county will be one of our best for many years: 100,000 acres in wheat will yield 900,000 centals, and will bring in over $1,000,000 new money, establishing the fact that southern California is a wheat-growing country. The last of the orange crop has just been sold, and our ten-year-old orchards yield a *net* profit per acre of $500. Last year's grape crop netted to the raisin maker from three-year-old vines $70 per acre, and from five-year-old vines as high as $140 per acre. Grapes for wine making are giving a net return of $35 to $60 per acre. Our Northern fruit crop looks exceedingly fine and the yield will be good, prices high, and the demand far more than can be possibly delivered in the market. Our climate is as fine as ever and hundreds of invalids from various sections of the world come here and regain their health. G. R.

CAL., San Juan, San Benito Co.—Wheat, corn, oats and barley are much above the average hereabouts. No rye or sorghum. Peaches are scarce; pears below the average; other fruits good. Late apples are the most profitable. Plums are very prolific, but yield too much for our market. Cherries were extra-fine this year. The varieties of wheat are mainly Australian, Sonora and Propo. The remainder of the county will have about one-third less of wheat than expected on account of hot weather. The hay crop is immense. Comparative acreage—wheat, one-half; barley, 3-16; oats, 3-16; corn, 1-16; potatoes, 1-16. Much less land in beans this year than usual.
J. B. H.

CANADA, Ont., Glenmorris, July 8.—Farmers are busy hay-making. The past week has been very wet, and has delayed the haying considerably, so that the Fall wheat will be ready to cut before the hay can be gathered in. Fall wheat will be above an average crop and considerably earlier than usual, some having been cut the last of June. All kinds of Spring crops look well. Fruit will be a fair crop. I am trying a few hills of Blount's Prolific corn, and it is doing finely so far, and also a few

hills of China corn. I planted one peck of the Beauty of Hebron potato for a trial. R. R.

CONN., Greenwich, Fairfield Co., July 12.—Wheat and rye have been harvested in good condition. The former is very good; the kernel is plump, but the head is not extra-long; the acreage is about seven times as large as usual. Rye is very poor in the kernel, but the straw is extra-heavy; the acreage is large. Barley is not raised to any extent. Oats are not a good crop this year; the grain will be very light. Corn never looked better at this season of the year. An old farmer, 79 years old, one who has always lived in this town, says he never saw corn as forward as it is this year, nor has he seen as dry a season as the past Spring since 1824. Potatoes have looked very well all the season, but I hardly think we shall have any crop, unless it may be some pieces planted extra-late. The hay crop with some has been very light indeed; others say they have never had more hay on the same number of acres than they had last year. Hay will go a good way this Winter on account of the quality being so good. Many farmers have made and are making provisions for the deficient hay crop by planting late corn for fodder to be cut and cured, ears and stalks. Hay is at this writing bringing $25 per ton; oats, 45c. per bushel; corn 57c., and corn meal, $21 per ton. Small fruits were in abundance at their season. Blackberries are very promising, but everything is in want of rain. Wells and springs are very low; brooks are all dry and have been for two months. Apples look very well indeed, yet the crop will not be large. Pears are the poorest crop I ever saw in this place. Onions are not raised much here, yet further east, towards Bridgeport, they are a special crop and are drying up and are nearly a failure. We have had some showers of late, but it will take a great quantity of rain to fill the ground with water. Milk is selling for three cents per quart, and butter from 20 to 30 cents per pound. Cows and other stock are very cheap. Some farmers are selling their fat cattle for just what they had offered for them in the Spring per head. The Army worm did very little damage here. S. J. C.

CONN., Danbury, Fairfield Co., July 19th.—Oats a fair crop; straw short. No barley raised. Wheat all harvested; a good crop. Corn looks well; acreage small, about the same as in former years—eight-rowed yellow, mostly. Potatoes, usual acreage; will be light owing to drought and bugs—Early and Late Rose, Beauty of Hebron, and seedlings of different varieties. Cherries a good crop; strawberries, blackberries and raspberries heavy crops, but fruit small owing to dry weather. Hay, hardly half a crop, but heavy and good what there is of it. Of sorghum none is raised. Apples a very good crop, but falling from high wind. R. I. Greening, Northern Spy, Roxbury Russet are the leading varieties. Grapes in abundance. E. W. B.

DAKOTA T'Y., Rockport, Hanson Co.—The crops of wheat, oats and barley grown in this locality promise very well, and will average as well as any I have ever seen grown in Canada, Michigan, or Wisconsin. Potatoes and corn are choice. Amber cane is the only variety planted here, and promises well. Wheat and oats are the principal crops growing in this neighborhood—two-thirds wheat and one-third oats is about the ratio in general. This is the first general harvest gathered in this county; hence we have no fruit, as few settlers were in this section previous to 1878. When the proper time elapses I hope to be able to report on fruits. I am growing 28 acres of wheat, 27 of oats, four of corn, three of barley and three of potatoes on last year's breaking. On new breaking I have 50 acres of seed-corn, nine of beans, three of Amber cane, and one of melons. J. & Mc'M.

DAKOTA, Deadwood, Lawrence Co.—Since May 15, the rains have made the crops look good. A very large acreage of wheat, oats and corn, has been sown; all look well. The same can be said of vegetables of all kinds. Sorghum has been raised here, but while present prices prevail it will not receive much attention, as other crops pay so much better. Fruit is being tried, and from what I can learn, it will be a success. A few people are trying apples, cherries, plums, peaches, pears, blackberries, and strawberries, and grapes, and it is believed that all but apple, peach and pear will do splendidly. Hay this season is going to be light for want of early rains. H. A. R.

FLORIDA, Waldo, Alachan Co.—Wheat is not grown here. Cotton will be a good crop, better than it has been for years; potatoes (sweet) will also be a good crop. Oats this year have been almost a failure. Barley is not grown here. Fruits are not grown to any extent. This year the peaches are a failure; oranges look promising, and there will be a good yield. Tobacco, both Cuba and Connecticut Seed Leaf, is being grown here, and both do well; the same may be said of sugar cane. W. B.

GA., Sheltonville, Forsyth Co.—Wheat in this section is almost an entire failure, owing to the rust and fly; some farmers are not cutting any at all, and what is cut will not average more than one-fifth of a crop. The fall oats rusted badly, and will not do for seed. Rust-proof oats are tolerably good, they were injured very little by rust, and will make the average yield about a half crop. Corn and cotton are looking well now, but it is too soon to make any estimate as to the probable yield, as a drought in July or August would injure the crops so much. Farmers hereabouts are just now finishing laying by, and crops are all in good growing condition. The peach crop is a failure but we shall have about half a crop of apples. E. R. R.

IDAHO, Grangeville, Idaho Co., July 9.—Fall grain was partially winter-killed—late Spring, late grain. Early sown grain looks well; late sown is beginning to suffer for rain. Weather hot and dry. Club wheat is the only variety here. Imperial and Egyptian and some Hopkins oats are grown here, and have the largest acreage; wheat comes next and barley last; this is grown for hog feed. Early Rose, Pink Eyes, Mechanic and one or two other varieties constitute the potato crop, which is very good. No sorghum here. Apples are the only fruit grown here at present, and there is a very good prospect for a crop. This is a new country; few orchards, but any fruit would grow here, except peaches. Timothy is not good this year. A. C.

IDAHO, Squam Creek, Bois Co., July 10.—Wheat will yield from 25 to 30 bushels per acre—not as good as last year owing to its having been too cold and wet in Spring. No corn is grown here except sweet, and that is good. So are potatoes. Oats are a fine crop—40 to 50 bushels per acre. Barley is the main crop here and averages from 40 to 60 bushels to the acre. We raise chiefly Australian wheat; Evergreen sweet corn; Mechanic, Early Rose and Peerless potatoes; small white oats; black and Egyptian rye; six-rowed barley. Sorghum sugar cane does well, but only a little is grown. The prospect for fruit was never better. Several kinds of apples, peaches and plums thrive here. We are plagued by neither borers nor worms. W. S.

IOWA, Dakota, Humboldt Co.—The prospects for big crops were never better than at the present time. Rye is a fair crop and mostly harveated, but the acreage is small. Barley is a good yield, but not much is raised here. Wheat and oats are the grains mostly grown here; the acreage is about one-third more than last year and mostly sowed on last year's breaking. Oats do better on old land; on new land we get the most and best wheat. There is more breaking done this year than for any three years before, which will be mostly put into wheat next Spring. The corn crop looks better than it ever did, so the old settlers tell me—about one-fourth more planted than last year. Potatoes are a good crop, but there is not a large amount planted on account of the bugs, which have been very bad till this year. We do not raise much Timothy and clover here on account of having so much prairie grass for fodder, which is claimed to be better to feed. Fruit is more of an experiment than anything else; but we are getting into it now and hope to be able to raise enough for our own use soon. We shall get the largest yield of wheat that ever was raised in these parts, if it does not get scalded by the sun. The trouble is that after showers the hot sun bakes the grain when it is in the dough. G. L. H.

KANSAS, Meadow Brook, Johnson Co.—We commenced harvesting wheat on the 9th. The yield is a good average; over 20 bushels per acre. May, Fultz, Walker and Clawson are the principal sorts grown here. The May is from eight to ten days earlier than the other varieties, and on rich ground gives the best yield. The other kinds, too, are more liable to be winter-killed. The acreage was 50 per cent. over that of last year. In quality and color wheat is very fine. Corn, where well cultivated, looks very fine; area not as large as last year. Flax is good, and has a large acreage. Oats are fair, but not much grown. Potatoes look fine, what little there is of them. Not enough sorghum is raised for home use; some sugar will be made from it this year. Meadows will not give more than two-thirds of a crop. Fruit of all kinds is plentiful; apples being the best crop I have seen here in 10 years; Early Harvest is now ripe. We had some showers in April; windy and unpleasant weather in May; a dry June, and plenty of heavy rain in July. H. S.

KANSAS, Logan, Phillips Co.—The drought which has been troubling this section has been broken and good rains have lately rejoiced the land. They came too late, however, to save our crops, and quite a large number of settlers have left this place, and those who remain are very destitute and must suffer severely unless helped. A drive of three hours to the southeast, however, would bring one into a region where the crops are fair, so that the drought has here only affected a comparatively narrow belt. We may get some late corn, as some of us are still planting. J. D. S.

KY., Cynthiana, Harrison Co., July 15.—Wheat is pretty well thrashed and secured at this date and is a light yield per acre, averaging about 10 bushels; a greater acreage than ever before was harvested in the Blue-grass region, wheat being our main crop this year. Of rye almost none was harvested; what little was sown was pastured until 1st of June; then plowed and planted with corn. Barley is a fair crop—not much sowed. Corn is a fair average and never looked more promising. It has been much neglected during the heavy wheat harvest and would be sadly injured by a little drought in the latter part of July and August. Potatoes, both sweet and Irish, are very fine. It is questionable which is the more profitable to raise with us, and it is certain that neither, as a crop for profit, is properly appreciated by our people. In our long seasons either may be made one of a double crop. Last year I raised 60 bushels of corn to the acre by drilling it in between my potato rows after they were fairly made. Sweet potatoes may be planted after a crop of barley or even wheat is taken from the ground. The prospect for fruit was never better in Central Kentucky than this year. Apples are a fine crop; they commenced ripening 1st of June. Peaches are about half a crop and commenced ripening at the middle of June and will last until November. Strawberries were an abundant crop; commenced ripening May 4th, and continued until 1st of July. Grapes are an abundant crop and never promised better. They commence ripening here about 25th of July, and hang on the vines until middle of December. We raise both figs and persimmons and a fair crop of almost anything that requires but little work or attention. No tobacco is grown in the Blue-grass region. Kentucky is the finest country in the world for pleasant homes, and the only country where a man can farm successfully on horseback. J. A. M.

LA., New Iberia, July 12.—Of wheat, oats, rye and barley we raise none, and of fruit very little. Sugar-cane and cotton take up all our care and labor. The cane crop was very promising, but has suffered during the last few weeks, and is not laid by in as good order as usual. Cotton is very fine, but every one expects the worm. The corn crop is splendid. A. E. G.

LA., Plaquemine Brulee, St. Landry Parish, July 10.—The crops in general are uncommonly good, corn especially. No fruit is grown here, except peaches and they were killed by frost or cold winds. W. W. C.

MINN. Stewart, Mc. Leod Co.,—The prospects of wheat, oats and barley are very promising. But little rye is raised here. Corn was lately considerably damaged by hail stones measuring seven inches in circumference. The Fife wheat alone is grown here. Our oats are the Norway White and common black. The acreage of wheat increases every year; that of oats and barley is about the same as last year. Sorghum is grown to a large extent, mostly the Early Amber. No fruit to speak of—damaged by hail and heavy rains. Hyslop and Transcendent crabs have proven the most successful. Potatoes will be an average yield. No. 2 wheat is worth 90c; oats, 20 to 30c; eggs, 10c; butter 10 to 15c; wool 18 to 23c. J. C.

MO., Wheatland, Hickory Co.—Wheat harvest over; acreage above an average—say 15 per cent. The yield will be large, probably 25 to 30 per cent. over the average of all years. Many farmers have thrashed, and the yield is from 18 to 25 bushels per acre; quality excellent. Corn never looked better; the acreage is about an average, and the prospect for a yield above an average, is quite flattering. Many fields are tasselling and some in "roasting ears." Potatoes are but little raised here, but what are planted are good—probably as great in quantity and fine in quality as we ever find in Southwestern Missouri. Oats are above an average yield, but late rains have damaged the crop. No rye or barley is raised. The kinds of wheat raised here are: Red Sea, Fultz, May, Walker and Gipsey. Of corn, the large yellow and large white are the principal varieties. Potatoes principally are Early Rose, Buckeye, Russet and Peachblow. The fruit prospect is excellent; peaches, pears, plums, apples, and, in fact, large and small fruits, are loaded. Fruits of all kinds are naturally at home here; failures are scarcely ever known. The principal apples are Janet, Winesap, Ben Davis, Red Astrachan, Rambo, Red June, Early Harvest, Bellflower. E. P.

MONTANA T., Gallatin Valley, Gallatin Co., July 10.—We had a wet, backward Spring. Wheat, oats and barley do well here; wheat yields from 25 to 60 bushels per acre; oats 40 to 100; barley 40 to 75; potatoes from 300 to 600. The valley alone is farmed—a small portion of the Territory. This is no corn country. But little fruit is raised. This is one of the best grazing countries. Mining is the only business in the mountains. We have had a large immigration this year. C. H. W.

NEW JERSEY, Roselle, Union Co.—I send you herewith some specimens of hollyhocks raised from the seed furnished by "Rural Free Seed Distribution." I think they are lovely. I am sorry I did not think to send some before, as I have had larger and handsomer ones than I have now, but a shower of yesterday has injured them. I wish you could see the spikes of the dark purple ones; they are a dense mass of bloom. Considering the drought, I think they have done wonderfully, and I am much pleased. I have had some of the salmon-pink more double than the one I send, and think they are the handsomest hollyhocks I ever saw. I was not very successful with the seed furnished last year. I planted it out-of-doors in May just before the dry, hot spell we had, and then left for a visit East. I had nothing from them, except the hollyhocks. This year I have 12 nice roots of aquilegia and five of double hibiscus. I planted double pentstemons and a part of the iris in boxes in the house, but not a seed came up. The rest I have given to a friend who has a greenhouse; he said he would try and start them for me and then give me roots. Two years ago we had some cuttings from you of a willow—Salix pentandra. Two of them rooted well; one we gave to a neighbor: the other is growing finely, and gives promise of being a beautiful tree. L. A. R.

[The box of hollyhocks was received. They are, indeed, beautiful. One is nearly black, another a dark maroon, two bright red, one white, one a flesh color or pinkish-salmon. The seeds of the hybrid pentstemons and irises are really so valuable that we are disappointed whenever we hear of failure in their germination. They are all of them seeds of last year's growth—we guarantee it—and any failure is owing to too much, too little or to improper care.—EDS.]

N. Y., Nunda, Livingston Co., July 11.—Our crops are good except hay. Wheat was never better. Corn and potatoes promise well, but need rain. J. M.

N. C., Greensboro, Guilford Co.—Wheat is all harvested and is thrashing out not very good on account of rust. Winter oats are good; spring oats very poor. Corn is looking well. But little rye or barley is grown here. Potatoes are good but are only grown for family use. The acreage of wheat is above the average; so is that of Spring oats. The fruit crop is mostly a failure; yet there are some peaches of rather poor quality. Apples are scarce but not good. Pears promise a tolerable crop but not many are grown for market — trees small and not half enough planted. O. C. A.

OHIO, Liberty Center, Henry Co.—The wheat harvest is mostly done, commencing about June 20th, with a larger acreage than ever before, and a good growth; but hot, showery weather caused it to ripen too rapidly to produce the most favorable results. The crop is already being thrashed from the shock. Corn has a mammoth growth, and is very forward, early pieces standing eight to 10 feet high, and in silk. I never saw a better prospect for this crop. Oats are heavy and somewhat lodged by the frequent showers; they grow here too rapidly and large to stand in moist seasons like the present, so that the number of bushels and weight of the grain are reduced. Hay is a fair crop; some heavy fields of Timothy are about half secured. The potato bug commenced its ravages early and in great force, everybody predicting a general destruction of the potato crop; but owing to the frequent rains all Summer (or for other reasons) the pests have disappeared, and the potato growth is very thrifty at present; we are promised an abundant yield. Very little rye or barley is grown in this part of the State. A new kind of sorghum called the Early Amber has taken precedence over other kinds in this neighborhood, and looks splendid, as far as heard from. Sorghum raising is on the increase in this section; some specimens of sugar were produced from sorghum here last season. The apple crop is promising, but will not be over an average crop. R. I. Greening, Baldwin, Tompkins County King and Russet are generally full and fair. The early varieties are falling badly (especially the Sweet Boughs) owing to an insect or worm that bores the fruit to the core. The new shoots of limbs on most orchards have been more or less affected and died to quite a large extent from parasites living on the sap between the outer bark and wood. The pear trees are blighting considerably, we think, from the same cause, and it is feared that the pear crop in this section is destined to become extinct. The common red and black tame cherry produced a large and excellent crop. The cabbage-worm also comes in the catalogue of pests, and all kinds of experiments are tried, and generally with very limited success. One man tells me that, to kill the worms, through his desperation, expecting to kill the cabbage also, he took strong, unleached wood ashes from his stove and literally covered his cabbage with it, using a stove-shovel full to each plant after they had begun to head, throwing the ashes on top, so that the rains and dews would cause the lye to penetrate every crevice between the leaves. To his astonishment his cabbage beat any he had ever before raised, the ashes having effectually destroyed every

worm, and the plant having been largely invigorated by the application. This is a cheap and easy remedy, and I give it second-hand for what it is worth, as I have just tried it myself and also used the same dose on some cucumber vines that are struck with the blight, throwing the ashes to the roots of the vines now in full bearing. This was done about three days ago, and the blight has stopped. I shall give it a thorough trial, and will report again the results. C. C.

OHIO, Camden, Preble Co., July 19.—We are having a fine rain to-day after a dry month which was fine for securing our harvest. Thrashing-machine men tell me that wheat averages about 15 bushels per acre. Hay is light. Oats were injured by rust and did not fill up well. Flax appears good; none thrashed yet; cannot say how it will yield. W. M.

OHIO, Mulberry Corners, Geauga Co.—I received ten cuttings of Salix pentandra; set them March 24 in a rather damp location and a rich soil. To-day seven are over three feet high; two are 15 inches and one is dead. The nine look well; leaves, a rich dark green, and from four to five inches long, shining above, and edges serrate; very handsome. H. B.

OREGON, Tangent, Linn Co.—The prospect for the wheat crop is good, about an average for both Fall and Spring sowing. The varieties for Winter are Golden Chaff, Clawson and White Winter. For Spring sowing we use Club, White Chili and Sonora. Not enough corn is grown to be of any consequence. Of potatoes and oats we have plenty for home use. Rye is not raised here. There is enough barley for local brewers. Sorghum is on trial. Fruit crops are about an average. Apples: Moumouth or Red Cheek Pippin. All plums do well. Cherries and all of the small fruit thrive here. R. T. S.

OREGON, Willsboro, Washington Co., July 10.—Corn, rye, barley are raised here only in small quantities. Wheat will be 25 per cent better than last year. Oats will be over an average. The acreage of wheat, oats and potatoes is 10 per cent. increase over last year, and the prospects for these crops and fruit are excellent. A fine rain is now falling. This is for Washington county. No sorghum. T. W. T.

PA., Hornbrook, Bradford Co., July 13th.—I have just finished the wheat harvest; crop good, but straw so short I could not bind it. Oats an average crop and about ready to harvest here on the river. I planted one acre to Blount's White Prolific corn; it is now six feet tall. Corn is looking well and bids fair for a good crop. About the same amount was planted as last year. Potatoes are looking fine, and promise a good crop. My Beauty of Hebron potatoes are very fine. I am digging them for market now. They are ten days earlier than the Early Rose, planted at the same time and treated in the same way. The cow-peas sent by the RURAL are looking fine; they look more like beans than peas. Grass is a short crop, owing to the dry weather in the latter part of May and first part of June. Pasturage is now good and cows are doing better. Butter is profitable here; buyers are paying 20c. at the present time for good fresh tub. The fruit crop is short, but not a total failure. I shall have apples, peaches, grapes, etc., for my own use. Strawberries are a short crop. The Wilson's Albany takes the lead here. The Black Caps are a good crop. Doolittle takes the lead. Strawberries sold from 10 to 20c. per quart; Black Caps from eight to 12c. per quart. J. T.

PENN., Mt. Jackson, Lawrence Co., July 13.—The weather has been wet for three weeks. We have a good wheat crop. Oats also are fine. Of barley and rye not much is grown. No sorghum is raised here. We do not expect over one-third of a crop of fruit. Of apples the best varieties here are Peck's Pleasant, Northern Spy, R. I. Greening, English Rambo, Russet, Baldwin. R. J. P.

TEXAS, Caldwell, Burleson Co., July 13th.—Wheat is always a small crop here. Only about one in ten sow any; variety, the Nicaragua. There is a little experimenting with other bearded kinds, with poor success, however. Yield about 10 bushels per acre. Crop good this year. Corn is simply magnificent for 30 miles around here—White Shoe-peg, Gourd-seed, Flint, in limited quantities, yellow, ditto. A great deal is grown of a variety of Gourd-seed called Strawberry. The White Shoe-peg and Gourd-seed are the favorites; all produce about equally well. Upland in this county will yield 25 bushels; creek and river bottoms, 75 bushels on the average. Exceptional uplands will yield 40 bushels, and bottoms, 100. Two-fifths of the arable land in the county are in corn. So far our cotton is doing better than it has before in this county in ten years; just enough rain; just enough sun; just enough work, and the plant is perfectly healthy. A little over half of our cultivated land is in cotton. Improved Shnpoch takes the lead, occupying seven-eighths of the land devoted to cotton, Dixon occupies one-sixteenth; the balance is taken up with experimental kinds just being introduced. Picking will commence about July 20th regularly. Cotton is now opening. Nearly everybody has laid by his cotton. Corn was laid by three weeks ago. The yield of cotton will depend on what may turn up in the next two months. The principal foes of the crop are drought and worms. However, but little rain is needed from this on. Too much rain after this, starts top growth and invites the worm. The pest is 40 miles below here now in small numbers. If no accident befalls the crop, experts say the county will average over three-quarters of a bale to the acre. Potatoes, Irish, only just a few are grown for the table use for three or four weeks—Early Rose and Goodrich; both are well liked and yield, I think, at the rate of about 350 bushels per acre. (!) The crop was all made one month ago. We buy all our seed North. Sweet potatoes! Now the children are all attention. We could not do without them. They are food, medicine and sweetmeat all in one. The best is a small, deep-yellow yam weighing half a pound; next the Brazilian yam, one pound in weight; then the Cuba yam, the largest and coarsest of all, weighing three to six pounds—average yield 175 bushels per acre. The Cuba yam is very early. Oats are perfectly at home in this part of Texas; perhaps about one-twentieth of the cultivated land in the county is in oats. The crop is increasing in importance each year. They are sown almost entirely on upland. In this county they were injured a little by chinch bugs this year; otherwise they are very good—average yield, over 60 bushels; it has been in past years as high as 75 bushels; kinds, Red Rust-proof, almost entirely with a few of the little black which have partly failed in some localities. Rye and barley are as well suited to this place as oats; but for some reason there are scarcely 50 acres of each in the county. The prospects for fruit were never worse. The warm spells in Winter followed by sudden "northers," seem to have weakened the vitality of the trees, especially of pears. There is no crop of these or of apples, cherries or quinces, and only a very few peaches, nectarines and cultivated plums. Wild plums are in abundance. All peaches do well in a favorable season, and nearly all the fine kinds are planted in this county and produce large, sweet, and juicy fruit. Figs also do well and bid fair to produce a heavy crop. Some semi-tropical fruits are raised by a very few, but they are merely costly curiosities. Except figs and peaches, all other fruits, so far as I now remember, are costly experiments. D. H. H.

TEXAS, Arcola, Fort Bend Co., July 17.—There are only three crops grown here for market and they are known here as C. C. C., Cotton, Corn and Cane. The corn crop is very fine and will yield fully 60 bushels per acre. The cane is the finest that ever has been raised in this country and will yield fully two hogsheads of sugar per acre. The cotton crop is very fine and at present is fully two weeks in advance of last year; but cotton is a crop that is good to-day and to-morrow ruined. The acreage in these three crops is fully 10 per cent. over that of last year. The Cotton worm has made its appearance generally; but has done no damage yet. We are going to give the London-purple a trial. Potatoes, sweet and Irish, are only raised for home consumption. Of fruit there is none here to speak of. What peaches are here are only trash. F. W. P.

TEXAS, Meguel, Frio Co., July 14.—This country is almost entirely devoted to stock—cattle, sheep and horses in the order named, all of which are doing well. Some corn and cotton have been planted, however, but they promise small returns in this part of western Texas on account of the continued drought. T. J. E.

WASHINGTON TER., Alpowa, Columbia Co., July 11.—Wheat is the principal crop here, and the harvest will be late and light. Oats will be a medium yield and potatoes a full crop. Rye is not cultivated, and corn only sparingly so. Barley does well and yields abundantly. Chili Club is the principal variety of wheat. No sorghum is successfully grown here. Apples, pears, plums, cherries, peaches, apricots, grapes and all the small fruits grow well and produce abundantly. There will be an abundance of fruit this year except peaches, N. A. W.

WASH. T'Y, Seattle, King Co., July 9.—I am just opening up a farm ten miles from town, working like a beaver, early and late, very seldom go to town or have an opportunity to learn just how crops are doing. I hear, however, that wheat, oats, potatoes and barley are doing well. Rye is not grown to any extent here. Sorghum is not raised and but very little corn. Fruits of all kinds are promising better than ever. The following varieties, as near as I can learn, are best here. Apples:—Red Astrachan, Early Harvest, Summer Bellflower, Gravenstein, Twenty Ounce, Yellow Newtown Pippin, Spitzenburgh, Swaar, Blue Pearmain, Westfield Seek-no-Further. Plums:—Peach, Washington, Jefferson, Prune d'Agen. Cherries:—May Duke, Anne, Black Tartarian, Black Republican. Pears:—Early Madeleine Bartlett, Beurré d'Anjou, Clapp's Favorite. Fall pears: Winter Nells. Peaches will not amount to anything this year on account of "curled leaf." E. L. L.

WIS., East Troy, Walworth Co., July 12.—Winter wheat that was sown early is looking splendid; it is thought by many that it will yield from 20 to 35 bushels. Five or six times as much land was sown as usual. The variety mostly raised is White Russian. Not as much spring wheat as usual was sown—Lost Nation. Corn is looking fine, principally Dent. Potatoes are good. Oats are a good crop. Rye fair. Of barley not much is grown here. Sorghum is not much grown in this vicinity. There is a prospect of a good crop of Apples—Red Astrachan, Fall Orange, Fameuse, Willow Twig, Talman's Sweet. H. A. T.

The Querist.

ANSWERS TO CORRESPONDENTS.

The Striped Blister Beetle.

J. R. A., Williamson, N. Y.; F. O. Castleton, N. Y., and many others, too numerous to mention, have sent us specimens of a long, slim, striped insect till our sanctum is littered with small packages and striped bugs confront us whichever way we turn. All want to know the name of this numerous individual with the striped coat, and all complain that he devours potato tops at a rate and with a relish that completely outdoes the Colorado beetle, while at the same time he does not despise mangel-wurzels and other vegetables that happen to be at hand.

ANS.—This insect, which just now is causing so much anxiety, is the Striped Blister beetle, or the Lytta vittata of entomologists. It appears to be very destructive in many parts of the country, especially in New York, and it is also troublesome at the RURAL FARM. It is a Southern species, and it is seldom that it appears in great numbers so far north as is the case this year. The beetle is shown in figure 245. It belongs to the family Meloidæ, many members of which are destructive to vegetation. The female lays her eggs in the ground in July; these soon hatch and the young larvæ are said to feed upon the eggs of grasshoppers. There is but one brood a year. The beetles seem to have a preference for potatoes and tomatoes, but they also feed on mangels, beets, carrots and many other vegetables. Paris-green would kill them, but they are more sensitive than the Colorado beetle, and will submit to a less powerful remedy. A good dusting of plaster or ashes is sufficient to keep them off. It has also been recommended to scatter straw between the rows of potatoes and put fire to it. The quick burning of the straw will not injure the potatoes while the beetles will fly up, get caught in the flames and perish.

FIG. 245.

Buckwheat Culture.

J. W. S., Owensboro, Ky., asks all about buckwheat culture; the kind of land suitable for it, how much to sow per acre, and the probable average yield.

ANS.—Buckwheat completes its growth rapidly, and when grown for the seed it is time enough to sow it in July in the North and in July and August in the South. In your latitude it should be sown at once. It is peculiar in the fact that it will thrive on any kind of soil, though, of course, it does better on a rich soil than upon a poor soil. It is generally sown broadcast, about one bushel of seed per acre. The yield varies very much, about 30 or 35 bushels per acre are considered a fair crop. The seed ripens very unevenly, and if it is not cut it will continue to blossom until killed by frost; the crop should, therefore, be harvested as soon as the first seed is ripe, otherwise it will fall off and be wasted. It is tied and shocked like other grain, and thrashed when dry. Buckwheat has the reputation of being able to subdue the hardest and toughest kind of soil, overrun with weeds and unfit for cultivation. On this account it is often raised for a year or two on wild land before it is attempted to grow anything else upon it. But this redeeming quality is offset by its very exhaustive properties. It exhausts the soil greatly, and crops that are to follow it should, therefore, be liberally manured.

Smut in Wheat.

W. F. N., Burbank, O., asks what is the cause of smut in wheat, and whether it can be prevented.

ANS.—Smut is a fungus scientifically known as Uredo caries, which attacks the grains of wheat, and causes them to enlarge abnormally and form blackened fungoid masses. The preventive consists in killing the spores in the seed wheat, which is done by steeping it in a strong brine, or in a solution of sulphate of copper (blue vitriol). This is best done as follows: Dissolve a pound of this material in a couple of gallons of hot water, pour the solution into a tub and add three or four more gallons of water. Then place a basket in the liquid and turn the wheat slowly into it. Chaff, chess and light imperfect grains of wheat will float on the top and should be skimmed off. Let it soak for twenty minutes or half an hour, then lift the basket and spread the seed on the floor. Here sift some lime or plaster over the seed to dry it and then sow it at once. This process kills the spores, and the crop will, in most instances, be entirely free from smut. It has often been proved by direct experiment that if there is smut in the seed wheat, it reproduces itself in abundance in the crop.

The Onion Fly.

J. C. R., Belmont, Nova Scotia, says that a small maggot or worm eats the tops of onions there, close to the bulbs, and asks for a remedy.

ANS.—This destroyer is the maggot or larva of the onion fly, Anthomyia Ceparum. The fly deposits the eggs upon the leaves of the onion while the plants are still young; the eggs soon hatch and the maggots crawl down between the leaves where they at once commence to absorb the juices, and after a short time the plant turns yellow and ceases to grow. Many remedies have been tried, but none so far have proven of any value. Plants once affected are doomed to destruction. The best thing is to reduce the number of insects by pulling up and burning the sick plants. We have received many complaints of the onion fly this season.

Grape-Rot.

D. S., Tipton, Montana, asks for some remedy or preventive of grape rot.

ANS.—Neither cause nor remedy for this disease has so far been discovered. Like the pear blight and yellows it has baffled all efforts to discover the cause. Those who have given the subject much thought and investigation conclude that it is not a disease inherent in the vine, nor is it due to peculiarities of soil and cultivation, but rather to atmospheric conditions over which the cultivator can have no control. Old, strong-growing vines are most liable to be attacked, and the rot seems generally to start in a season of wet and sultry weather, and is most destructive in places where this state of the atmosphere occurs frequently. This is all that at present is known about the causes of grape rot. There is no known remedy.

Miscellaneous.

S. A. K., asks. 1, do bots ever kill horses by eating through the coating of the stomach; 2. why are not bicycles more generally used for travelling; 3. will pæonies blossom next year if transplanted now.

ANS.—It is the nearly unanimous opinion of veterinarians that bots are comparatively harmless, except when they accumulate in great numbers. A few cases have been noted, however, when owing to a morbid condition of the stomach to which they have been attached, the bots were so incommoded that in order to escape they perforated the walls of the stomach, allowing the fluids to escape into the abdomen, when death was sure to follow. But even in the few cases where a post-mortem examination showed them in this position, some veterinarians deny that the fatal injury to the stomach was wrought by them, maintaining that it was due to other causes. 2 Cost of bicycle, difficulty of learning to ride, and bad roads are doubtless among the chief causes, 3. Yes.

M. E. S., Fulton, N. Y., says:—"Please tell me the name of the contents of a box sent with this."

ANS.—A little box containing a single head of wheat has been received, bearing no decipherable marks of any kind by which we could identify it as coming from M. E. S. The variety is English Square Head.

J. B. H., Johnson's Junction, Ky., sends a flower for name.

ANS.—This seems to be Asclepias tuberosa, familiarly called Pleurisy Root and Butterfly Weed. It is a showy, beautiful flower, is cultivated for ornament in many parts of the world, and would be here if it were not a "weed."

A. C., Chenoa, Ill., sends a specimen of grass which has sprung up thereabouts for the last couple of years; stock don't like it, and it is considered a pest, and the name of it is wanted.

ANS.—It is Squirrel-tail grass—Hordeum jubatum.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, JULY 31, 1880.

Last week's Rural New-Yorker, referring to the Fair number to be published about September 1st, guaranteed an issue of "over 75,000 copies"—how much over we were not then prepared to state. We now guarantee that the edition shall be over 100,000.

Pictured Exaggeration. — Nurserymen, seedsmen and florists are now at work upon their Spring catalogues. We venture to offer the advice that they will, in their illustrations of strawberries, raspberries, flowers and vegetables, picture representative specimens and abandon the exaggeration which both deceives the public and wholly misrepresents the originals. At the Rural Farm we have raised wheat, the largest spike of which measures plump seven and one-quarter inches. There were hundreds measuring over six inches. Would it be fair, were we to offer this kind of wheat for sale, to present an engraving of this one head as a type of this variety of wheat? "Well, it is true to life," says the seedsman; "you are entitled to show the plant you intend to introduce at its best. It would be suicidal to picture the smallest head." But the truth lies between. The largest head is true to life certainly, but to individual life. And so of the smallest. The average size is that alone which conveys an impression which does not mislead.

OUR ABUNDANCE.

Statistical tables inform us that the United States, while it contains less than a sixth of the population of Europe, has four-fifths as many swine, a third as many cattle and a fifth as many sheep as are in all of the countries of Europe together. It is noteworthy that domestic animals everywhere decrease in numbers with the increase of human population. In China only so many of the smaller kinds, usually fowls, are kept as are needed to pick up the otherwise irrecoverable wastes. Our immense herds and flocks are the natural concomitant of our abundance of vegetable food beyond the capacity of our population to consume or export. In Europe, though a new country compared with Asia, the people are beginning to see that they cannot afford to transmute eight or ten pounds of nutritive seeds into one pound of flesh having little or no greater nutritive value than an equal weight of the material out of which it was formed. As tillage encroaches upon forage grounds, grasses and other cheap foods for domestic animals decrease in quantity, while grains are worth too much for human food to be fed out for meat. Consequently there is and must be a lessening of animal food corresponding to the decrease of available food for animals.

REMEDY FOR FOUL WATER.

The modern practice of getting the water-supply of cities and towns from ponds has revealed the fact that the waters of most ponds and reservoirs are liable occasionally to take on more or less unpleasant odor and taste due to the growth and decay of large numbers of aquatic plants of kinds so minute that they can only be seen with the microscope. It is uncertain whether water thus polluted is actually unwholesome, but it is essentially disagreeable and unpalatable; and it is still a greater puzzle how to prevent, or even hinder, the accumulation of this annoying vegetation in large bodies of water. Filtration of the water at the house of each individual consumer seems to be the best palliative hitherto devised, for in this way a great deal of the troublesome matter may be removed. Aeration of the water after it has passed through the pipes, or even letting the water stand for some time exposed to the air, is another device of merit. And by boiling the water before use, it is possible to dissipate some of the unpleasant flavor.

Doubtless many wells whose waters are not cold enough and dark enough to prevent the growth of such vegetation are liable to suffer in the same way as the ponds; and it is of interest to note an ingenious device for overcoming the difficulty in a body of water thus limited, which was recently put in use by a German near Hartford, Conn., as reported in the Courant of that city. To cure the foul well he first cleaned it out; he then put in a peck of salt, and, after the well had filled up with water, he again pumped it dry. The operation is manifestly of the same order as the sweetening of butter that "tastes of the firkin" by drenching it with brine. In both cases the solution of salt destroys the microscopic organisms which have caused rancidity.

THE PROPOSED NEW YORK EXPERIMENT STATION.

During the last session of the New York Legislature a bill was passed which provides for the establishment of an Agricultural Experiment Station in the State of New York, and the sum of $20,000 was appropriated for its maintenance. The bill provides that the affairs of the Station shall be governed by a Board of Control, of which six members shall be chosen by the six leading agricultural societies in the State, two members to be elected by the Board, and the Governor of the State and the Director of the Station to be members *ex officio*. The Board held a meeting in Cooper Union, this city, on the 20th inst., mainly to elect the two members required by the bill. A large number of representative farmers throughout the State also attended the meeting, thereby showing their interest in the matter.

At the next meeting of the Board, which will take place on August 4th, in the Executive Chamber at Albany, the question where to locate the Station will be brought up and perhaps settled. This point is of the greatest importance, and no decision should be made until the matter has been thoroughly considered in all its bearings. Two propositions have already been presented: one is to place the Station on Long Island, and the other, to locate it somewhere near Ithaca. If the Rural New-Yorker were selfish enough to consider only its individual preference, we should for many reasons favor Long Island as the site. But in this matter selfish preference should have no voice. It seems to us that in order to offer equal advantages to all farmers of the State, for whose avowed benefit this movement is inaugurated, the Station ought to have a central location.

Ithaca is objected to on the score that experiments of the kind that should take place at the Station are already under way at Cornell University. The same objection may be raised in regard to Long Island. Here is the Rural Farm, where trustworthy experiments with seeds, culture and fertilizers are constantly taking place. But why at Ithaca? The Station would be still nearer the center of the State if located somewhere in the Mohawk Valley, say near Utica. Here it would be about equi-distant from the extremities of the State, and all farmers who desire to visit the grounds, or who send articles for analysis, or who in any other way have intercourse with the Station, would enjoy equal advantages. If the experiment grounds were located on Long Island, farmers in the northern counties would certainly be at a disadvantage in these respects. Farmers, as a class, do not travel much, and a journey of 200 or 300 miles longer than need be, for the purpose of visiting the experiment grounds, is a matter of no little consequence to them. Moreover, the temperature and general aspect of the climate near Utica will be a fair medium of the climate all over the State, and on that account, too, the location is admirably suited for agricultural experiments, the results of which are to be applied to all sections of the State.

It has been suggested that Stations be established at half a dozen places, or at as many places as may be considered practicable, and that one of them be made the headquarters. This idea is excellent, if the funds for their support can be supplied; but if the funds should be lacking to make the work of real value, we are greatly in favor of a single Station well supported, and whose work can be relied upon in every respect.

We hope the Board will consider these points carefully before they make a final move in this matter, which, on behalf of the farmers of the State, has been left in their trust.

FARMS AND FARMERS.

Farmers, like poets, are born, not made. There are thousands who occasionally make rhymes, but never a line of true poetry, and there are thousands who labor on farms all their lives and still are never farmers in the true meaning of the word. It takes but little skill to hoe a row of corn or to dig a hill of potatoes; but when we come to the real, serious, practical business of farming, we shall find it is, from first to last, an avocation that requires as much soundness of judgment and clearness of foresight to insure success as any other trade or profession. It is true that Nature is bountiful in her gifts, and in almost every instance he who expressing his desires by both faith and works receives something; but it is only those who work with the spirit and the understanding also who receive the fullness of her bounty.

There are but few who have not sufficient ability to plow and to sow and to reap; but to know when and how to do these things in order to secure the greatest return, is given to but a very few of the many thousands who engage, either from choice or necessity, in agricultural pursuits. We say from necessity, for it often happens that we find on the same farm that has given employment and livelihood to his father, a man in no way fitted for the business, whose choice and success would have been in some other pursuit, but who as a boy was compelled to stick to the plow only for the reason that somebody must do it, and one son, at least, must remain to take care of the homestead and of father and mother in their old age.

Farming is not the only occupation in which those least fitted for it are employed. The fact that 90 out of every 100 who engage in mercantile affairs sooner or later go to financial ruin, and that the great majority of those who choose law, the ministry or medicine are never able to attain even moderate success, shows how little attention is given to the putting of a boy or a young man in the place for which he is by nature best fitted. This poor lawyer might have made an excellent farmer, while that poor farmer has in him latent power that, if cultivated, would have enabled him to take a high rank at the bar. But we did not set out to write an essay on the right man in the right place.

A successful farmer is one who is naturally a chemist. A farm is a laboratory where chemical changes are constantly going on either with or without the observation and aid of the farmer, and he only is the successful one who can make the forces of nature work for his profit.

There are certain things connected with farming that one not a fool cannot help learning, and a general routine may be followed that, taking one year with another, will result in producing average crops. But the true farmer is he who understandingly—we would say scientifically if the word was not so distasteful to many—departs from this routine and holds converse with nature, making a bargain with the soil, perhaps, that for a certain amount of particular care and fertilization a certain and large crop shall be returned.

It is said that a good chess player is able to give a reason for every move he makes, and a move that is made without an object in view is worse than useless. A commander in a battle field who has not clear and definite ideas of what he wants to do and why, sends his men to inexcusable slaughter.

So the farmer, who does not wisely plan and carefully execute his work, while his labors may not be entirely useless, only attains a partial success.

There is hardly one item of a farmer's business that may be done strictly by rule. Everything must be changed or varied to meet circumstances. That which would be advisable to do with an early Spring is hazardous in a late one. If the field is wet and the soil does not crumble when the furrow turns, let it alone and plow the other more sandy or higher one. This heap of manure, that in a dry time would be just the thing for a certain crop, must go elsewhere. Shall this field be plowed this Fall, or left till Spring? And so on through the thousand questions that are constantly arising. He who is competent, first, to see the necessity of asking them and afterward to decide them, is worthy of the name of farmer; others are laborers. Of the first there are few; of the latter, many.

A farmer should be a student of books as well as of nature, in order that he may profit by the experience of those who have gone before him. Every year people are repeating the failures of those who lived a thousand years ago. The necessity of an education for a farmer is not sufficiently appreciated. Thomas, who is to be a minister, and Richard, who expects to gather fame and riches as a lawyer, must be sent to college, while Harry, who is to work the farm, must be content, as he too often is, with such teaching as the district school affords. This is all wrong, and not until there is a change will farmers take the position in society to which they are entitled. As we sometimes see an eloquent minister or a talented lawyer who has attained his position by virtue of his own unaided intellect, so we sometimes find a thorough, scientifically practical farmer who has sought out in nature's own books, the fields, the knowledge necessary for making his labors successful and his life of use not only to himself but to all around him.

It should not be forgotten by those in others paths of life, that on the labors of the farmer depends their welfare. This is true to a greater extent than is often remembered. Suppose that every agriculturist in the country could, by some means, be changed instantly into a first-class farmer. It would be impossible to compute the wealth that would be added to this country during the next year. And everybody knows that a good year for farmers means prosperity to every branch of trade and commerce.

BREVITIES.

Prof. Thomas writes to us that he finds the larvæ of the Cabbage moth infested this season by a fungus and an insect parasite.

The old Mark Lane Express appears in its issue of July 5th, in a new and, in our opinion, a greatly improved form. This agricultural weekly was first issued in London, England, on the 2nd of January, 1832.

We are in receipt (July 26) of a box of peaches from Dr. McAboy of the Thermal Belt, of which we have several times spoken of late. The peaches were received in bad order owing to imperfect packing. But in size, coloring and quality they are better than any peaches we have seen in this market the present season.

Lilium superbum is now in bloom. Hundreds of these grow in the lowlands of the Rural Farm adding greatly to the beauty of the thickets and woods. This is the Turk's Cap lily which is thought by many botanists to be scarcely distinct from L. Carolinianum and L. Canadense. We have found them within a few days past of a wider range of colors than in seasons heretofore—some being of a pure lemon, others of a bright scarlet, all spotted with dark purple or brown—as well as the ordinary intermediate shades. We have never been successful with this beautiful lily in the garden. After a season or so of diminishing vigor, it has failed entirely.

As will be seen we have begun this week a radical change in the news department of this journal. Instead of the one or two columns that have hitherto been devoted to news, we now devote one entire page. This will enable us to keep our readers thoroughly informed, by presenting an epitome, at least, of the most important occurrences in the world's history from week to week. It may occur to our friends that even one page will scarcely suffice for the presentation of such a history; but deprived of all filling and sensational effect, facts may be stated in a surprisingly brief space. The news will be gathered from every source, and rewritten by two of the Rural editors—all trash will be rejected, and only such news as may in some way profit and instruct our readers will be placed before them.

The high prices that ruled for wheat during the past season, led farmers through the Northwest to sell, as a rule, all they could possibly spare, while the same cause seems to have deterred millers from laying in a heavy supply. Accordingly the latter through almost that entire section appear to be short of "hard," or "Minnesota" Spring wheat, so that it is reported that of the 304,730 bushels of the variety lately in storage in Chicago, 60,000 are to be sent by water to Milwaukee, and 100,000 by rail to points in the interior as far off as Minneapolis. In the absence of a sufficient supply of "hard," it is doubtful whether the mills will decide to take what is known as "soft" Spring wheat, or shut down until the new harvest is in the market. The new wheat in that region will hardly be ready for grinding before about the middle of September; for after it has ripened and been harvested it will require some time until it is dried enough for millers' use.

From a private, but trustworthy source, we are in receipt of the following important particulars regarding wheat:

Illinois, July 21, 1880.—There is a "boom" started in wheat, based on the fact that the crop will be short with us, shorter abroad, and the foreign demand large. For Illinois the quantity will be something more than last year, but the quality will be greatly inferior. The Chicago market opened at 85c., and has already advanced ten cents for No. 2, and may go 10 to 20 cents higher. For the center of the State and for the total country where the oats and wheat both were in the stage of filling and ripening the grain during the heated term from June 20 to 14th of July, the crops will be a partial failure, if not something worse. For a week, however, we have had a cool spell and this will be a godsend for all that portion of the northwestern Spring wheat region, where the wheat is in course of heading out and filling. In a few words, the middle cereal region, north of 40 deg. and up to 43 deg., has lost a large share of its oats and considerable Winter, and most of its Spring wheat. From present appearances the Spring wheat in upper Minnesota, Dakota and Manitoba will be exceptionally good, unless the weather should turn out hot and they get then a couple of weeks of heat and humidity.

Literary Miscellany.

NOT RURAL SIGHTS ALONE.

Not rural sights alone, but rural sounds,
Exhilarate the spirit, and restore
The tone of languid nature. Mighty winds,
That sweep the skirts of some far spreading wood
Of ancient growth, make music not unlike
The dash of ocean on his winding shore,
And lull the spirit while they fill the mind;
Unnumbered branches waving in the blast,
And all their leaves fast fluttering, all at once,
Nor less composure waits upon the roar
Of distant floods, or on the softer voice
Of neighboring fountain, or of rills that slip
Through the cleft rock, and, chiming as they fall
Upon loose pebbles lose themselves at length
In matted grass, that, with a livelier green,
Betray the secret of their silent course.

Nature inanimate employs sweet sounds,
But animated nature sweeter still,
To soothe and satisfy the human ear.
Ten thousand warblers cheer the day, and one
The livelong night; nor these alone, whose notes
Nice-fingered Art must emulate in vain,
But cawing rooks, and kites that swim sublime
In still repeated circles, screaming loud,
The jay, the pie, and e'en the boding owl
That hails the rising moon, have charms for me.
Sounds inharmonious in themselves, and harsh,
Yet heard in scenes where peace forever reigns,
And only there, please highly for their sake.

—William Cowper.

EDWARD BENTLEY'S DECISION.

CHAPTER I.

"She's coming—she's coming at last, I declare!" cried the Rector's sister, waving a note overhead in such a sudden rapture that the Rev. Edward Bentley had to put out one hand to save the cream-jug, and the other to prevent his small pile of letters from being swept on to the floor.

His amused look brought the young lady back to the duties of the breakfast-table, which, as usual, on those lovely June mornings, was set in the bay-window, that the brother and sister might delight their senses with the beauty and perfume of the flower-beds beneath it.

"I beg your pardon, Edward, but I have so longed to get her here ever since you were presented to the living! and there's always been something to prevent it, so that I was just beginning to be afraid she wouldn't come till the Summer was over, and here are half a dozen lines to say that she'll be at Spedham Station this afternoon by the 2:20 train. I am so glad!"

Who was *she?* Mr. Bentley seemed to know intuitively, for he asked no questions, but went on buttering his roll with rather a glum countenance. However, his bright little sister and housekeeper was too much excited to notice his silence.

"I shall put Edith in the room adjoining mine, then we can share the same dressing-closet. I wish I had had the piano tuned; she plays exquisitely, and can master all those tremendous bits of Beethoven you think so beautiful, and out of which I can only hammer discords and noise, as you politely told me the other day. And I intend to take her everywhere——"

But here the Rector rattled his cup and saucer impatiently.

"Some more coffee, please, Em, for I have fifty things to attend to this morning; and I have just been thinking, dear, that as I must go to town sooner or later, and see the lawyers, to make arrangements about the small property our uncle left us, I could not do better than embrace this opportunity."

"What opportunity?" asked Em, with a flush and a frown.

"Why, my dear, you know that I have deferred going because I did not like to leave you alone, and now I shall not have to do so. Your friend Miss Wilton will be here, and I shall have the satisfaction of knowing, not only that you will not miss me, but that you and your guest will be relieved of the constraint of my presence."

"Do I ever find it a restraint?" and the young lady's voice took an aggrieved tone.

"No, no; you are the best of girls, and have thrown yourself into all my plans so energetically, that I devoutly hope no other fellow will find out your perfections and run away with you. But you and Miss Wilton will have so much to say to each other, that of course I should be in the way."

"Why not tell the truth at once, Edward?" his sister demanded, hotly. "You have set yourself against Edith, without knowing anything of her, except from my descriptions; you have made up your mind not to like her, and when, for the first time since we came to the Rectory, she arranges to spend a few days with me, instead of giving her a hospitable welcome, you rush off."

Mr. Bentley was disconcerted by his sister's evident annoyance.

"You forget, Em, that Miss Wilton and I are strangers to each other."

"And you forget how tenderly she nursed me through my long illness at school, when no one else cared to come near me for fear of infection."

"I believe I wrote to the young lady, expressing my gratitude."

"Oh yes, you did and a very stilted letter it was, You had better write another to say that as you have no desire to make her acquaintance you beg to decline the visit she proffers."

Edward Bentley rose from his chair, and began to walk about the room; he did not wish to vex the sister he loved warmly, but he did not feel any desire to make the acquaintance of Edith Wilton. Her very name was odious in his ears; he had heard it till he was ready to declare that female friendships were detestable. There was his sensible, matter-of-fact little sister, who never rushed into extremes, who was so methodical in her habits, and not even romantic enough to appreciate Tennyson, always ready to rave over a mere schoolgirl—for no other reason, that he could discover, than because Edith Wilton was in every respect the opposite of herself.

Emily Bentley had been carefully educated at first under the eye of her mother; and after Mrs. Bentley's death, great care had been observed in the selection of the boarding-school, where she encountered Miss Wilton; whilst the latter had, by her own showing, lived a rambling sort of life. After the death of her parents, she had lived with an uncle and aunt.

The hideous photograph of her friend that Emmie had once shown her brother portrayed such a large-headed, unmeaning-eyed young female, that he hoped for her own sake his sister was right when she said that the photo did not do Miss Wilton justice.

To see such a creature take possession of his good simple-minded Emmie—availing herself of her girlish idolatry even while she ridiculed it, and very possibly making herself conspicuous in the village by her loud dress and manners—was a prospect that made him shudder: yet how could he induce Emmie to see her school-friend as he saw her, or how hint to her that, after a separation of three years her own tastes might have undergone such modifications, that she would feel as much disgusted with their guest as himself?

He glanced at his sister. She was still sitting at the breakfast-table with her head bent over the note—the free, bold calligraphy of which was another fault in the jaundiced eyes of Edward Bentley—and a large tear had just fallen upon it.

He was not proof against this token of distress. After all, what did the eccentricities of Miss Wilton signify, if Em wished to see her again? She was only coming for a few days, and after her departure they might have a hearty laugh together over what would be—or so he predicted—the last chapter of their girlish romance.

He came and laid his fingers on his sister's shoulder.

"After all, Em, dear, I think I'll postpone my trip to town. Shall I go with you to Spedham this afternoon to meet Miss Wilton?"

But for once Emmie would not accept the olive-branch. He had testified a wish to avoid her visitor—let him do so; the loss would be his own, and she was too lond, too proud of Edith, to wish to force her acquaintance upon the brother, whose prejudice she disdained to combat.

"Indeed I will not hear of you changing your plans!" she cried briskly. "After all, you were right; I shall have no time to feel dull if Edith spends the term of your absence with me; and I'm afraid that if you were here I should be tempted to neglect you for her. Go by all means! I must look to your collars and wristbands, so it will not do for me to loiter here. If you go down the village, you might as well ask Mrs. Brown to lend me her basket-chaise. Then I can drive you to Spedham, and dear old Edith back.

With the general inconsistency of human nature, Edward Bentley was not very well pleased to find his sister reconciling herself so quickly to his departure; but he assured himself that he was very glad she was so reasonable, and went away to hurry through a round of parochial calls before luncheon.

Emmie was too much occupied to join him at the meal, or even to exchange another word with him till she ran down stairs, buttoning her gloves as she came—to act as his charioteer. Neither did she mention the name of Edith as they drove along, but chatted cheerfully of the friends he would see, and the books for the school library he would be able to select, etc., till the station was in sight.

"There is one thing I have been forced to neglect through leaving home so suddenly," the young clergyman observed; "and that is carrying to the bank the sum of money I received for the local charities."

"Is it of any consequence?" asked his sister.

"Perhaps not; and yet it would be safer there than in my desk. Tell Myers to look out for Farmer Andrews when he rides by to the market-tomorrow morning, and ask the farmer to carry it to the bank for me. You will find it in a leather bag in the escritoire in my study. Don't forget this, Em. It is trust-money, and I should feel more comfortable if it were in safe-keeping."

She nodded, and threw the reins on the back of the fat, quiet little pony. The train was in, and a girl in a dark serge dress, fitting like a riding-habit to her small, slight figure, and a shady hat perched on wavy hair of chestnut brown, was standing on the platform with her bag, ulster and neat little umbrella, looking around her with rather a forlorn aspect.

Em flew towards the stranger, and her brother more deliberately followed; but the train that was to bear the Rector away was now approaching. There was just time enough for the briefest of introductions—a bow from the gentleman, a smile, sweet but reserved, from the lady—and Edward Bentley had to rush off, marvelling as he went how any photographer could have so caricatured the refined and pensive features of Edith Wilton.

Emmie's apologies for her brother's departure were good-humoredly received.

"It was very kind of Mr. Bentley to leave us to ourselves; he knew we should be brimming over with feminine gossip, and that we could not discuss the scandals of the parish, nor the last fashions, in his hearing. Oh, Em, I envy you: to have a fixed home—not a rambling one within the precincts of a garrison town, but really a home, and a brother with whom you go hand in hand in good works, must be very delightful!"

"To me it is; but you would soon find it irksome. Reading to old people, teaching at the schools, striving to drill the choir, and listening but too often to vexatious and trivial complaints is trying to the temper as well as the strength."

"And so is the life to which I am condemned," answered Edith, with a sigh.

Edith's delicate bloom deepened, but she said no more, and Emmie was silent, too. She guessed, however, that Mrs. Wilton, who was a notorious matchmaker, had been trying to hurry her husband's niece into a marriage repugnant to her feelings; and the sympathizing glance she turned upon Edith, brought into the bright brown eyes tears such as were seldom seen there.

But they were not allowed to fall, and it was with an assumption of gaiety that the guest exclaimed:

"Hurry, Em, for I am longing to see the rectory-house you have painted in such glowing colors. I have not had a day in the country, with leave and license to ramble where I please, since poor papa died, so I give you notice that I mean to make the most of my holiday. Do you bake your own bread and churn your own butter and grow your own strawberries? You do! that's good news, for I'm immensely hungry."

Before the day was over the two girls had explored the rectory from the leads on the roof to the cool, fresh dairy in the basement; had strolled through the village that Edith might make acquaintance with all Em's pet old-women and babies; climbed into the organ-loft at the church, and played over the exquisite bits from Handel and Mendelssohn, from Bach and Pergolesi, that Em loved to hear, though she did not possess her friend's mastery over the instrument; and on their way back to the rectory fallen in with the doctor's half-dozen merry children.

For these frolicsome imps they improvised high tea on the lawn, followed by a dance, which was kept up till the doctor himself appeared, to threaten them, in much displeasure, with pills and potions fifteen to the hour, if they did not all troop off to bed.

The next day was so intensely hot that Em and her friend were obliged to confine themselves to the house and the garden, reading, working, and conversing.

Remembering her brother's injunction, Em bade the gardener Myers look out for Farmer Andrews, about the time the worthy church-warden generally drove by on his way to the market-town, and Myers promised to obey orders with the promptitude that made him a favorite with the Rector, who had only lately taken him into his service.

Edith, who was sitting in the veranda, which just then was overloaded with climbing-roses and passiflora, looked thoughtfully after the man as he walked away.

"Is Myers your only man-servant?" she inquired. "He has been a soldier, hasn't he?" when Em had answered in the affirmative.

"I don't think so," was the reply. "Oh no, I am sure he has not; for he told Edward, at the time we engaged him, that he had always lived with an uncle who is a florist near London."

"I did not see his face," Edith observed, "but somehow his voice and figure seemed familiar; and he walks with a military step. I am sure he has been through his drill at some time or other."

"He may have been in a corps of volunteers," Em suggested. "He is an excellent servant, clean, civil, and active. I am all the more ready to dwell on his good qualities because I do not like him. Why don't I? My dear, it's a veritable case of 'Doctor Fell; the reason why I cannot tell.' Perhaps it's because I have a suspicion that he's not truthful; but as I've never detected him in a regular fib, I suspend my judgment."

The sultry day passed over, and the two girls, busy with some illuminated texts Em was at work upon for the church, did not notice the flight of time, till the neat parlor-maid came in to lay the cloth for the tea-dinner they had decided on having instead of a more formal meal.

"So late! and we have seen nothing of Mr. Andrews! I hope Myers has not neglected to watch for him."

No. Myers, on being questioned, assured his mistress that he had been at work in the front of the house ever since she last saw him, and was positive the farmer had not driven by.

"How very tiresome!" exclaimed Em, a couple of hours afterwards, as she and her friend stood at the open window in the twilight, watching the moon rise over the elm-trees that fringed the meadows. "That little bag of money is beginning to lie heavily on my conscience."

"Why?" asked Edith. "You are not afraid that it will be stolen, are you?"

"Oh, no! robbers are unheard of in this quiet place. But I do not like to feel that any wish Edward has expressed is neglected. He trusts to me so implicitly that I cannot be easy when I know I have not obeyed an injunction he has given me. I ought to have watched for Mr. Andrews myself, or have walked over to his house this morning."

"Is it too late to do so now? How far is it?" her friend inquired.

"A couple of miles by the road, but very little more than one by the river-bank and across the meadows. It would be a lovely walk, only——"

And then, to the surprise of her friend, Em blushed, stammered, and began to pick to pieces the flowers she had just been gathering.

"Over the meadows, and beside the pretty stream you pointed out this morning. Why, it would be delightful! and we should have the moon to light us home!"

"I could send Myers," said Em, half willing, half reluctant.

"And he might fall in the river, and lose the precious bag. No, dear, we ought not to fulfil your trust by deputy, but deliver the money ourselves to Mr.—Andrews did you call him? Why do you hesitate? Do you think the walk will be too much for me? If you did but know how many miles I have tramped with papa in the golden days of yore! I am ready—are you?"

As she spoke, Edith had thrown her gossamer white shawl over her head; and Em, when she had ruined all her roses but one lovely bud, fastened that into her brooch and ran away to get the leather bag from the drawer in the escritoire.

Without apprising the servants of their intention, away they went—Em a little nervous at finding herself in the lonely meadows after dark, but encouraged by the example of her companion, who tripped along fearlessly, and comforted by the knowledge that on their return the moon would have chased away the long shadows that now fell across her path and startled her.

They were noisily welcomed by the farmer and his rosy-cheeked daughters, and more quietly, but not less warmly, by a gentlemanly young man, who put aside his books to greet Em. and was introduced to Edith as Leonard Clinton, the son of an old friend of the family, who was studying farming under Mr. Andrews.

The motive of this late visit was explained, and Em's prudence, in ridding herself of so large a sum of money, commended.

"Your man Myers must be a stupid fellow," said the portly farmer. "He ought to have seen me when I drove by; I'm sure I'm large enough."

Laughing at his own jest, he insisted that his fair visitors should stay to partake of the supper then in preparation. Nor would he admit of their excuses till Miss Bentley had promised that she and Edith would let him drive them on the morrow with his daughters to a flower-show at a village close by.

As they ran laughing away, they found Mr. Clinton, hat in hand, waiting to walk with them over the meadows; and though Em had been very firm in declining Farmer Andrews' escort, her objections to Mr. Clinton's were so faintly offered, that Edith smiled slyly to herself at the incipient romance she detected.

At the gate of the rectory-garden their cavalier shook hands and went his way, but he must have carried Em's rosebud with him, for it was gone when she led Edith into the house, where Myers, brisk and smiling, was just emerging from the kitchen to bolt gates and fasten shutters.—To be continued.

SKETCHES OF GERMAN LIFE.

BERTHA A. WINKLER.

Emigrants.

The emigration fever has reached our village and there is a great commotion. Two canvas-covered wagons, already loaded with the effects of the emigrant party, elicit no end of comment from the bystanders on the probable future of their venturesome neighbors, whose hearts, so lately buoyed with hope of better days in pictured lands of wealth, seemed now to sink within them in that last hour with old friends and familiar scenes.

Though the last nights of the emigrants had been passed beneath the hospitable roof of neighbors in singing, drinking, and toasting, not a trace of their merry revels remained, as they made their customary farewell calls on the magistrate, the schoolmaster, and the pastor.

The parting with the latter started the sobs of the women and children afresh, and even the sturdy peasants grasped the good man's hand again, as they realized that it was indeed only "*auf wiedersehen* in heaven."

Once on the outskirts of the village they mounted the wagons, the driver cracked his whip, and they were driven away amidst the "*lebe wohls*" of those remaining.

It was only after they had gone some distance that the good wishes of the people were manifested in cheers and waving of handkerchiefs.

They were to sail from Bremen, and on the third day my good emigrants made their appearance on the vessel flushed and excited from travel, but otherwise in good cheer.

While the men stood on deck, smoking with the greatest complacence, the women trudged to and fro, carrying huge feather beds and other precious bundles, considered indispensable for German comfort, and which they had been informed could not be had for love nor money in America.

When they were informed that Americans had only blankets for coverlets they clasped their hands, and, in mingled surprise and pity, exclaimed: "Ach! ach! have they then no geese to raise feathers?"

The result was that before evening the whole party had determined not to begin life in the Far West without a flock of geese.

Hundreds of trifling little articles were thus dragged along, under the impression that they could not be obtained anywhere but in the Fatherland.

When the anchor was heaved and the signal given for starting, a motley crowd assembled on deck.

We distinguished Bohemians by their sunburnt oblong faces, their high-necked, Elizabethian ruffs, and their snuff-colored skirts tied around the knees. The peasants in their gay waist-coats and triangle hats. The quiet, good-natured Suab of the Black Forest and his better half, with an immense black bow flapping up and down on her head, like buzzard's wings, as she chased after the little ones playing hide and seek behind the masts.

Then, there were the townspeople of various grades; would-be students who escape the military law, sporting tasseled caps, short jackets, and high dainty buttoned boots; and girls, with nothing but a net for the head covering, casting sheep's eyes at them.

But all were watching more or less intently, the receding shores of the Fatherland. And when, at last, the highland mountain chain seemed about to dip under the sea, parents with one impulse snatched up their little ones exclaiming, as they pointed to the horizon, "See, yonder is Germany, you may never see it again!" Then there was a momentous silence, every heart was full of its own memories and emotions, and every eye was gazing wistfully homeward.

Once out on the open sea the vessel began to rock, and sea-sickness made havoc among the strongest. In less than a minute the deck was cleared, and down in the steerage the people were huddled together like so many dizzy flies; helpless and hopeless, wanting nothing so much as to be left alone. A few of the children and young people crawled on deck again after the first week, but they looked so pale and miserable crouching there in the sunshine, that even the rough and ready sailors withheld their usual broad grin and threw them some dried prunes instead.

Life now was anything but pleasant to the help-

less majority, as day after day they listened to the same dismal groans of the burdened vessel; the creaking of the chains, and the monotonous "Oho! oheo!" of the sailors, tugging at the rigging. Nor was the food calculated to tempt their appetites.

At six in the morning and evening the steward announced "coffee-water." Many in preference to the black, bitter coffee, break their hard-tack into a pan, add a little salt and butter, then have their hot water poured over all, thus making a kind of soup. The noon-day meals are alternately, rice and potatoes, barley and prunes, lentils and dumplings of flour, and pork and beans. The two dishes are always mixed and boiled in an immense kettle into a thin pudding; then it is measured out in suitable quantities for each family. The salt herring, unsavory butter, and hardest of hard-tack, which is distributed once a week, complete the not very tempting bill of fare.

Occasionally, on a moonlight night, the violin and guitar of some of the passengers were coaxed out and then the deck was transformed into a dancing floor, with the girls, the students and even the sailors off duty on the "light fantastic toe." Then, too, the most miserable would venture out on deck and watch the merry circle, or gaze into the moonlight waves and gather fresh hope as the good ship bravely plows the deep, and the friendly captain pauses here and there to point out to them the floating masses of sea-weed and the birds soaring around the mast as sure indication of the nearness of land.

"Land ahoy!" The welcome news from the watchman went from mouth to mouth. In a short time every body had rushed on deck to see nothing after all but more sea-weed and birds. But the captain leveled his glass straight ahead and a satisfactory smile passed over his face as he expressed the result of his observations in a cheerful "Keep looking, good people, keep looking." And they did most perseveringly. The minutes wore into hours, the morning into noon, yet not one had stirred from its point of observation. At last a faint eminence appeared in the distant, wave-skirted horizon; their anxious faces lighted and simultaneously a hundred hats were waved, and the whole assembly burst into the joyous salute "America! vivat America!" The sick, the aged and the little ones were helped up to feast their eyes in silent, tearful joy upon their future home.

The following day there was a general clearing up of one's goods. Straw mattrasses, old blankets, tin pans and kettles were thrown overboard with great satisfaction. The custom house officers next proceeded with their investigation without any difficulty until they came to the feather bundles. No reasoning and gesticulations of the peasant women could induce him to desist from searching them. In plunged the official arm and out flew the feathers, to the dismay and indignation of the owner.

We left our German emigrants at Castle Garden enjoying huge slices of bread and cheese while waiting for the train that is to take them westward, where we know they will, by honest industry, soon create pleasant homes and add to the wealth and strength of the New World.

THE WORLD'S FAIR.

For two years a constant agitation has been kept up in New York for the holding of an International Exhibition in this country in 1883. The dwellers in towns remote have, during this period, heard but little of the labors of the handful of public-spirited men, who have persistently carrried forward the movement to the point it has now reached. Patiently and prudently they have gone on from stage to stage, having the satisfaction at each successive step to witness a decided advance in all the essential elements of success. The holding of an International Exhibition in this country in 1883 is now an assured fact. The initiatory difficulties inseparably connected with a scheme of such magnitude, particularly those in regard to the obtaining of necessary legislation, have all been overcome, and the preliminary arrangements and complete organization of the United States International Exhibition Commission in 1883 are being pushed forward to a speedy completion. A special act of Congress providing for the holding of such exhibition has been obtained; bills have been passed in the New York Legislature granting to the Commissioners who may be appointed powers to acquire such lands, etc., as may be requisite, and the Governors of the several States are rapidly nominating Commissioners to assist the project to a successful termination. The plan of the proposed exposition is on a scale of such magnitude that it completely eclipses everything of the kind in the past, and may probably never be surpassed in the future, and the movement has now entered upon a career of popular recognition and public favor which guarantee the ultimate accomplishment of all its projectors have hoped to realize.

RECENT LITERATURE.

The Undiscovered Country. By WILLIAM D. HOWELLS. 1 vol., 12mo, $1.50. Boston: Houghton, Mifflin & Co.

Mr. Howells ranks among the foremost American novelists. His marvelous faculty for observing, and his rare skill in depicting character and describing scenery; the delicate sympathy with which he treats the persons who figure in his novels; and the exquisite literary art which adorns whatever he touches, supplemented by a noble refinement which pervades his stories, make the admiration and delight of his numerous readers.

"The Undiscovered Country" is, beyond question, the greatest novel Mr. Howells has yet written. It has the graceful and charming qualities of his previous stories, and, in addition, it introduces subjects of profounder interest. The treatment of Spiritualism is masterly and exceedingly engaging; and the description of life among the Shakers, with the incidental statement of their peculiar views is admirable.

The love-making is well represented, with warmth of hearty support and with perfect refinement.

The excellent humor and observation of natural scenes are as marked in this as in other novels by the same author. Popularity and permanent interest may be expected as the author's reward for this production.

Man Proposes. A novel of American Life. 16 mo. Cloth $1. Boston: Lee & Shepard, Publishers.

This is an anonymous novel. Its plot is original and interesting throughout. The characters are well drawn, and the writer shows skill in contrasting them. The general tone is extremely natural; the home and army scenes are portrayed in a light which reflects them clearly.

To be brief, readers can scarcely fail to be pleased with the style in which this story is written.

The Temperance Light. A New Collection of Gospel Temperance Hymns and Sacred Songs. By G. C. Hugg and M. E. Servoss. Boston: Oliver Ditson & Co.

This is a cheap (10ct.) Temperance collection, whose price will at once commend it, as its contents are not at all "cheap," but evidently carefully selected and condensed. There are thirty-two tunes, and the words and music were procured of twenty-seven different writers. It will be seen that two or three dollars will procure quite enough books for an ordinary "reform club."

Thanksgiving and Other Poems. By AGATHA. Price $1.25. New York: G. Putnam's Sons.

The opening poem, "Thanksgiving," is written in a pleasing manner, and the home scenes of a preparation for and a gathering of the family in the country homestead to celebrate Thanksgiving season is depicted in a peculiarly natural way. The other poems are good and well worthy a perusal.

VARIETIES.

CHARITY.—How noiselessly the snow comes down! You may see it, feel it, but never hear it. Such is true charity.

CIVILIZED POULTRY.—Among the announcements of articles offered for exchange in a paper devoted to such transactions there appears the following: "Wanted, a drawing-room suite for two portable fowl-houses on wheels."

MUSIC is an art which strengthens the bonds of civilized society, humanizes and softens the feelings and dispositions of men, produces a refined pleasure in the mind, and tends to raise up in the soul emotions of an exalted nature.—Brougham.

RHINE pebbles mounted in silver, and as brilliant as diamonds, are used for the ornamental darts, arrows, and daggers that are now thrust through the loops and braids of elaborate coiffures. The same showy white stones are also used for belt clasps, small buckles for satin slippers, and for lizard brooches that serve to pin a scarf of lace, or to hold a bouquet on the corsage.

A MAINE man who didn't care two shakes of a lamb's tail about the newspapers rode fourteen miles through a fierce snowstorm to get a copy of a weekly that spoke of him as "a prominent citizen."—Boston Post.

DR. TANNER, the fasting prodigy, is an Englishman by birth, and came to this country when seventeen years old. He is a well-preserved specimen of nervous-sanguine man, with excessively strong will-power. He has iron-gray hair and sharp features, and looks much more like a Yankee than an Englishman.

"HERE, somebody, quick! Where's an editor, anybody, quick!" and catching sight of the porter he went for him, and grabbing him by the collar he hollored: "Say, what natural in animal history—pshaw! What history in natural animal, I mean, at least, what animal in natural history does Chili resemble at present? Give it up? Why, the lammer of Peru, of course!" and with a wild and idiotic laugh he disappeared down the Common street stairs before he could be identified.—N. Y. Graphic.

THE question has recently been discussed with considerable earnestness by several scientists, whether marriage is conducive to longevity and a check upon crime and insanity. One of the latest authorities takes the ground that the statistics heretofore adduced as apparent proof of the beneficial effects of marriage are not trustworthy, and that two of the points most certainly decided are, that youthful marriages, either of women or men, are not conducive to longevity, and, second, that widows and widowers die more rapidly than either single or married persons of corresponding age. It is also said that it is a flagrant error to rush into marriage under the supposition that tendencies to criminality or insanity will be checked by such action.

THE glass of soda and the looking-glass resemble each other. You can see the soda's fizz in the one, and your own phiz in the other.—Boston Transcript.

There is at Brussells a curious case of chronic drowsiness. A man about 45 years of age, apparently in perfect health, has lately been attacked by an irresistible tendency to sleep. As soon as he stops walking or seats himself even to eat he falls into a deep slumber. All the remedies prescribed by the leading Belgian physicians have failed to produce any effect upon him. This is said to be the first case of the kind in Europe, although such cases are by no means rare among the negroes of Guinea, who call them Nelavan.

AN innocent youth from the public school brings his bleeding knuckles to his mother, asking for her sympathy:

"How were they damaged?" asks the lady.

"Oh, only against the other fellow's cheek-bone."

"Poor fellow, how is his cheek-bone?"

The scholar retires in indignation at the glaring absurdities of the female logic.

THE tribunal of the justice of the peace, of Geneva, Switzerland, has given judgment in a case between a servant and a master who gave each day the money for bread. The servant put the money in his pocket and ran up a bill at the baker's; the tribunal decided that the baker had acted imprudently, but that a master is not responsible for the debts contracted in his name, without his knowledge, by a servant. American tradesmen would suffer considerably if the law was so translated here. But who can say it is not just?

CHARLES DICKENS once wrote to Sir John Bennett the letter which has lately been published in the London Daily News: "My Dear Sir—Since my hall-clock was sent to your establishment to be cleaned, it has gone (as, indeed it always has) perfectly well but has struck the hour with great reluctance; and, after enduring internal agonies of a most distressing nature, it has now ceased striking altogether. Though a happy release to the clock, this is not convenient to the household. If you can send down any confidential man with whom the clock can confer, I think it may have something on its works that it would be glad to make a clean breast of.—Faithfully yours, Charles Dickens."

A LITTLE girl has been absent two weeks with her parents at a camp-meeting. On her return home her little playmate, Ella Day, entertained her by showing her her new playthings. At night, little Mary, in saying her prayers, said: "O Lord, bless Ella Day, and make her a good girl, so I can take all her playthings away from her, and she won't want them back again."

BRIC-A-BRAC.

"TELL us not in mournful numbers
Life is but an empty dream"
When milk is seven cents a quart
And raises mighty little cream.

THE mysteries of a baby's toilet were altogether new to a little four-year-old, and he carefully watched the bathing and dressing of his little cousin. When the little powder-box was open, and the fluffy brush was about to be used underneath the baby's chin, he exclaimed: "Oh, aunty, let me see you salt her."

A POSITION in life
At all worth the naming,
If you gain it, 'twill greatly
Depend on your aiming.

"YES," said a fresh girl at a show, "I know my beau goes out between acts, but he's nice and never drinks anything but a cup of coffee, because I can always smell it as plain as day, and I know the smell of coffee from beer or whisky, if I am a little bit green." It is a very happy thing for a young man to have a girl's confidence.

FROM a grave-yard in Conway, Mass.:

"Here lies little Willie
Fair as a lily,
God for him sent,
And we let him went."

A FOND mother wants to learn how her son will "turn out." That's easily done. If he's wanted to go out and weed the garden, he will "turn out" slowly and reluctantly and be two hours dressing. If he's called to see a circus procession go by he'll probably "turn out" quick and hurt himself trying to come down stairs and put a boot on at the same time.—Lowell Sun.

A TENDER young potato bug
Sat swinging on a vine,
And sighed unto a maiden bug:
"I pray you will be mine."

Then softly spake the maiden bug:
"I love you fond and true,
But O, my cruel-hearted Par
Won't let me marry you."

With scorn upon his buggy brow,
With glances cold and keen,
That haughty lover answered her:
"I think your Par-is-green."

A NEW PUZZLE.

A correspondent furnishes the following puzzle: "A sharp youth fresh from school having gone to visit a good-natured uncle, the latter placed on a table fifteen fine oranges and fifteen apples and desired his young friend to take half; he, not liking the apples, was about to take the fifteen oranges: but this monopoly of the best fruit being objected to, the old gentleman told him to range all the fruit in a circle and take away every ninth. The clever fellow ranged them in such a way, that by taking away every ninth, all the apples were left on the table, and the oranges transferred to his pocket."

A CLOTHES-LINE is a harmless thing
When stretched from pole to pole;
Until you step across the yard
And step into a hole.
Then, as you make a forward lunge,
It stops you, so to speak,
And throws you down and jerks you to
The middle of next week.
—Keokuk Gate City.

AN article is going the rounds entitled "What Kissing Really Is." Gentlemen, there's no use in trying to explain what it is, for you can't. Be satisfied that it is and always will be.—Kentucky State Journal.

A YOUNG lady who is studying French, lately wrote to her parents that she was invited to a *dejeuner* the day before, and was going to a *fete champetre* the next day. The professor of the college was surprised to receive a dispatch from the "old man" a day or two after saying: "If you don't keep my daughter away from these menagaries and side shows, I will come down and see what ails her."—Pittsburgh Telegraph.

For Women.

CONDUCTED BY MISS RAY CLARK.

LITTLE FEET.

LITTLE, jolly, human feet,
Caught in gaiters trim and neat,
Tripping lightly o'er the ground,
Just the echo of a sound,
Bearing down the great highway
Little maiden lithe and gay.

Lustrous, beaming, asking eyes,
Catching facts; demurely wise;
Scattering sunbeams everywhere;
Witching, winsome, wondrous pair,
Guiding down the busy street
Little maiden's fairy feet.

What her errand, what her task?
Bold the one who'd lightly ask.
Scarce she breathes it to herself,
Earnest, hasting little elf,
Gliding down the crowded way,
Little maid, with feet of fay.

Wondrous secret! Faithful heart,
Little woman's cunning art,
Not by glance or look or word
Shows she what her heart is stirred;
Stirred her heart, and sent her feet,
Swiftly down the busy street.

Here she enters; we without
Stop to find her secret out.
See! she buys a great wax-doll!
Errands done; yes, that is all,
Clasps, and hastens up the street,
Joyous maid with little feet.

DON'T!

BY MARGARET B. HARVEY.

DON'T get discouraged. This, however, I confess I am saying for other people, because at the present writing I feel very much cast down. I don't think I ever had an article in any periodical printed precisely as I wrote it, but within the last week or so I have noticed, it seems to me, more errors than ever.

I sometimes imagine that whatever I accomplish by my pen is counteracted by the mistakes which lay me open to the suspicion of ignorance and carelessness. Though, as regards the latter, it is a well known fact that in trying to avoid one fault a writer often inadvertently commits another.

For instance, regarding causes of discouragement, in my article on Gentlemen Friends there is a word printed "railing, which I am sure I wrote raillery." Quite a difference.

By the way, a friend criticises this sentence, "Let no man touch you except when you shake hands." She wants to know how about dancing, assisting a lady into a carriage, or, as young folks occasionally do, having a good game of romps.

Why, say I, all right, of course. I only meant to indicate in a general way what girls ought to do, leaving much to their own judgment.

Shall I say over again, Don't be discouraged? Indeed, I shall try not to be.

Don't whitewash the trees and rockeries in your lawn and garden. The white glare of the lime, these hot, sunny days, is something the human eye was not intended to stand. If you must have whitewash, have as little of it as you can; fences and chicken-coops are proper objects for it. Besides, think how unnatural are white trunks and stones, imagine the rugged bark in the woods, and the soft gray of the wild ravine smeared over with a monotonous coat of the blinding mixture.

Don't fill your vases with the dyed grasses, which, I suppose, will soon make their appearance, as they have done annually for several years past.

Who ever saw bright scarlet and cobalt blue and sulphur yellow, growing out in the field in the shape of grass tufts, either in one bunch or in several, so near together as to admit of being tied up in one? There are already many beautiful grasses of the natural colors, why should you want to improve them? You only spoil them when you try.

Don't wear your best silks and kid gloves this time of year. Put them away till Fall, and revel in light calico and lisle-thread. Simple attire is always in good taste for Summer. I saw two little girls—young ladies—only this morning, dressed in elegant white *pique*, trimmed with embroidery. But it was soiled and tumbled-looking, and the fresh ribbons didn't improve it a bit. I couldn't help thinking how much better would have looked plain ten-cent chintz exquisitely done up.

Don't get your children fine ostrich plumes for their hats and thereby deprive them of their excursions on the river. Don't give them sashes so wide, that they can't go to all the picnics.

Adornment of the body should always be next to the last consideration, health and comfort next to the first. And let me add, don't give them so few changes of garments that they can't make mud-pies and paddle in the creeks to their heart's content.

Don't have a handsome bonnet locked away and do without hiring a carriage, for a long ride through the lovely by-ways of your neighborhood, gaining health and happiness and inspiration. Oh, if I could say all I feel.

Don't enrich your wardrobe, so depriving yourself of books and pictures and concerts and pleasure trips, and above all the luxury of giving to others. In short, don't take from the inner to add to the outer person.

Don't misunderstand me. I believe in dress fully. I don't take the ground that adornment is vanity and that a true woman ought to neglect her personal appearance. I believe in judgment, in moderation. I know of a young lady who has half a dozen fancy silk dresses, and not one in its first freshness. If she had an elegant black and perhaps a seal-brown or bottle-green, in place of them all, she could always appear well dressed and have quite a nice little sum besides.

Is not a small spray of French flowers just as handsome as a large one? A short ostrich tip just as genuine as a long plume? A black velvet hat as rich as a white one? Is it not wise to wear thread gloves in Summer, and so better afford to have spotless kids in winter?

You see what I mean This is how young ladies no richer than yourself, but always as nicely dressed, manage to have money for new music, magazines, and singing and painting lessons.

Don't be discouraged. You and I can accomplish something if we try.

The lesson the writer has endeavored to teach ("Don't get discouraged") is a hard one for us to master, when we make the application "reflecting upon the mistake in the article, entitled "Gentleman Friends." Who would think that a few small letters could make so much mischief? As something animate must bear the blame—we shoulder it and beg pardon for the offense. R. C.

HOW CAN WE SAVE WORK?

WILL not some one of the ladies of the RURAL who give so many helpful hints to housekeepers write a treatise on "How to Save Work"? or, if you choose, give a more high-sounding title, as "Economy of Labor" and this, perhaps, is more expressive and appropriate, as economy signifies management, thrift and frugality; but of these three implied meanings it is to the latter that we have special reference.

Frugality, as opposed to wastefulness and extravagance in labor—such an intelligent expenditure of time and strength as shall exclude all unnecessary labor—for example:—the model housekeeper of our neighborhood. You may enter her house at any time of the day or any day of the week, search the house from cellar to garret and you will never find anything in disorder, not one particle of dirt or dust. And yet she does not get the mastery over these foes of the housewife by toiling early and late. The most noticeable part is that there is apparently very little work to be done. She seems to possess the talent of banishing dirt from her domain so that there is seldom any cleaning to do.

Her large and pleasant kitchen is used for dining and cooking purposes. The floor of this room, which is nicely painted, always looks clean enough to be used for a table. It is seldom cleaned (seldom here means once, twice or, perhaps, three times during the year); we know of its going at one time a year without being cleaned, and then did not show the need of it as much as ours did at the end of a week.

Her stove which always wears a first-class polish is blackened once or twice a year and fussed with very little in the interim.

It may be necessary to vouch for the truth of this—we therefore assure you the writer is a person of veracity and relating only facts. This may not seem as wonderful to others, but to us (who are obliged to thoroughly clean our work-room at least once a week and blacken our stove as often) it seems a most astonishing fact worthy of being recorded with the seven wonders.

Just think of the precious hours saved from these two household duties and add a corresponding number saved from sweeping and the care of other rooms, and what is to hinder the ladies of the farm from becoming accomplished in art, music, science, or whatever may be their hearts' desire?

Of course this model housekeeper cannot, herself, tell how she manages, but we have gathered a few points from observation. She never sets a kettle on her stove, that is blackened by smoke, but has a broad, flat iron to rest it on. She never turns meat in a spider when it is frying and spattering grease, but removes it to a work-table near at hand before taking off the cover.

She occasionally takes the dust from her floor by sweeping a second time with a cloth of coarse, rough texture over the broom. She never lays anything down out of place or allows one of her family to do so, and, what we consider most important, she has the masculine portion of her household under unusual subjection.

Their slippers are not merely for ornament but are always worn in the house. They have also learned that door knobs are for use and not for ornament.

We have many times come from this house inspired to go and do likewise, but have as often been compelled to yield to the force of circumstances or perhaps to a lack of knowledge or of talent in this direction.

Will not some of the RURAL sisters who are skilled in the art, reduce it to a science and give us the digest? AUGUST.

Many of our lady friends have given ideas upon this subject from time to time; but it would be gratifying to the above writer and to ourselves if some one would treat it in a more particular manner. "August" has escaped the waste-basket; however, her name and address would be acceptable. R. C.

A JAPANESE MANTEL LAMBREQUIN.

THE narrow mantel was painted black, so the lambrequin was tacked on the edge with small, brass-headed nails.

The materials were 1⅓ yard of yellow opera flannel, one dozen Japanese crepe tidies and bits of scarlet and purple satin, and bright velvets, that a friendly milliner laid aside for me.

The crepes were placed two inches apart on the flannel, one inch from the top and two inches margin at the bottom. The bottom, pinked in fine scollops, was embroidered with black and purple silk, herring-bone stitch, and the crepe tidies button-holed loosely on with scarlet and blue.

The spaces between the crepes were ornamented with velvet and satin designs of butterflies, dragon-flies and pagoda-shaped pieces, cut from patterns obtained from scrap pictures.

The mantel ornaments are two vases painted black, and Japanese pictures decalcomanied on and varnished.

Two Japanese fans in black and gold (with a stiff pasteboard back on which they are fastened) half opened and filled with pressed ferns, dried grasses, &c., make a very pretty basket which is the middle ornament on this very gorgeous and oriental mantel-piece. O. W. D.

FASHIONS.

THE prettiest of dresses for the seaside are the self-colored cretonnes with Madras borders; the waist is a jacket with pleats on each side, from the shoulder down to the edge of the basque. These pleats, which are applied on to the bodice, are of the Madras fabric; the overskirt forms two superposed shawl-points in front, each edged with a Madras border. At the back it is draped and also edged with a similar border; the underskirt cut round, without any train, has a deep kilting round the bottom; this kilting can be put on over coarse muslin to render the whole costume lighter or it can be merely tacked on under the edge of the over-skirt. The sleeves have facings of Madras, pleated at the top.

Dresses of percale or batiste, trimmed with printed borders, are all the rage. The printed borders are either in Madras patterns, or floriated, or in Japanese designs. With dotted fabrics the border is generally one of larger dots in the same colors.

The Madras kerchief is extensively used for trimming washing-dresses, and one kerchief to match is used to trim the hat.

Traveling-cloaks are made of fancy woolen material or light cloth, in the shape of a semi-long, semi-fitting paletot, to which is added an ample cape, coming down a little below the waist. There is a square collar of silk, fancy velvet, or satin, triangular pockets at the sides, just below the waist; large buttons of carved wood or dark pearl.

Among the prettiest of children's toilets for the Summer I may mention a frock of blue-spotted muslin-de-laine. Two hollow pleated flounces entirely cover the short skirt, while the bodice comes down very low, and is divided from the skirt by a blue sash tied in a bow at the side; this bodice opens in front with facings edged with white lace, over a long plastron of puffed white surah, and is finished at the top with a deep collar edged with lace. The sleeves have cuffs of the white surah edged with lace. The flounces of the skirt are also edged with lace. This is for a little girl about six or seven years old.

Another costume for about the same age is of light beige material and fancy-wool brocade in two shades of brown. The frock itself is of the beige material, and trimmed round the bottom with a deep kilting of the same. A drapery of the fancy brocade is arranged across the front, forming paniers at the side, and disappearing at the back under a loose puff, formed of the beige material, just above the kilting. A deep collar and cuff of this same brocade complete the trimming. This model can also be made of plain linen or cambric, combined with figured ditto.

For a girl of fifteen a dress also of the same shape, made of any light fancy woolen material, is trimmed with three rows of close shirrings down the front, and with a deep fluting round the bottom. To mitigate the stiff, straight look of this dress, a second skirt is added, on which is merely a sort of scarf drapery pleated across the front and draped up at the back into a tournure. This can be made either of the same or of some other material. If the latter, the fancy fabric should also be used for the collar, cuffs, and pockets of the dress.

FEMALE EDUCATION.—In the days of Queen Anne the education of women, as we understand the term, was very much neglected. The daughter of a country gentleman was taught the duties of a cook; sometimes, also, if the parents were ambitious that she should shine in after life as an accomplished hostess, she received lessons from a carving-master. The cardinal duty of hospitality, as she heard it inculcated at home, was for the lady to press the guests to repletion; while it was the province of the master of the house to make them drink to excess. This, perhaps, was a fitting education of a young woman who was to become the helpmate of a rude landlord, who regarded a wife as an upper servant, and who thought the company of women an irksome restraint upon the freedom of social intercourse. To a woman of any education and refinement, an English manor-house, during at least the earlier years of the Hanoverian succession, must have been an intolerable home.

CORRESPONDENT'S CORNER.

MISS CLARK:—In a letter of Miss Harvey's upon the subject of drawing, which appeared in the RURAL, June 11, last year, she says that she is able to give the address of a house for the sale of artists' goods, to any who wish it. I would like the address as I wish to purchase some of the patterns for pencil pictures for beginners as recommended by her.

Her interesting and instructive letter inspired me with a desire to learn to draw; but not until the past few months have I found the leisure for such an undertaking. At the risk of being considered a dull pupil by Miss Harvey, I cannot forbear giving a little of my experience and asking a few questions.

I have followed her directions carefully, drawing leaves at first until tiring of that, I have attempted engraving. By selecting the easiest subjects I could find I have done a few things that are quite satisfactory.

But in most engravings the lines are so fine and delicate that it is rather confusing, and I am becoming somewhat discouraged.

I wish also to learn to draw flowers sufficiently well to attempt something in water-colors. Would Miss Harvey recommend drawing from natural flowers or patterns. If flowers, which would she choose first, as earliest for a beginner?

I attempted a daisy, but failed miserably. Any information upon the subject, through the columns of the RURAL will be most thankfully received by a CONSTANT READER.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM "EVERY-DAY HOUSE."

ANNIE L. JACK.

An Ideal Summer Dinner.

"THE lamb weighs six pounds," said the amateur cook, "so an hour and a half will cook it. Let me see—what vegetables shall we have this very warm day? Mint sauce, of course, green peas—new potatoes. Yes the Beauty of Hebron are fit for the table." We planted a row side by side with the "Roses" and to-day (June 26th,) they are twice the size. Then a dish of cool lettuce, and a summer salad. This part of the programme was not difficult to carry out, an hour and a half doing all the work. For dessert we had strawberries and ice cream, the recipe for the latter I shall give you in part, copied from Marion Harland's Common Sense; we have tried it for years and always pronounce it delicious, while for a dessert to a Summer dinner it is refreshing and not unhealthful. I take the liberty of making it less rich than the recipe, and shall give it as we had it for that summer dinner:—

One quart of new milk, heated almost to boiling: the yelks of four eggs beaten light; two cups of sugar added to them, and the hot milk poured in, beating all the time. Put in the whites, well whipped, return to the fire in an *inner* saucepan set within one of boiling water. Stir till it is as thick as boiled custard, then set aside to cool. When cold beat in a pint of cream to which has been added the flavoring needed, also any coloring you wish. Have ready a quantity of ice cracked in pieces no larger than a pigeon's egg. Use an ordinary, upright freezer, set in a deep pail; pack around it first a layer of ice, then one of rock salt—*common salt will not do*. Take a long ladle before covering up, and beat the custard five minutes. Then pack ice and salt over all, cover with old carpet or any thick old woolen article, and leave for one hour. When you carefully uncover, you will find a thick coating of frozen custard around the sides. This you dislodge, beat again smooth and clear, put on the cover; pour off the brine, and pack again. The advantage of this *custard* ice cream is that it is smooth, fine, not so unhealthful as all cream, and if made at breakfast time, a few minutes during the morning for the extra beating will put it in order for the mid-day dinner. It requires no steady *grind*, and is superior in quality to anything of the kind we have ever made. So we all affirmed when the amateur cook brought out this crowning refreshment of our Summer-day dinner; nor did she seem to have been either tired or over-heated by her successful efforts.

LOG-CABIN SKETCHES; OR JESSIE SEABRIGHT'S DIARY, NO. 12.

MAY MAPLE.

MAY 20, 18.:—Not long ago John and I were invited to meet a company of friends at Mrs. White's. Now, some of the guests were from the "outside" world, and therefore knew but little about the economy necessary to be used in a new country. It so happened that Bertie's best winter suit was getting the worse for Sunday wear; and I had, as yet, been unable to get him anything suitable for Spring and Summer. I was in a dilemma for the first time in regard to his clothes. I might have left him at home, but Mrs. White had said, "Be sure and bring Bertie, for he will enjoy a play with the youngsters who will be here."

Well, if he went he must have something fresh to wear. So I searched over my "effects," but seemingly in vain; there was nothing available to make over, either right or wrong side out. While looking over bundles of all sorts that had been put away for future use, I opened, in a dreamy sort of way, a roll of pound calico, and began looking over the scraps. Was I in fairy land? Surely here was what would answer my purpose admirably: two or three remnants of plain brown, and as much more of a drab or linen color; plenty to make him two little suits—pants, shirt waists and coat; the last to be worn only on cool days. Of course, patterns and shears were soon found, and the little suits commenced.

Two days later, when we were ready to start on our visit, I was sure I need not be ashamed of our little boy's general appearance, though his play-mates were dressed in velvet.

"Where have you been to get linen for Bertie's new suit?" was Mrs. White's inquiry, as soon as we found ourselves alone, after she had expressed her entire satisfaction at the color, fit, etc. I told her all about my little economical plan. She also told me of the pretty compliments the little boy had received for his pretty, stylish suit, and gentlemanly ways. And yet the material for the two suits I had made, did not cost over twenty-eight cents; and they would last him many weeks for every-day wear. Of course, the little pants were lined. Now that I have been obliged to think and act for myself, I wonder that other mothers have not tried the experiment, rather than wait to be able to get cloth worth thirty or forty cents per yard, and meanwhile allow their five or six-years-old boy to go for weeks and, perhaps, months in untidy and uncomfortable rags.

DOMESTIC RECIPES.

Excellent White Cake.

Two cups of granulated sugar beaten to a cream with a scant cup of butter, then add a third of a cup of sweet milk, the whites of eight eggs beaten to a stiff froth, and three and a half teacupsful of sifted flour, with two teaspoonsful of yeast powder mixed with it. Flavor and bake in a moderate oven.

MRS. A. B. C.

Walnut Catsup.

Select young, tender walnuts; prick in several places with a large needle; bruise them with a wooden mallet, and place in a jar with sufficient water to cover them, adding a handful of salt for every 25 walnuts. Let stand two weeks, stirring two or three times a day. Then drain off the liquid into a saucepan; cover the nuts with strong, boiling vinegar; crush to a pulp; strain through a sieve into the liquid in the saucepan, and for every two quarts allow two ounces each of whole black pepper and ginger, and one ounce each of cloves and grated nutmeg, a pinch of cayenne pepper, a shallot minced fine and a half teaspoonful of celery seed. Tie all in a muslin bag and boil with the catsup an hour. When cold bottle and seal the corks.

Excellent Tomato Catsup.

Take a peck of *perfect*, ripe tomatoes; wash clean—they must be absolutely free from fermentation—cut in halves, put into a porcelain-lined kettle and boil until the pulp is dissolved. Strain and press through a colander and then through a fine sieve. Return to the kettle and add one ounce each of salt and mace, one tablespoonful each of black pepper and ground cloves, two of ground mustard, and one of celery seed—the last tied in a fine muslin bag. Boil slowly for four hours, stirring almost constantly the latter part of the time. More salt may be added, if liked, as also a little cayenne. Turn into an earthen dish to cool, and when cold add a pint of strong vinegar. Bottle and seal the corks and keep the bottles inverted in a cool, dark place. MARY B.

Keeping Catsup.

A friend tells us she experienced much difficulty in keeping her catsup from fermenting after bottling, until she tried the experiment of storing it in unused fire-places. She has no trouble now with the corks flying out or bottles bursting.

Eggs for Winter Use.

To two and a half gallons of soft water add two pounds of salt and two ounces of saltpeter. Boil 15 minutes and, when almost cold, stir in four tablespoonsful of quicklime. Let stand two or three days, then pack the eggs, small end down, into a stone jar and cover with the mixture. Keep where it is cool and do not move the jar. MRS. L. E. K,

QUESTIONS ANSWERED.

Grease on Carpets.

I HAVE been unfortunate enough to spill grease upon a Brussels carpet. How shall I remove it? MRS. L. JONES.

ANS.—Cover thickly with *dry* buckwheat flour. In a few hours brush off into a dust-pan and apply another coating of flour. Repeat until all traces of the grease have disappeared.

Washing Woolens.

Please give your method for washing flannels. M. I. W.

ANS.—Make a strong suds with good, hard soap in boiling water; throw in the flannels and let soak until cool enough to handle. Then wash—do not rub on soap—and throw at once into a tub of boiling water which has been slightly blued. Shake up and down with the clothes stick and when cool enough to handle wring out, snap, pull into shape and hang out. Just before they are dry take down, fold tightly and after an hour or so press, pulling into shape as you do so. If the flannels be much soiled, wash through two suds.

News of the Week.

MISCELLANEOUS NEWS.

Monday, July 26th, 1880.

THE Grand Army of the Republic, of Pennsylvania, completed last Friday a week's encampment at Gettysburg, Pa. The citizens of the town received their visitors in the most cordial manner and the encampment was in every way a success.

THOSE FRAUDULENT DIPLOMAS.

The case of Dr. Buchanan of Philadelphia who was recently detected in selling bogus medical diplomas, which we noticed in News at the time, is growing in interest. The list of graduates includes over 1,500 names and embraces the twenty two years from 1858 to 18 0. The amount of fraud which Buchanan has perpetrated is almost incalculable. In the year 1880, although only thirty students were in attendance, his list of graduates for that year figures up 105, and this large figure does not include those diplomas which were antedated—as many more in number. The returns from New Jersey show that for every one in his lists there are seven more that have been antedated, and not in his lists. If the same ratio holds good in every other State, then he has sold over 11,000 diplomas. The number of diplomas credited by him to Europe and Germany is less than twenty. That figure is ridiculously small, in view of the complaints lodged at Washington by our Ministers and consuls abroad. All diplomas of Doctor of Dental Surgery issued by him are bogus. Buchanan's College has not, and never had the power to confer such a degree; nor can it confer the degree of Graduate in Pharmacy. In publishing his reports for the years 1868 and 1869 Buchanan failed to give the States to which the graduates for those years belonged. For all the other years this information has been obtained. But it is not a safe guide in establishing the identity of any particular doctor, because many of them have purposely credited themselves to other States so as to avoid too positive an identification. These fraudulent doctors of medicine, with bogus diplomas, who impose upon an innocent and confiding public, are scattered all over the country and they are even to be found in Europe. To detect a bogus diploma, note the names written thereon and then refer to a list of Buchanan's faculty for the year in which the diploma was issued; if a name of any person who was not a member of the faculty at that time occurs upon it, there are grave reasons for suspicion. Further, any diploma containing the name of John J. Siggins is a fraud. All diplomas bearing the name of David Diller, or of R. A Simpson after 1878 are fraudulent. All diplomas purporting to come from the Livingston University of America is a fraud. All diplomas not having the name of John Buchanan are frauds. Many an eclectic "doctor" may have reason to tremble.

RECORD OF CRIMES.

On the 19th inst. a fearful tragedy occurred at Pittston, Pa. A drunken German shoemaker named Justin Hoffman, returned home from a day's debauch and, as usual, began to abuse his wife. She sat caressing their little child, and tried to soothe him with kind words; but he, on the contrary, became furious and seizing a shot gun, took deliberate aim at her and the child and fired. He then fired a second shot among the children playing out-of-doors, wounding two, one his own the other his neighbor's. The baby was shot through the head and died almost immediately, and his wife was hit in the breast and at last accounts was not expected to live. The murderer was lodged in jail.....Another tragedy took place at Lyons, N. Y., also on the 19th. A farmer named Solomon H. Easterly quarreled with his mother-in-law and ordered her to leave the house. On her refusal to do so, he dealt her a heavy blow on the head with an ax, from which she soon expired. He then attacked his wife with the same murderous instrument and killed her, and next he drowned himself in the Clyde River in two feet of water. He was said to be worth $20,000, was a temperate man and had but recently returned from Florida.

TOO RICH IN SILVER.

The accumulation of coined silver in the Treasury and sub-Treasuries of the United States is so great that it is very hard to find proper storage room for it. By the act of Feb. 28, 1878, the Secretary of the Treasury was directed to coin not less than $2,000,000 worth of silver bullion, nor more than $4,000,000, each month. The vaults of the Government now contain $70,000,000 in silver coin, of which $45,500,000 are in dollars, and the remainder in smaller pieces. The Government also has on hand $5,000,000 worth of silver bullion. This amount of coin takes up a great deal of room. The bulk of the load is carried in San Francisco and New York. Notice has been received from San Francisco that the overcrowded vaults will hold no more. It is impossible to induce the people to hold and use this silver as currency. It returns to the Treasury very soon after it has been paid out, in payment of duties or in exchange for silver certificates, a great many of which are in circulation, and still the work of coining the unpopular money goes steadily on, in compliance with the law, at the rate of $2,324,000 a month. This has been the average for 27 months, the total for these months being nearly $63,000,000 three-quarters of which remain in the Treasury.

The President has appointed the following Postmasters: Ole Selwig, at Wilhnann, Minn.; H. J. Northrup, Saginaw, Mich.; Oscar Eaton, Bryan, Ohio; Miss Sarah L. Christie, Nyack, N. Y..... Harry English, a notorious outlaw, who has for a long time been the terror of northwestern Pennsylvania, has been captured in Michigan. Harry is a lumberman, nearly seven feet high, weighing 250 pounds, though not fleshy, shrewd, courageous, cold-blooded and desperate. He had committed several forgeries in Bradford, Pa. When discovered, and an attempt was made to arrest him, he killed two of the officers and wounded several others. He then escaped to the woods and could not be found until a short time ago he turned up in a lumber camp in northern Michigan, and he was arrested by a detective from Philadelphia who disguised himself as a lumberman and became intimate with English. A reward of $2,200 was offered for his arrest.....George Hunt, a resident of Rye, and Warren Mead of New Rochelle, attempted to cross the railroad in a wagon at Port Chester, N. Y., as an express train was coming at full speed. The wagon was caught by the engine and reduced to kindling wood; the two men were thrown 30 feet from the crossing and instantly killed, and the horses were hurled down a steep embankment and also killed .....Early on the morning of the 22d inst., a sad accident occurred here. The tunnel which is being excavated under the Hudson River caved in, and twenty-one workmen were buried alive. It will yet take about 10 days to build a coffer-dam and make an excavation to the spot where the unfortunate men are supposed to lie.

Dr. Tanner, the starving man at Clarendon Hall, is still alive, and as lively as a cricket. He drinks water, but otherwise is still a teetotaller as far as abstinence from other liquids and food is concerned. At noon to-day he will complete his fourth week and enter upon his fifth. He has spoken but little of late, and he passes a great deal of his time in sleep, a symptom which the doctors regard as favorable. The marvel is, that a man who has fasted four weeks is living at all.

CLEOPATRA'S NEEDLE IN NEW YORK.

The world-renowned and time-honored Alexandrian obelisk, "Cleopatra's Needle," which was purchased by one of our citizens to be erected in New York, has arrived safely in this port. The Alexandrian obelisk is about 3,500 years old, having been set up in Heliopolis by Thothmes III., at least 1,600 years before Christ. It is an entire shaft of granite, covered with hieroglyphics descriptive of the power of Thothmes It weighs 196 tons, and is 69 feet and six inches long. At the top it is five feet 5¾ inches square, and seven feet square at the base. The inscriptions on the apex of the obelisk are much more finely cut than those on the sides. The inscriptions on the side which has for 19 centuries faced the Mediterranean Sea have been partly destroyed, but the other sides are considered to be perfect, and have been deciphered by many scholars, including Champollion and Kircher. The pyramidoid on the first side contains a carving of Thothmes represented as a sphinx seated on a pedestal. In both hands he holds a jar of wine, and the inscription on the pedestal calls him "the powerful bull, crowned on the city of Western Thebes, the Son of the Sun, Tahutimes" (Thothmes). The monarch is represented as making a gift of wine. A lot more of signs and figures which may interest students, but are very monotonous to the general reader, is found upon it. The obelisk will be erected in Central Park.

FOREIGN.

THE British Isles just now are unusually devoid of interesting news. In England the chief matters of parliamentary importance relate to the land question. Government, sometime back, introduced a bill called the "Hares and Rabbits Bill" with a view of giving tenant farmers the right of killing all ground game on their holdings; but the opposition was so vigorous that the measure has been dropped for the present. Another bill supported by the administration, for the relief of Irish tenant farmers who may be unable to pay their rent owing to the prevailing distress, and therefore liable to be evicted by their landlords without compensation for any improvements they may have put on their holdings, is being bitterly opposed by the Irish and English landed interests and it is doubtful whether it will be passed. This morning's cablegrams say that all crops are in such a fine condition in Ireland, that the relief committees organized to distribute help to the destitute, say they will soon close up affairs, as no further aid is needed. Great Britain has not yet got rid of her difficulties in Afghanistan, though since the accession of the Gladstone Ministry, she has been trying hard to get out of the trouble and the country. Lately Abdurrahaim, an uncle of the deposed Yakoob Khan, was named his successor with the consent of the British, who prepared to evacuate the place at once, after securing to themselves a mountainous strip of the country adjoining British India and giving them command of the chief passes and an easy entrance into the land in case of future difficulties, besides affording them Beaconsfield's "scientific frontier" good against any possible future Russian aggression from that quarter. The latest news, however, says that Ayoob Khan, another rival chief, is marching at the head of a formidable rabble to dispute Abdurrahman's title. This will doubtless cause fresh trouble for the British and probably delay their departure.

In France the Government has just given a full amnesty to the banished and imprisoned communists who created such havoc in Paris in 1871. The measure was strongly opposed by the Monarchists and the Bonapartists on the ground that many of the wretches were guilty of crimes for which a life-long imprisonment was a mild punishment, and that their return to France would inaugurate fresh scenes of disturbance and anarchy. Gambetta, however, and his followers were successful in carrying the amnestry, and the first use the returned radicals are making of their pardon is bitterly to assail Gambetta and his adherents as milk-and-water Republicans. The last report says that Gambetta is negotiating with the Bonapartists to form a union of that party with the moderate Republicans to oppose the red republicanism of the amnestied radicals and their rabble adherents. For the rest, crops are above the average of the last three years; the army is better disciplined, more numerous and in everyway more powerful than it has been *ever before*, even in the days the Great Napoleon, and there is little doubt but that even the Germans would find in it a much more formidable antagonists than the paper army of Napoleon the Little proved.

At the same time that the outlawed communists are received with rejoicings by their associates and given aid by the government, the latter has peremptorily banished the Jesuits on account of a nearly forgotten law passed about 1816, and which neither King, Rupublic nor Emperor had ever since thought of enforcing. The same law applies with equal force to nearly all the other religious orders in France, but it is highly doubtful whether the Goverment will dare to enforce it against them for fear of the consequent popular commotion. Meanwhile the Jesuits are receiving much sympathy and help, and many offers of asylum in other countries, and a large batch of them are coming hither.

In Germany Bismarck is taking a holiday and all things are quiet for the present. Crops are poor on the whole—below an average, and a good deal of trouble is expected from the probable drain of gold from the country to pay for foreign cereals, the importation of which will probably be heavy despite the import duties lately placed upon them to the joy of the native farmer but to the discontent of other classes.

In Italy the chief trouble is how to support an enormous army on so slim a revenue as the trade of the country can afford. Of late there has been a growing excitement about the repeal of an odious grist tax imposed a few years ago, and which bore with crushing weight on the lower orders. It has just been repealed to the discontent of the Government who don't see where the necessary revenue is to come from. In Spain the most notable topic now, is the approaching birth of the first child of the young king and queen, the ex-Archduchess of Austria.

In Russia there has lately been little or no trouble from the Nihilists. There is, however, a good prospect that the country will soon be embroiled in war with China; both sides are now making vigorous preparations for the contest. The trouble is about the old Chinese province of Kuldja which Russia held possession of during the internal troubles in China a few years ago. Now China reclaims it, and Russia says she will yield it only after her expenses there have been paid and her native friends guaranteed safety. The Muscovite war against the Turcomans is being pushed by Gen. Skobeloff, who distinguished himself so much at Plevna and elsewhere during the Turko-Russian war. By the way there is a report that he has been captured by the Turcomans and beheaded.

The main subject of interest in Europe, however, is the difficulty between Turkey on one side and Greece and Montenegro on the other. By the treaty of Berlin Turkey had to cede some territory to both of them, and hitherto this has not been done. Montenegro was to have a part of Albania, but the Albanians, one of the most warlike tribes in the world, hate the Montenegrins equally belligerent. Turkey, instead of handing over the territory, merely withdrew her forces and told Montenegro to take it. The Albanians at once flew to arms, and, so, up to to-day much threatening and a little occasional bloodshed have marked the dispute. To Greece the Porte refused to yield even half of the country suggested by the Berlin treaty, and lately a conference of the Powers that signed that treaty was held at Berlin to decide how much territory Turkey should yield to Greece. They ordained that Janina, Larissa and Melzovo with a strip or territory a little less than Greece demanded, but a great deal more than Turkey was willing to yield, should be handed over to Greece. The Porte refuses to do so, however, and both Turkey and Greece are busy preparing for war. Should this break out, no one can tell where it will end, as it is not improbable that it may lead to a general European struggle.

AGRICULTURAL NEWS.

The July report of the Department of Agriculture shows the condition of the tobacco crop as follows: Acreage as compared with last year, in Massachusetts, 98 per cent.; Connecticut, 115; New York, 104; Pennsylvania, 113; Maryland, 60; Virginia, 75; North Carolina, 109; Tennessee, 92; Kentucky, 99; Ohio, 102; Indiana, 89; Illinois, 99; Wisconsin, 104; Missouri, 91. These States raise more than nine-tenths of all the tobacco raised in the country. The States which grow the bulk of the seed leaf tobacco, viz, Connecticut, New York and Pennsylvania, are increasing their product. The condition of the crop for the whole country is slightly below that of last year..... The famous herd of Polled Angus cattle owned by the late Mr. W. McCombie, of Tillyfour, Scotland, some prize groups of which have been illustrated in the RURAL, is advertised for sale by auction on August 26.....On Tuesday, July 20, the Board of Control of the projected New York State Agricultural Experimental Station assembled at the American Institute in this city, in accordance with a resolution passed at their meeting in Albany on the 14th inst. The following is the complete list of the members of the board:—Governor Alonzo B. Cornell, President; General N. Martin Curtis, of Ogdensburg, President of the State Agricultural Society, Secretary; W. A. Armstrong, Master of the State Grange; Patrick Barry of Rochester, President of the State Horticultural Society; James McCann, President of the Elmira Farmer's Club; Samuel Campbell, of Utica, President of the Central New York Farmer's Club; Shelby Reed, of Scottsville, President of the Western New York Farmer's Club, whose headquarters are in Rochester; Robert J. Dodge, President of the American Institute Farmer's Club; Robert J. Swan, of Geneva, and Richard Church, of Belvidere, Alleghany County, both of whom were elected at this meeting, the others having been chosen at Albany, as mentioned here in our last issue. After some discussion on general topics, the meeting was adjourned until August 4th, when the site of the Experiment Station will be decided upon. Some consider that Cornell University, Ithaca, N. Y. is the most suitable place, as the University has already started an Experiment Station of its own: while others maintain that some place on Long Island, not far from this city, would be the most suitable situation. The Director of the Station will be chosen at the same time the site is determined upon.....

Peaches are arriving in New York in sufficient quantities to meet the demand, The chief variety is Hale's Early. They bring readily $1.50 a basket. Of other varieties there will be Troth's Early from lower Delaware and lower Maryland, and some very nice ones from along the Delaware and Dorchester Railroad, and from Laurel, Delaware. The crop, both in Delaware and Maryland, is very large, and the coming week will bring some very heavy shipments by rail. New Jersey will only have a fair crop, but larger than last season's. In the lower end of Cumberland County it will be a total failure. The greater portion of the late fruit comes from the Hudson River towns. The yield this year is large.....Some time back we commented upon a report that was "going the rounds," to the effect that the Earl of Dunmore, had purchased a vast tract in Montana, and intended to stock it with great herds of cattle to be improved by heavy importations of English thoroughbreds. Last week he sailed from this port for home, and before his departure emphatically contradict this sensational rumor .... Russia denies that she intends to forbid the export of cereals, and says the reports of failures of crops are greatly exaggerated.

Value of domestic breadstuffs exported from the United States in June, $28,049,859; June, 1879, $17,210,710; during the 12 months ending June 30, 1880, $277,326,762; same period in 1879, $201,-76,499 .....Reports from Monroe, Mich., state that a severe storm broke over that city on the 18th inst., and destroyed much property. Hail and rain fell in enormous quantities with frightful velocity. Many hailstones were of the size of chestnuts. Gardens, orchards, and fields were destroyed in a few moments. More than 50 acres of choice Catawba, Concord, and Delaware grapes were utterly ruined, entailing a loss of nearly $40,000. The damages to windows and dwellings was also great. The total loss will not fall short of $75,000.....The report of the Veterinary Department of the British Privy Council shows that during the week ending June 26, 42,205 animals were exported from Ireland to Great Britain, including 12,088 cattle; 26,521 sheep; 2,649 swine; 128 horses; 198 goats; 20 asses, and *only one mule*.....During the whole month of June the number of stock shipped from the United States and Canada for Liverpool, England, was as follows: Of cattle, 10,642 were shipped, of which 114 were lost on the passage; of sheep, 9,-435 were shipped and 171 lost; 502 pigs were shipped and 21 lost. The loss in transit was therefore only a fraction over one per cent. in cattle, and a little over one and three-quarters per cent in sheep. There was an increase of 6,185 animals in June compared with the returns for May.....

The potato blight has shown itself in several parts of county Clare, Ireland, and also in several other counties ..... Out of 32,237,958 sheep which the agricultural returns gave as the number of sheep in the United Kingdom last midsummer, rot has destroyed a total of 2,889,000, equal to nine per cent. of the sheep and lambs in the country. To this must be added the deficiency of the present season's lambs and the loss by the death of breeding ewes, so that it is computed that five and a quarter million sheep and lambs have been lost by the pest in one season.....

Half the oleomargarine is made in Holland. Mr. D. Orlobo de Castro, of Amsterdam, is now in this country buying stock for his savory business. He gets material in Chicago, St Louis, Louisville, Cleveland, Detroit, and Buffalo. Material is rather scarce. The consumption of oleomargarine is steadily growing in Holland and other countries where pasturage is poor.....The entire import of wool at the ports of Boston and New York for the six months of the current year were 73,417,786 lbs, an increase of more than 56,000,000 lbs over the corresponding imports for the first six months of 1879.....Australian wool can now be laid down in Boston 44@45c. for average lots, and 47@50 for choice, and has been selling of late at about the cost of importing. The Shipping List says that it appears that present rates in that market are likely to be sustained, the extreme views of holders in the interior are not likely to be realized for some time to come, and that unless some concession is made, considerable of the clip is likely to remain in the hands of the growers....

We learn by a cablegram from London, dated July 22, that the report of Clare Sowell Read and Albert Pell, who were sent by the Royal Agricultural Commission to the United States and Canada to inquire into the state of agriculture, is published. They say that while many of the prevailing conditions are favorable in America in the contest for agricultural supremacy, still drawbacks exist which tell in favor of England. The severe Winters suspend agricultural employment. Drought, injurious insects, and in the prairie country a short supply of water, endanger the crops Western America possesses singular advantages for stock-raisers, while the Middle States afford them excellent pasturage and the Eastern States good markets. The allotment of land, and the termination of free ranges in the West will increase the cost of cattle-raising, but the increased consumption by the growing population will enhance prices. The success and extension of the growth of Blue-grass opens fresh prospects for the grazier, and will in time bring the improved turf under the hoof of thoroughbred stock, or at least of highly-graded cattle.....The Toronto "Globe" publishes the crop reports from over 400 places, every province in the Dominion but British Columbia being represented. The general appearance of the crops is satisfactory Only one crop—Spring wheat—shows any serious

deficiency. The indications are that corn will be 10 per cent. below the average. The crop of apples and other fruits will be above the average. Peaches will be very good. The report from Manitoba and the Northwest shows that the acreage under all kinds of crops has been very much increased, and that a bountiful yield of all kinds of produce may be expected.....The acreage of vines in California is officially rated at about 60,000 acres, and it is thought that from six to eight thousand acres more will be planted to vines this year. If the entire grape crop were made into wine the yield in ordinary years would exceed 25,000,000 gallons. The actual wine product during the past five years has ranged between 4,000,000 and 6,000,000 gallons, the smallest yield falling in 1878. The possible yield in wine is lessened by the large distillation into brandies (about 250,000 gallons a year) the production of sweet wines, the consumption of grapes for table use and export to the Eastern States, and finally by the manufacture of raisins. The wine yield this coming year is expected to be very large, perhaps 10,000,000 gallons..... In Germany a bill has been introduced into the Reichstag giving the government a tobacco monopoly; but although Bismarck strongly favors the project, there is but little chance of its passing—except the Chancellor may once more threaten to resign unless he has his own imperious way .....A leading Liverpool (Eng) grain circulator of July 23, says: "The few days of fine weather, though causing consumers to hold off, do not affect the value of wheat generally, except for some inferior descriptions. Tuesday's quotations are maintained. There was an average attendance at to-day's market, but there was a dull feeling and a very indifferent demand. Red wheat declined 1d. White was in small supply, and realized previous quotations. Flour was in moderate inquiry. Winter wheat and other choice qualities, from their scarcity, ruled strong. Corn was in limited supply, and, with a fair consumptive request, improved 1½d to 2d."..... The average price of farms in this country, according to the report of the Agricultural Department for 1879, increased in that year eight per cent. the increase in the average value of timber land being altogether larger than for cleared lands.....The cereals of the United States census of 1860 were 867,000,000 bushels; the record was 1,239,000,000 in 1870. By the estimates of 10 years the advance has been from 1,450,000,000 in 1868 to 2,302,000,000 in 1879.....Gen. Robert Toombs is one of the best farmers in Georgia. He made this year 350 bushels of white rust-proof wheat on 11 acres of land. He gave 100 bushels, worth $10 a bushel, to the State for distribution among the farmers of Georgia to sow for the next crop.

Alexander the Great

wept because there were no more worlds to conquer, but the proprietors of Dr. Pierce's Family Medicines who have found it necessary to establish a branch of the World's Dispensary at London, England, in order to supply from that great commercial emporium these remedial blessings to foreign countries, where they are largely in demand, do not share the great conqueror's sentiments, as their conquests are of disease and have made happy not only the conqueror but the people who employ them. Dr. Pierce's Golden Medical Discovery cures all blood and skin diseases scrofulous affections, swellings and internal soreness. Dr. Pierce's Pellets are the little giant cathartic; Dr. Pierce's Extract of Smart-Weed, the great remedy for colds and all bowel affections as diarrhœa, dysentery and flux. World's Dispensary Medical Association, proprietors, Buffalo and London.

Kidney-Wort is an unfailing remedy for that tormenting disease piles. It moves the bowels gently and freely, and then removes the cause.

Men of endurance have healthy kidneys and liver. Lame back, constipation and piles are unknown to them. The remedy for these diseases is Kidney-Wort.

WOMEN that have been given up by their dearest friends as beyond help, have been permanently cured by the use of LYDIA E. PINKHAM'S VEGETABLE COMPOUND. It is a positive cure for all female complaints. Send to Mrs. Lydia E. Pinkham, 233 Western Avenue, Lynn, Mass., for phamphlets.

Gleanings.

Creameries and individual dairymen, if they really wish to make a gilt-edged article of butter, that will sell at the tip-top market, ought to use Higgin's salt. That this is the finest quality of salt for dairy purposes to be had we consider a fact well established.—Farm Journal.

That's what we have been preaching for the past year, and the more experience we have with salt, the more we are convinced of its truth. We don't like the Thurbers, because of their connection with the "oilymargarine" business, but as importers and agents of the Higgin's salt they are public benefactors.—Democrat, Bellefonte, Pa.

There is no doubt about the superiority of Higgin's salt. Both the sweep-stakes prizes at the International Dairy Fair for the "best butter made anywhere" were salted with it, as were also a majority of the other prize lots. When the difference in the cost of using Higgin's English salt and the cheapest American salt is only about one-thirtieth of a cent a pound on butter, and one-sixtieth of a cent a pound on cheese, and it might make fifty times this difference in the value of the product, one would think that butter and cheese makers would not hesitate long in deciding what salt they would use.—American Dairyman.

The delicate structure of the skin renders it sensitive to the slightest obstructions, whether arising from sunburn, dust, or the changing air and wind. **Burnett's Kalliston** is prepared expressly to remove these.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 24, 1880.

BEANS AND PEAS.—Business in beans and peas has been very light during the week. Exporters have made little inquiry and home trade wants are now small. Prices are easier for general stock, but prime hand parcels are held above our quotations with confidence. Southern B. E. peas, $2 for prime 2 bush. bags, which are scarce at this season. Green peas steady with sales at $1 60 for Wis. bbls.

Marrow beans, prime, $1.60@1.62½; other, $1.50@1.55; medium, prime, $1.37½@1.40; other, $1.25@1.35; pea, $1.45@1 60; white kidney, $1.70@1.85; red kidney, prime $1.40 other, $1 25@1.35; black (or turtle soup), $2 20@2 25; Lima, Cal., 7@8.

Receipts of beans for week, 1,974 bush.

BEESWAX—Steady at 23c. Receipts of Southern quite large.

BROOM CORN.—Demand is slack and prices nominal.

Brush and short broom, choice, per ℔., 7@8c.; common to good, 5@6½c.; hurl, good to choice, 7@8c; do., common to fair, 5½@6½c.; red and crooked at 3@4c.

BUTTER.—The local demand is fairly active and readily absorbs all of the fine portion of the receipts. The scarcity of choice creamery and extra-quality half-tubs has warranted sellers in asking stiffer and higher figures. Shippers are in market regularly; and though their purchases have not aggregated the wholesale extent that sellers would like, their visits indicate the settled position that American butter has obtained abroad. The liberal export of the week is largely stored Western. Unfortunately, shippers have not access to such large quantities of fine table grades that the previous Summers permitted. Upper grades of any style of State are at present needed for home use; but the scarcity now may tend to promote wholesome competition later when fine dairies are loosened. It can be inferred that State stock will have most of the market held to itself as the West reports a poor year for average quality. With the firmer tone in State all useful Western finds a ready sale.

Creamery, finest State, 26c.; do. Western, 25@25½c; good to prime, 24@24c.; fair to good, 22@23c.; sweet cream, fine, 24@25c.; other, 22@24c.; State, yellow firkins, 20@22c.; prints and hf. tubs, choice, 23@23c.; good to prime, 21@22c.; fair to good, 20@21c.; poor 18c.; Welsh choice, 22c; other, 18@20c.; Western imitation creamery, 18@20c.; dairy, fresh, 20c; good to prime, 18@19c.; poor to good, 14@18c.; factory, best, 18c.; poor to prime, 13½@17c.

Receipts for week, 36,396 pkgs. Exports, 23,281 do.

CHEESE—The demand has been quite brisk this week, and up to 10½c. was made for fancy factories, but at the close there is an easier feeling through larger receipts and the market has eased off to 10c. The exports for the week have been 120,800 boxes.

Quotations: State factory, fancy, 10c.; do. good to prime, 9¼@9½c.; do. fair to good, 8½@9¼c.; do., half skimmed, 6@7½c.; Wisconsin factory, fine, 9½@9¾c.; do. good to prime, 8¾@9¼c.; do. fair to good, 8½@8¾c.; Ohio factory, fine, 9@9¼c.; do. good to prime, 8½@9c.; do. flat, fair to good, 7½@8¼c.; do, poor to fair, 6½@7½c.

Receipts for week, 125,326 boxes.
Exports, 120,380 do.
Liverpool cable, 51s.
Steam, 40@45s.

COTTON.—The market has been quiet and showing slight fluctuation—only; latest prices are for July, 11.34c.; August, 11.27@11.28c.; September, 10.88@10.89c.; October, 10.63@10.64c; November, 10.40 December, 10.40 @10.41c.; January, 10.47@10.46.; February, 10.58@10.61.

Quotations for spot cotton are based on American standard of classification, and all cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*N. Orleans and Gulf.*	*Texas.*

Good ordinary	7 15-16	Low middling	9 7-16
Strict good ordinary	8 13-16	Middling	10⅛

DRIED FRUITS.—The market generally is very quiet and prices altogether nominal. Quotations:

For North Carolina apples, fair to good, at 6½@7½c.; choice, at 8@8¼c.; New York State quarters at 7½@7¾c.; patent evaporated, in cases, choice at 11@11¼c.; good and prime 13½@14c.; evaporated, sliced at ——c. Evaporated peeled peaches, good to choice, at 26@27c.; North Carolina peeled choice, 16@17c.; Georgia prime at 15@16c.; fair to good at 13@14c.; common at 10@12c.; unpeeled halves at ——c.; do. quarters at 6@6½c. Pitted cherries old at 15@16c. Blackberries nominal. Raspberries nominal. Plums at 17@17½c.

EGGS.—Receipts for week, 8,500 bbls.; do last week 8,000 do. Light supplies have kept the market strong, especially as the demand has been more urgent. Near point and Penn. eggs show holding in many instances and prime refinable marks of Western sell about as quickly as any grade. The top rate for New Jersey do not represent lots above basket size.

Near Points, 17½@18c. ₰ doz. State and Penn 17½@17¾c. Western, fresh, 16@16¼c. Canadian, 16@16½c.; poor Western, 15@15½c.

FEED.—Sales are at $16.50@17 for 40 to 60 lbs., and $17@18.50 for 30 lbs.; $23@24 for 100 lbs.; $21@23 for Sharps and $20 for rye feed.

FRESH FRUITS.—There is a better movement in apples, still there are plenty of cheap, slow-selling open heads offering, many of which are freely quoted at 75c. Peaches are improving in quality and trade is brisk with lower prices. Hale are neglected now that Troths and fair Crawfords are here. Very fancy Southern are only used by extra grocers and Broadway stores. Pears are in good variety but thin are not in large lots. Grapes are here in advance of the demand. The weather is severe upon tender fruits and grapes. Berries and currants are frequently at buyers' option.

Apples, strawberry, $1,25@1.75; Summer pippin, $1 50@1.75; Nyack pippin, $1 50@2; red Astrachan, choice, $1.50@2; common, 75c.@$1.25; Sweet Bough, 75c.@$1.50; Sour Bough, $1,00@1.50. Peaches, Jersey, Hale's Early, ₰ basket, 50@75c.; Md. & Del., Crawford, cr., 3@$3.50; Troth, ₰ cr., $1.50@2.25; per bask., $1@1.37; Hale's Early, ₰ cr., $1@1 50; Hale's, ₰ bask., 00c.@$1.12; N. C. prime, ₰ bu. cr., $2 50@3; poor to good, ₰ cr. $1,50@2; Ga. fancy, ₰ 3 to bu. cr., $1.75@2. Pears, Bloodgood, State, ₰ bbl., $5@6; Catherine, $4.50@5. Grapes, N. C. Ives, ₰ case of 18 4-pounds boxes, $4 50@4; hot-house B. Hamburg, 50@75c.; Sweet Water, 25@35c. Blackberries, Lawton, Jersey, choice, ₰ quart, 10@12c.; poor to good, ₰ quart, 8@10c. Raspberries, Red Antwerp, 8-to-qt. cup, 5@7c.; Brandywine, thirds, 5@6c. Whortleberries, Shawangunk Mountain, ½ bu. box, $1.25@1.50; Jersey, ₰ ½ bu. box, $1@1..5; Md. & Del. ₰ qt., 8c. Currants, cherry, ₰ qt., 5@7c.; small, 2@3c.; black, 3@5c. Apricots, prime, ₰ qt., 2@25c; common, ₰ qt., 10@15c. Watermelons, Nantucket, ₰ 100, $10@25; N. C., $5@20; S. C., $20@30. Nutmeg melons, Jenny Lind, Jersey, ₰ bbl., $2@2.50; Norfolk, $1.50@2; citron, Norfolk, $1.50@1.75. Peanuts dull and very weak; Va. hand-picked, ₰ ℔., 5¾@5¾c.; extra prime, 4¾@4¾c.; good to prime, 4¾@4¾c.; common, 4c.; shelled, 5¾@5¾c.

FLOUR.—There is a good business, partly for export, and prices strong.

Latest prices are $5.50@4.50 for inferior to very fancy superfine State and Western; 4 25@4.50 for ordinary to very good extra State, odd lots and lines; $4.50 for very good to fancy do.; $4.25@4,50 for ordinary to very good shipping extra Western, and $4.50@4.75 for good to fancy shipping extra do.; inferior to very good white wheat extras, $5.25@5.75; very good to very choice do, at $5.75@6.75; red and amber winter wheat, inferior to choice trade and family, at $5.00@6.25; round hoop Ohio, $4.85@4.90; and trade and family brands of do, at $5.00@6.35; St. Louis at $5.10@5.85 for inferior to good extra; $5.85@6.75 for good to very choice; Minnesota clear, very inferior to fancy, at $4.25@6.50; Minnesota "straight," very poor to very fancy, at $5.85@7.25, and patent inferior to fancy at $6.00@8.50; unsound stock at from $2.25@5 00; city mill extra at $5.60@6.75 for very good to choice for the West Indies; do. for England, $4.25@4.65 for poor to very choice spring wheat, and $5.10@5.50 for winter wheat product; do. trade and family extras, $6.10@7.00; do. for South America, $5.75@6.00; No 2 at $2.40@3.50 for poor to very fancy, the latter an extreme.

Receipts for week, flour, bbls. 91,533; corn meal, do. 4,0.8; wheat, bush. 2,260,318; corn, do. 2,379,500. oats, do. 231.177; rye, do. 32,301; malt, do. 78,790; peas, do. 8,840.

CORN MEAL.—Sales at $2.70@3.75 for yellow Western, and $3.25 for Brandywine.

GRAIN.—There has been a brisk export demand and a fair trade otherwise, with prices higher. The exports for the week have been 1,250,000 bushels wheat, and 1,450,000 bushels corn.

Latest sales of wheat are of No. 1 white at $1 10½@1.1 ½; do., July, at $1.11; do. August, at $1.08½; do., September, at $1.07½@1 08; No. 2 white $1.05; ungraded white at $1.05; No. 2 red at $1 09½@1.10¾; do. July, at $1,09½@1.10½; do. August, at $1.08@1.08½; do., September, at $ .8½@1 08¾; do. Oct $1.19; do. steamer grade at $1.06@1 07¾ No. 3 red at $1.06½@1.06¾; ungraded red mixed at $1 07½; mixed winter at $1.05¾@1.06. No. 2 Milwaukee and hard spring at $1.07@1.09; No. 3 spring at $1. Corn at for New York No. 2, at 47¾@48½c.; do. July, at 47¾@48½c.; do., August, at 48¾@48¾c.; do., September, 48½c; New York steamer mixed at 46½c.; ungraded mixed Western at 45@48½c.; New York yellow at 50c; No. 2 white at 52¾@53¾c.; No 3 at 45½c. Oats at for 1 white at 42@42½c. No. 2 white at 38¾@39½c; No. 3 white at 35¾@36c; New York No 1 at 36½c.; New York No. 2 at 35@36½c.; do., July, quoted at 38c, bid and 36½c. asked; do., August, at 32¾c. bid and 33c. do. September at 32¾@33½c; No. 3 at 35@35½c.; ungraded white Western at 37@43c.; ungraded mixed Western at 32@37c.; 78,000 bush. No. 2 Chicago at 35¾@36½c.

HAY AND STRAW.—The arrivals are fair, but demand good and prices strong.

New hay quoted at 80c@$1.0', as to quality; shipping hay quoted at 85c.; retail lots at 90c.@$1 for medium, and $1.10@1.15 for prime and fancy qualities; clover, 60@65c. Straw at $1@1.05 for long rye, 60@65c. for short rye, and 55@60c. for oats.

HOPS.—There is very little stir to demand with prices unsettled and weak. Quotations are for

	Cents per ℔.

POULTRY AND GAME.—Receipts of dressed are liberal and as the demand is not of daily steadiness prices are weak for most lots. A few exceptional Penn. and N. J. are firm, but Western might as well be kept out of receipts for a time. Chickens sell best at the close of the week.

Turkeys, choice, small, on ice, 12@13c.; fair to good, 10@11c.; Phila., dry-picked, 14@15c.; chickens, Spring, Phila., large, 20@21c.; Phila, small, 18@19c.; State scalded, 16@17c.; Western scalded 14@16c.; Fowls, Phila., dry-picked, 14@14½c.; Jersey, dry-picked prime, 13@13½c.; scalded 12@12½c.; State, dry-picked, prime, 12@12½c.; State, scalded, 11@12c.; Western, dry-picked, prime, 11@12c.; scalded, 10@11c.; poor to fair, ——; ducks, spring, dry-picked, large, 15@16c.; small, 13@15c; State, scalded, 13@14c.; Phila., old dry-picked, 10@11c.; squabs, white, per doz $1.50@1.75; dark, $1@1.12.

Live chickens continue low; city killers have to compete with large arrivals of dressed. Sale of fowls for Cuba have helped prices for prime. Turkeys higher though only through scarcity.

Chickens, large, ₰ lb., 15c.; small, 15c.; Western & Southern 13@14c.; fowls, Jersey, 12c.; Western, 11@12c.; Southern, 11c.; roosters, 5@6c.; turkeys, mixed, Jersey, 11@12c.; Western, 10@11c.; ducks, N. J., N. Y. and Pa., ₰ pair, 55@75c.; Western 45@50c.; Southern, 40@45c.; geese, Jersey, $1.50@1.75c.; N. Y. & Pa. $1.25@1.50; Western, mixed, $1@1.25; Southern, 87c.@$1.12; pigeons, 20@35c.

A few pigeons comprise the game offering; flight, 75c.@$1, stall fed $1.50@1.75, woodcock not quotable until after Aug. 1.

PROVISIONS—Hog products have been more active and prices advancing.

Mess pork quoted at $14 10 for July; $14.10@14 15 for August, $14.20@14.25 for September, and $14.25@14.30 for October. Bacon at 7½c. for long clear and 7¾c. for short clear. Beef—Extra India mess quoted at $16 for city; $10 for extra mess, and $9 50 for plain mess, $10.50@11 for packet, and $— for family mess. Beef hams at $23.50@23. Lard—Western steam at 7.30c.; for spot lots 7.25@7.27½c. for August deliveries; 7.37½c. for September, and 7.45 for October. Stearine is nominaly for Western. Tallow at 6 7-16c. for prime.

Receipts for week, beef, 480 pkgs.; pork, 2,550 bbls.; cut meats 16,000 pkgs.; lard, 6,800 pkgs.

SEED—Timothy is quiet; quoted at $2.75@2.90. Clover in light demand, quoted at 7@7½c, for Western.

TOBACCO—Prices unchanged.

WOOL.—The market is still very quiet and without new features. Quotations are essentially as last week.

LIVE STOCK MARKETS

NEW YORK, Saturday, July 24, 1880.

BEEVES—Receipts for week 13,007 head; do last week 14,616 do. At Sixtieth Street the trade was slow and dragging, and the sales were a fraction under Wednesday's rates. There was a sharp demand for prime shipping cattle at the Jersey City yards, and previous prices were fully maintained; decent to good butcher's steers were a fraction higher no higher prices were paid, but buyers got a poorer grade of cattle for the same figure they paid on Wednesday. Fair Cherokees and Texans sold readily at ½c. advance from previous rates, the best lots going at 8½c., to dress 55 pounds. The bulk of the business was at 8@8¼c., to dress 55 ℔s., for Texans and Cherokees; 8¼@9½c., to dress 55@56 ℔s., for common to fair native steers; 9½@9¾c. to dress 56@57 ℔s., for good to choice do.; small State bulls sold at 2½c.

COWS AND CALVES.—Receipts are light, but prices are not aided by the fact. Quotations are $30@50 for the style of State arriving, with sales within the range.

VEAL CALVES.—The market has ruled quiet, and to clear up there has been some giving away in prices.

Live calves, N. J. and Bucks Co., choice, 6½c.; prime, 5½@6c.; State choice, 6@6½c.; State, prime, 5¾@6c.; do, fair to good, 5@5¼c.; poor, 3@4c.; heavy, good to prime, 5@5¾c.; buttermilk, 2½@3c.; grass, 2c.

SHEEP AND LAMBS—Receipts for week, 28,206 head; do last week 35,379 do. Heavy shipping sheep were in fair demand and steady; butchers sheep were weak and slightly favored the buyer; lambs opened active and firm, but closed weak and about ½c. off. Sales of sheep were at 4@5c; extra Indiana wethers 144 ℔ average, export alive at 5¾c. of Southern and Western lambs at 5½@7¼c.; of Penn, State and Canada at 6@7¼c., and of Jersey at 7@7½c.

SWINE.—Receipts for week, 22,725 head; do last week 20,579 do. No quotations for live; receipts go to packers. City dressed 5 3-16@5¾c.

TALK ON BOTANY.—NO. 5.

UNCLE MARK.

Buds.

In our last talk we spoke of nodes, internodes and phytons. We found that the places where the leaves appear on the stem are called nodes; that the smooth pieces of stem between the nodes are called internodes; that the internode with its node on top, has received the somewhat technical name of phyton, and that all plants thus, in reality, are made up of phytons, one placed above another. There is still something more about the stem of which nothing has been said so far, and from the heading you have already guessed that I mean the buds.

FIG. 246.

FIG. 247.

Of course, you all know what a bud is, you have seen buds many and many a time, and see them every day. In the spring of the year, particularly, do the buds on all trees and shrubs engage our attention. They are "buds of promise" and we anxiously watch them day after day as they gradually swell to larger proportions and at last develop green leaves or flowers. There are

Two Kinds of Buds,

leaf-buds and flower-buds. The leaf-bud always develops into a stem or branch, and the flower-bud gives birth to a flower. A bud, then, may be defined to be an undeveloped stem. "But," I hear some of you say, "a flower is not a stem, hence your definition is not a good one. It does not include flower-buds." I will say to those who make this objection, that botanically, a flower may be considered as corresponding to a stem, the parts of the flower answering to leaves.

In some respects a bud is very similar to a seed. Like the seed, the bud may remain dormant for a period of time, and then under favorable conditions spring into activity. The bud contains a rudimentary stem, which is also the case with the seed. The seed when put in the ground, will develop into a plant, and so also may the buds of many plants be planted, especially if a little wood adheres to them, as with cuttings, or they may be transferred from one tree to another, of which budding is an example. The seed carries with it certain characteristics which will appear in the plant grown from it, as to the character of the fruit, for instance. The bud has also fixed traits which will reappear in the plant developed from it. The parallel might be lengthened, but this is enough to show how very similar a bud and a seed are in their functions. There are, however, also dissimilarities, and conspicuous among these stands that of origin. The seed is the result of a flower. It is formed by the most intricate process and by the most delicate organs of the plant, while the bud is merely an outgrowth of the stem, caused by the accumulation of sap. No plant can form seed without going through the process of flowering and fertilization, while in many plants you can cause buds to appear almost anywhere on the stem, at will. Buds have been classified according to the position they occupy upon the stem. We will first speak of the

Terminal Bud,

This bud is always found at the end of a stem or branch, and in many plants it is much larger than the other buds and therefore very conspicuous. Figure 247 represents a twig of a horse-chestnut after the leaves are fallen, with the terminal bud at the end. Many palms and other plants do not branch at all, but the stem is continually developed from a terminal bud. It has received its name from its position at the terminus or end of the stem. In the axil of the leaf, or the corner formed by the stem and leaf-stalk, and just above the latter, is always found one or more buds. These buds from their position are called

Axillary Buds.

In the twig of the horse-chestnut, figure 247, these axillary buds are also shown just above the scar that marks where the leaf was attached. If more than one bud appears in the axil of a leaf, the extra ones are called

Accessory Buds.

They are often found on the cherry, honeysuckle, maple and others. On the grapevine we very often find a small accessory bud on each side of the true axillary bud. Again, in other plants their position is not so regular, but they may appear above the axil as in figure 246, where l is the leaf-scar, e the proper axillary bud and a, a, large accessory buds.

Bud-Scales.

Some buds are *naked*, that is, they are not protected by a special envelope, and others are provided with scales for their protection, in which case they are called *scaly* buds. Bud-scales are considered to be a modification of the leaves, and their arrangement correspond with that of the leaves. As a further protection, a sticky, resinous substance is sometimes exuded from the bud, as seen in the horse-chestnut. Like the leaves, the bud-scales leave scars on the stem when they fall off in the Spring, and these scars mark the starting point of the new growth, and thus enables the observer to trace the growth back for several years; the maple, poplar, and beech are examples.

More might be said about buds, but this lesson is long enough and I will close.

THE FOURTH OF JULY AS A MOVABLE FEAST.

THERE is nothing certain in this world but uncertainty, that's a sure thing. Ever since I was a boy this great holiday has been erratic and illusionary. In my early days it never came soon enough, and always went off too soon. It came on a Monday, a Tuesday, a Wednesday, a Thursday, and then torpedo like jumped over to Saturday. Then it often comes on Sunday. What a day for the 4th! and what an idea! It also comes on the third of the month, and on the fifth, but that I can account for, it's an endeavor to make up for coming on Sunday. If we add together the third and the fifth, we have eight, which divided by two, gives us two fourths in one year, besides the one on Sunday which makes three-quarters of the 4th of July at once. (For the edification of my young readers I may incidently note that this is an example of metaphysics, a very abstruse branch of the fine arts.)

One quarter of the population of this State of Nebraska, in this year of grace, 1880, celebrated the day on the third, three-quarters celebrated it on the fifth, and the whole population (i. e. all the little boys celebrated it on the 4th. Sunday, which being always a broken day here, was this year nearly ruined, as there was nothing but cracks and crackers to be seen and heard all day (the boys were all hid in the smoke). The latest news received here through the kindness of the RURAL NEW-YORKER, has satisfied our boys that there is a better place than "Home, Sweet Home," as that paper solemnly informs us that in New York, the 4th of July came on the 10th and "stopped the paper," it must have been a "whopper," (I mean the 4th of July *there* was a whopper) or it must have got crossways. Our RURAL came three days after time, and by the application of the aforesaid metaphysics to the subject, we are satisfied that in New York this year, the great and glorious day occurred there on the 3d, 4th, 5th, 7th and 10th, and now all the boys here want to know what the fare to New York is by the fast line, and the price of crackers (and cheese of course). There will certainly be an eruption of our juvenile Goths and Vandals upon your city next year.

Dodge Co., Nebraska. S. RUFUS MASON.

LETTERS FROM THE COUSINS.

Electric Lights, or Lights from Shadow-Land.

DEAR UNCLE MARK:—I am a brother of Will-o-the Wisp, and we all enjoy his letters so much. We are a large family and all "children of light," though not related to the sun and the moon. Our father is Electricity. He is called Thunder and Lightning, because he makes a noise when a cloud rises in the horizon of his domestic peace. Our mother is Phosphora and she sheds a gentle light on all in dark places. I have a sister, Mollusca (who shines upon the face of dark waters), we call her Mollie for short. Another sister, Aurora-Bore-Alice, is like our father, Electricity. My oldest brother, Ignis Fatuus, has a boy who is called Fire Fly. My brother, Jack-a-Lantern, is also a Jack-of-all-trades. Their interest is excited by Will's letters, and I think you will hear from each of them. I think I can account for Will's silence. Here is a letter from his little girl to my mother.

"My own dear Ganma:—We is just got a new baby. One big Injun man lost it an my papa found it, may be. My papa says it is a papoose. I wis its ole squaw mammy wood tum and get it, so mammy cood get time to comb my hair; it looks like a wab's nest and my face is just like I'd took dinner wid de little pigs. My mammy does not love me much now, and I must be very still all de time. My papa is not got time to rite. I love yoo, Ganma, and twied about yoor hurt arm. I made yoo a soft cooshion to sit on when yoo cums from Weginny. My mamma say what must she call de baby; its a little girl wid black hair an eyes, and wid hans and little nose and feets. Good-bye, Ganma. JANNETA."

Will some of the RURAL cousins please suggest a name for the new baby? Will-o-the-Wisp has wandered far, but I hope he has not led any astray by his mysterious light in the swamps of Lopez. I wish to join the Horticultural Club. I have a water-melon patch and work in the garden when I have time. My mother was tying up her grape-vines and fell and broke her arm. It has been nine weeks since, and she has no use of it yet, and cannot attend to her garden. I clerk in my father's store and am trying to learn to do everything. I have been painting some on the house. Men passing say I paint very well. I am the youngest child of this family, and my sister calls me "Baby," but I am fourteen years old and fill the place of a man. Jack can telegraph, engineer, tan leather, clerk, hoe corn and make batter cakes and coffee. He is two years older than I. But this is enough about "our folks." FOX FIRE.

Big Spring Depot, Va.

DEAR UNCLE MARK:—I wish to join the Horticultural Club. Uncle Fox says he is going to join. Aunt Mollie says I like flowers better than any little boy she ever saw. I stay with her now, but my home is at Lafayette. She has so many flowers. I gather seeds and put them in match boxes and write the name on the outside. Aunt Mollie cuts the seed stocks off before the balls burst and lays them on a newspaper. When the balls open she takes the bunch of stocks up in her hand, knocks on them gently and the seed all rattle down clean without any trash in them. She opens envelopes on the end always and saves her paper wrappers, so she has lots of bags to put seed in. I do that way, too. I gather morning-glories every morning and run a stem through them till they look like a lady dressed up with white skirts with blue and pink ruffles and red overskirt. I stick a snow-drop or pea on for a head. Hollyhocks make pretty girls to play "Fourth of July" with. My cousin, "Glow Worn," is here to play with me. We have so much fun with the rabbits. When old "Mollie Cotton Tail" leaves her nest we get out the little sleek fellows and try to feed them, but they start off walking with their two hind legs at once, just like a see-saw. There are six with their eyes just open. There are so many swallows here we call it "Swallow's Home." Glow Worm and I pick up the young birds and feed them. We set them on a twig, get a worm, and make a circle quickly over the bird with the hand, and it opens its mouth and we put in the worm. FIRE FLY.

Reed Island, Va.

DEAR UNCLE MARK:—I have been thinking for some time of writing and thanking you for those nice seeds. They are up and some of them budded to bloom. The okra looks nice; I never raised any before. What has become of all the cousins? It can't be they have forgotten old friends, or have they adopted new *nom de plumes*, so that we may not recognize them? We were quite disappointed in not getting seed of the "Dutchman's pipe." Can they be bought anywhere? The magnolia and iris seed are not up yet. Is there any chance of their putting in an appearance at this late day? (Yes.) I don't think it can be very pleasant living in the city in the Summer. I know I should not like it. But I must stop scribbling, for that waste basket looms up before me, crying "beware"! Wake up, cousins, and let us know that some of you, at least, are alive. Let us overwhelm Uncle Mark with letters until he cries for quarter. Who will be the first to say amen to that?

Sheboygan Co., Wis. COUSIN AMY.

UNCLE MARK:—I have been reading the letters from the boys and girls for some time and I have been thinking about writing, but time was not spared me and it was neglected. Papa has been taking your paper for about five years, and I think it is time to write. I would like to know what has become of Dew Drop and all those fine young ladies. I wish they would write and we would have a fine time again. Well, I will quit for this time. Hoping to see this printed I remain,

Yours respectfully, E. K. AUSTIN.

THE SOUL'S FAREWELL.

BY LOUISA LORNE.

FAREWELL to thee, frail form of dust!
The day hath come that part we must;
This spirit that hath dwelt with thee
Is weary now and would be free.

A reckless longing now is mine
To seek my Maker's holy shrine;
And yet I grieve to leave thee here,
So cold and lonely on thy bier!

Was it a sigh that shook the breast
Wherein I oft have lain at rest?
Or was it but thy shroud so white
That fluttered in the faint twilight?

Let not these parting words be met
With aught like sighs or still regret;
For, lovely one; 'tis best for thee
This wayward spirit should be free.

Yet, silent form, thou art too bright
To doom to everlasting night;
And still the soul that lit those eyes!
Must hasten far beyond the skies.

And leave thee lone but not unwept—
For I have o'er thee vigil kept,
And soothed thee to a death-like sleep,
So thou shouldst never wake to weep.

And oft at even I'll retrace
My pathway but to kiss thy face
And sing to thee—perchance to pray
Above thy grave, beloved clay.

But now, farewell! The pale moonlight
Gleams forth to aid my upward flight;
And tiny stars in silence rise
To form my path to Paradise.

May, 1880.

THE BEAUTY OF THE DEAD SEA.

THE Dead Sea is generally supposed to be the picture of desolation and death. Travelers however, state that there is a certain strange and melancholy beauty about it which impresses the one who beholds it.

Hodder, in his volume "On Holy Ground," says: "Before us, stretched the long chain of the mountains of Moab, like a huge blue wall, and beneath it lay that great and melancholy marvel, the Dead Sea. It was a view which I had not expected, never having associated the idea of beauty with the Dead Sea, or the wilderness of Judea, but from the hight on which we were, the view was very fine.

We noticed as we descended to the plain what so many travelers have observed and described, resembling an exhalation like a white cloud rising from the sea, in exquisite relief with the dark blue hills of Moab behind it.

At length we reached the plain, and making our way through a strange jungle of curious vegetation, we came to the shore of the lake. Here again I was especially disappointed, and looked in vain for the awful gloom and deathliness I had expected to find. The shore was not strewn with masses of dead and whitened trees, the water looked bewitchingly bright and beautiful, and reflected every minute detail of the surroundings, as in a burnished mirror. But this was the first impression. After an hour or so upon its shore I experienced its awful stillness, and felt the absence of life. I cannot define the solitude of the place. There is something which you can *feel* more than you can see."—Biblical Review.

CHRISTIAN COURTESY.

THE Christian precept, "Be courteous," was not however enjoined by the accomplished Paul. In the language of another, "it fell from the pen of an illiterate man, bred to the roughest of all employments. It was Peter, the inspired fisherman that said; 'Be courteous,' to imitate that the religion which he had learned from the meek and lowly Jesus, was able to soften the keenest, and cool the hottest temper, and even give gentleness to one trained amongst winds and waves."

But the courteous and scholarly Paul, in addressing the "Saints and faithful brethern" of Colosse, exhorts: "Let your speech be alway with grace, seasoned with salt, that ye may know how ye ought to answer every man," which simplified, means, "Be sincerely courteous." And if I mistake not, the apostle James, gives us a beautiful definition of courtesy, in the following words:

"The wisdom that is from above, is first pure, then peaceable, gentle, and easy to be entreated, full of mercy and good fruits, without partiality and without hypocrisy," Jas. 3:17. And Christ himself counsels the burdened in heart, saying: "Take my yoke upon you, for I am meek and lowly in heart," Matt. 11:29. There are many other precepts which inculcate some essentials of this grace, such as gentleness, meekness, love, forbearance, preference of another to self, &c.

The importance of Christian courtesy is therefore indisputable. It cannot be neglected without sin. Christians, especially, are exhorted to "think on whatever is of good report," to "adorn the doctrine of Christ in all things."—The Central Baptist.

CHOOSE THE RIGHT.—The greatest man is he who chooses right with the most invincible resolution; who resists the sorest temptations from within and without; who bears the heaviest burdens cheerfully; who is calmest in storms, and most fearless under menaces and frowns; whose reliance on truth, on virtue, and on heaven, is most unfaltering.

FLOWERS never emit so sweet and strong a fragrance as before a storm. Beauteous soul! when the storm approaches thee, be as fragrant as a sweet-smelling flower.—Richter.

LET us be sure that our delight excludes not the presence of God; we may please ourselves so long as we do not displease him.—Thomas Adams.

PERSONAL ITEMS.

Cardinal Nina, the Papal Secretary of State has resigned.

Burdeste, the Burlington Hawkeye man, has gone to live permanently at Nantucket, Mass.

The attaches of the English Legation who are at Newport have information that Prince Leopold is seriously ill in Canada.

Jennie, daughter of the late John McGraw of Ithaca, N. Y., a girl worth $4,000,000 or $5,000,000, was married to Prof. Willard Fiske of Cornell University last week at Minister White's Berlin residence.

Secretary Evarts's professional income is estimated at from $74,000 to $100,000 a year (it has been as great as $150,000) but he is not, in the New York sense, rich, owing to his liberal mode of living and his large family.

Prince Jerome Napoleon's son Victor, was eighteen years of age on Sunday, and an anti-Jeromist organ of Paris remarks that he is therefore dynastically of age to assume the succession bequeathed to him by the Prince Imperial.

There are said to be no fewer than eighteen members of the Vanderbilt family now staying at Hotel Bristol, Paris, and even the suite of apartments usually reserved for the Prince of Wales has been given up to the American millionaire.

Governor Simpson, of South Carolina, will vacate his office to take that of Chief Justice on August 1. Mr. Jeter president of the Senate, will become Governor. South Carolina will then have had three Governors in less than two years—Hampton, who resigned to go to the Senate, Simpson and Jeter.

Mr. Jos. H. Denson, Clerk and Recorder of Sevier County, Arkansas, says in a recent letter: "I have forgotten whether I wrote you concerning *the almost marvelous effect* the Compound Oxygen Treatment had on me. I was suffering from Bronchitis, and had been for three months—had almost despaired of recovery—when I commenced the Treatment. I could feel a marked change on the first night I took it. I had not enjoyed a good night's rest for something over three months; but on the night I first took the Treatment I slept splendidly, and afterwards continued to improve rapidly until I was cured. If you see fit you can use this for the benefit of sufferers." Full information about this new Treatment for Chronic Diseases, sent free by Drs. Starkey & Palen, 1109 and 1111 Girard St. Phila., Pa.

Miscellaneous.

KIDNEY-WORT

PERMANENTLY CURES
KIDNEY DISEASES, LIVER COMPLAINTS, Constipation and Piles.

Dr. R. H. Clark, South Hero, Vt., says, "In cases of Kidney Troubles it has acted like a charm. It has cured many very bad cases of Piles, and has never failed to act efficiently."

Nelson Fairchild, of St. Albans, Vt., says, "It is of priceless value. After sixteen years of great suffering from Piles and Costiveness it completely cured me."

C. S. Hogabon, of Berkshire, says, "One package has done wonders for me in completely curing a severe Liver and Kidney Complaint."

IT HAS WONDERFUL POWER. WHY?

Because it Acts on the LIVER, the BOWELS and the KIDNEYS at the same time.

Because it cleanses the system of the poisonous humors that develope in Kidney and Urinary diseases, Biliousness, Jaundice, Constipation, Piles, or in Rheumatism, Neuralgia and nervous disorders.

KIDNEY-WORT is a dry vegetable compound and can be sent by mail prepaid.

One package will make six qts of medicine.

TRY IT NOW!

GRAIN DRILL,
ALSO
THE NEW BUCKEYE
Combined Grain and Fertilizer
DRILL,
AS IMPROVED FOR 1880.

Over 7,000 of these new Drills were sold and used in the United States last season, and were pronounced by all to be the *most perfect Seeding Machines* in the country. No Grain Drill ever made gave such *universal satisfaction*. It is the best force-feed in the market. Our Fertilizer Sower has a positive force-feed and has no equal in this country. Be sure and send for our new Illustrated circular, giving illustrations and descriptions of the improvements. Address
P. P. MAST & CO.,
Springfield, Ohio.

Fit all drill boots, run level, cut *flat bottom* furrows, cover with *mellow* soil, and instead of *crowding the seed* into narrow rows but *one inch in width*, scatter it 3¼, 4, and 5 inches; the plants thus standing *wider* apart, have more ROOM TO STOOL, derive more nourishment from the soil, become more vigorous, and produce better developed average heads.
Send for Illustrated Circular with Testimonials to
As ye sow, so shall ye reap. J. A. JONES, Wilmington, Del.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

Humorous.

REMINISCENCES OF SUMMER.

I'm sitting on the stile, Mary;
I sob, and smile, and sneeze;
'Twill only be a while, Mary,
I think until I freeze;
The ulster coat I used to wear
Has vanished like a dream;
We ate it up, I do declare,
In chocolate ice-cream.—Burdette.

"I RISE for information," said a member of a legislative body. 'I am very glad to hear it," said a bystander, "no man needs it more."

"KIND words can never die." A man never realizes this fact so fully as when he is sued for breach of promise, and has his love letters printed.

"MERCY!" exclaimed an old lady upon first seeing an engraving of the passage of the Red Sea by the children of Israel, "mercy! what a family the man had!"—Boston Transcript.

HERE is a fair hit at the singers. "Mamma," asked a little girl, "why is it they sing in church, 'We're going home to dine no more,' and then go right home and dine?"—Congregationalist.

"THINK twice before you speak once." That is a good enough rule for some people; but there are folks who can think of so much meaner things to say the second time of trying that we prefer to hear their first inspiration on the subject.

A STRANGER, passing a church-yard and seeing a hearse standing hard-by, inquired who was dead. The sexton informed him. "What complaint?" asked the inquisitive one. Said the old man. "There is no complaint; every body is satisfied."

OLD Mrs Skittleworth doesn't know why people *will* will make counterfeit money. She says she tried to pass a bad half-dollar a dozen times the other day, but nobody would have it, and she thinks it is a waste of time to make such stuff.

AN old lady visiting the Antiquarian Museum in Edinburgh the other day, on inspecting the old weapons very earnestly, and failing to find what she was apparently looking for, asked a visitor if he could tell her whereabouts they kept the Axe of the Apostles.

THIS notice was once fixed upon a church door in Hertfordshire, and read in the church: "This is to give notice that no person is to be *buried* in this churchyard but those *living* in in the parish; and those who *wish to be buried* are desired to apply to me. Ephraim Grubb, Parish Clerk."

AN old lady from New Bedford visited Boston recently for the first time, and, while viewing the attractions of the public garden, was pointed out the bronze statute of Charles Sumner. "Well, I declare," the old lady remarked, "I never knew Sumner was a colored man before."

AN exchange tells of a man who had sixty-five dollars stolen from him, and who soon after received twenty-five dollars with the following note: "I stoled your money. Remorse naws at my conshens, and I send you some of it back. When remorse naws again, I'll send you some more."

"GOODS at half-price," said the sign. "How much is that tea pot?" asked the old lady who had been attracted by the announcement. "Fifty cents, mum." "I guess I'll take it, then," she said, throwing down a quarter. The dealer let her have the teapot, but took in his sign before another customer could come in.—Boston Transcript.

A LITTLE four-year-old girl was having her picture taken. The artist said, "You must keep your mouth shut, my dear, and your eyes open," as the little one showed a decided inclination to open her mouth and close her eyes. But on being instructed, she braced up, and after a few minutes, wonderingly asked:—"Now what shall I do with my nose?"

AN Irishman once saw a clock which showed the Greenwich and Dublin time, and he saw that the Dublin time was twenty minutes behind that of Greenwich, and he asked how that was, and it was explained to him that Dublin being to the west of the first meridian, must have its time later than that of Greenwich. "Then, be the powers!" says Pat, "there's another injustice to onld Ireland!"

The Great Drawback

Of most remedies is their lack of thoroughness. They do not remove the original cause of the symptoms, although they may temporarily relieve these. The marked superiority of Hostetter's Stomach Bitters to rival medicines advertised or asserted to produce kindred results is exhibited in the decisiveness and permanency of its effects, as contrasted with the instability and fleeting character of theirs. A lack of digestive and assimilative power is attended by many symptoms often erroneously ascribed to other causes, and which it is impossible to relieve with a mere placebo. Radical means are the only effectual ones, nay, more, the use of such as are not so in medication, is usually irrational and productive of more ultimate harm than present good. To quell pain, to allay nervous excitement, to relieve despondency, the rebellious organs must be brought into subjection, and their activity insured by toning and regulating them.

BUSINESS IS BUSINESS.

Minister's Wife—"Oh, Mr. Dossett, we have not seen your assistant, who has such a very nice tenor voice, in the choir lately."

Country Grocer—"No, ma'am; I've parted with him owing to the minister and other gentlemen getting their supplies from stores in the city."

$2.00 PER YEAR.

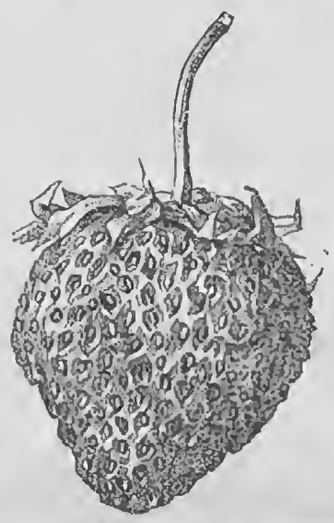
[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Horticultural.

NOTES FROM THE RURAL GROUNDS.

Strawberry Notes.

GEN. SHERMAN.—This was sent to us on trial in April of the present year by Mr. E. P. Roe. The plants have made a healthy growth. The berry is bright red, of medium size and good quality.



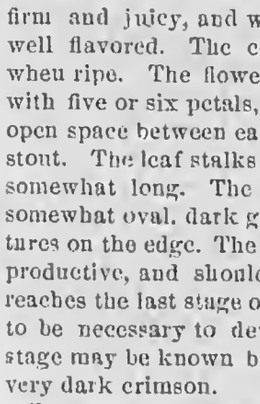
PRIMO—FIG. 248.

WINDSOR CHIEF (J. T. Lovett) is the same as Champion, so that the former name should be rejected. The cut of this, as of the others, is of a medium-size berry. It is obtusely conical, but the larger berries are irregular in shape and somewhat round. The flesh is moderately firm and juicy, and when ripe sprightly and well flavored. The color is a dark crimson when ripe. The flowers are pistillate, small, with five or six petals, but mostly six, with an open space between each. The fruit stalk is stout. The leaf stalks are of medium size, and somewhat long. The leaflets are large and somewhat oval, dark green, with coarse serratures on the edge. The Windsor is exceedingly productive, and should not be picked till it reaches the last stage of ripening, which seems to be necessary to develop its quality. This stage may be known by the berry becoming a very dark crimson.

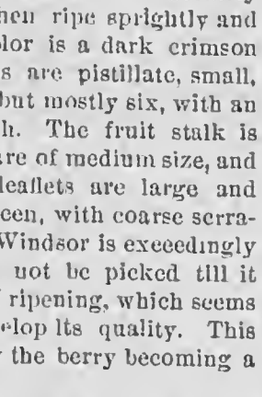
CINDERELLA.—From all we can learn of this berry it varies in different situations, being strong and prolific in some, weakly and unfruitful in others. Ours were ripe June 7th, the past season. The plants are fairly strong, quite prolific and the quality good.

GLENDALE. — Very vigorous plants, large leaves, color bright red, quality sour. Late and prolific.

PRESIDENT LINCOLN.—This has done better with us than ever before. It has ripened through an unusually long season; the quality is excellent, the berry large.



WINDSOR CHIEF. FIG 249.



CINDERELLA. FIG. 250.

SHARPLESS.—We presented engravings of this berry two years ago. This year, more than heretofore, we find the shape more as in fig. 251, a profile of which is also shown. We have praised this berry from the first, and extended tests have proven that the praise was well merited.

Blackberries.

This has been a remarkable season for wild fruit, which has nearly equaled the cultivated sort in size and surpassed them in sweetness. The Taylor bears a berry not quite so large as the Kittatinny, ripening at the same time. But it is sweeter and very prolific.

Honeywell Peach.

Two trees of this were sent to us by the Messrs. Hance, three years ago, to be tested. They bear the present season abundantly, ripening the first fruit July 12. They are small, adhere to the stone, juicy, but nearly tasteless. Of

Raspberries,

CUTHBERT holds out the best, and is still ripening its firm, large, high-flavored berries.

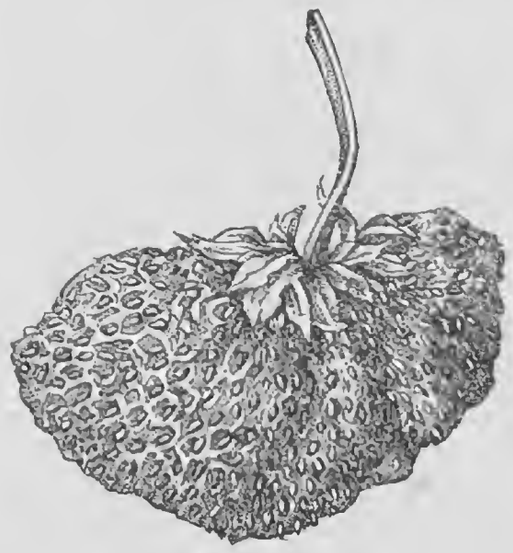
PRIDE OF THE HUDSON has ripened a few berries upon canes of this season's growth, the biennial cane being quite too tender to endure the winter.

STRAWBERRY "PRIMO" (SMITH).

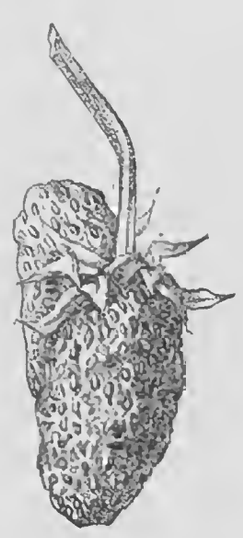
THE new strawberry Primo (Fig. 248.) was raised by Mr. Daniel Smith of Newburgh. As it has not yet been sent out, and is now described for the first time, a somewhat minute description is given, to serve the purpose of future identification. Our plants were received from Mr. Smith last September, and from these our description is taken, beginning with the berry.

The form of Primo is broadly conical, with a small neck, the larger berries becoming enlarged at the base, and more or less ribbed. The seeds are brown, and slightly sunken. The flesh is white, tender, sweet, moderately juicy, with an aromatic flavor like the wild berry. The color is a dark scarlet. So far as one season's trial may be relied on, its quality may be said to be excellent. The first berries were ripe on the 5th of June, or about the time of the Duchess, growing about twelve feet from it.

The flowers are staminate, of medium size with mostly six petals, but sometimes eight, and then overlapping; otherwise simply full. Calyx of medium size. The fruit stalk is stout, and stands well up. The leaf stalks are stout, and rather long. The leaflets are large, nearly round, deeply veined or ribbed, and of a dark green, with moderately large serratures on the edge. The plant is a robust grower.



SHARPLESS—FRONT VIEW.



SIDE VIEW—FIG. 251.

The Primo is both early and late, the first berries ripening with the Duchess and the last with the Sharpless. It has, consequently, a long season; but it must be remembered that the past season has presented many anomalies in the ripening of fruit. It is productive, and the berries are of good size, running, during the past dry season, from four to five inches in circumference, with few small ones. The accompanying portrait is from a berry of average size.

The past season has not been a favorable one for forming an opinion of a strawberry; but, judging from its performance this season, we should not hesitate to place the Primo on the list of very promising new kinds.

STRAWBERRIES.

THE season has been a very poor one for berries, owing to the extremely dry weather. During May less than one inch of rain fell, and during some of the time high and very drying winds prevailed. Plants set in April are established, and are doing well considering the dryness of the soil. We have plants that look well where the ground is so dry that bush beans are drying out, the rows being about three feet apart between the strawberry plants and beans. We generally plant in the Spring, and for garden culture and limited room the plants can be started in the same bed or rows with the onions, as these are ripe before the strawberry plants make much growth. The soil should be deep and very rich to get the best results. I don't think it possible to make land for strawberries too rich with stable manure. I use old manure if convenient, but put on coarse, if I do not have better at hand. I plant in rows about 12 inches between the plants and the rows five feet apart, tending them with hoe and plow if the garden is of sufficient size; if not, then I cultivate with hoe and spade. Always keep a strawberry patch clean, if you expect fruit. "A stitch in time saves nine," says the old proverb, and hoeing in time is the easy way to keep the garden clean. I let the runners grow, keeping them well together so as to cover all the ground with plants. I think they do best when pretty thick. This is the lazy man's way to raise a good supply of berries. Larger berries can be raised by the hill system, yet I do not care to grow them in that way—it is too much work. Cornstalk butts make a good winter covering, and so do evergreen boughs, or any brush that will ward off the wind; rye straw is best, but it costs pretty high at present. Varieties are numerous, and so many are good to best that I should not wish to be compelled to choose one or two sorts to the exclusion of the rest. Those with perfect flowers cause so much less trouble than the rest, that it does not seem to be worth while to raise any others. If we do we must plant every other row with a variety that has perfect flowers.

CRESCENT SEEDLING was the earliest berry that ripened with me this year—a pistillate variety, conical in shape, dark red in color, of medium size, very productive, ripened from May 20th to June 10th. I would not plant this kind, however.

FOREST ROSE colored by May 15th, and ripened about 25th—a good-sized, well-flavored, rather roundish, light-colored berry that birds had a good taste for. They were all ripe by June 1st—plant a good but not strong grower.

DURAND BEAUTY came next; large, conical berries that soften before they color up fairly; quality fair; all ripened within ten days. Fair to look upon, pleasant to the taste, productive; vine thrifty; promising for home use; but of no value for market.

CUMBERLAND TRIUMPH, a large cone-shaped berry, medium season; color, light scarlet, handsome. I have grown this berry at the rate of 130 bushels per acre. Valuable for home use or near market.

GREAT AMERICAN, a large conical berry of medium season; color dark scarlet; vine not very strong. I have grown this, too, at the rate of 130 bushels per acre on a small patch.

BELLE—Perhaps this is the finest berry that I have grown. It is a thrifty grower, productive of large, conical berries, that ripen nearly all at once; color bright scarlet, very solid flesh without core; rather late.

GEN. SHERMAN—FIG. 252

GLENDALE—FIG. 253

SHARPLESS, large berry of all shapes that a strawberry can well take: flavor good; size from medium to largest; productive; not solid enough for long transportation; one of the best for home use or near market.

CENTENNIAL FAVORITE, a light-colored, late berry, of medium to large size, of roundish shape, productive; vine a very good grower; fruit not very solid.

KENTUCKY, a large conical berry, generally having a light tip on the end. The fruit is borne well up from the foliage; tolerably firm, productive. Late, all had gone by June 18th; an old kind that, I think yet, as good as the best.

TRIOMPHE DE GAND, a large, firm berry that every one knows; grows fairly here where the soil is rich, and is productive of high-flavored berries.

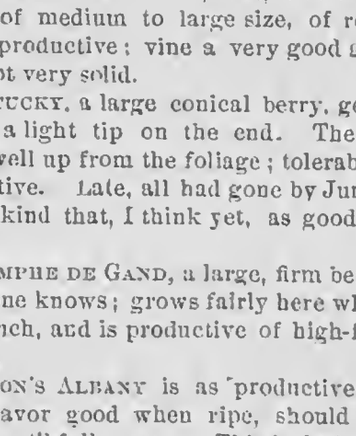
WILSON'S ALBANY is as productive as the best; flavor good when ripe, should not be picked until fully mature. This is the best shipping berry that we have, and good for home use, when allowed to get fully ripe.

CHARLES DOWNING, old and well known; good in every respect.

BOYDEN'S 30, old and well known, and still keeps its place.

MONARCH OF THE WEST, a very nice berry, has appeared to be rather unproductive.

WILDER, quality best, growth poor. I have not petted this perhaps so much as the quality of the fruit would warrant.



SENECA QUEEN—FIG. 254.

There are several old berries that are good, but the above are best with me, so far as I have experimented with them.

Titusville, N. J. IRA J. BLACKWELL.

STRAWBERRIES.

1. GEN. SHERMAN with me a feeble-growing plant, hence not productive. Berry of

large size and handsome. On account of its unproductiveness I have allowed it to run out.

SHARPLESS has sustained its high reputation the past season with one exception. This, however, is an important, hence an unfortunate one, and is that it failed in field culture to be sufficiently productive to make it so profitable as desirable.

GLENDALE—Was the most profitable berry I fruited the past unfavorable season. It stood the severe drought better than most others, yielding bountifully of large, exceedingly fine berries. For shipment to a distant market I esteem it as the most profitable variety that has yet been thoroughly tested.

WINDSOR CHIEF is still Champion — nothing more and nothing less. I have failed under the most profound scrutiny through the blossoming and fruiting season, that I was able to bring to bear upon them, to detect the slightest difference.

CINDERELLA—Last year this was decidedly unproductive, hence I neglected it this year, but it "came out strong under difficulties." The past season it was of vigorous growth although the plants were small, resembling the Jucunda and fairly productive. Berries medium to large, conical, glossy scarlet, very attractive, of superior quality and firm. It is one of the very few, I may say *only* early berry that I have found both firm and of high quality. I shall increase my plantations of it—for should it continue in future as it was the past season, it will be very valuable. I may add that I have seen it in several places throughout the State the past season, and in every instance it has produced the surprisingly good results that it did with me. J. T. LOVETT.

Strawberries.

GEN. SHERMAN.—Plant small and a slow grower. Unproductive. Foliage smooth, dark green. Calyx small, hairy, close. Fruit medium size, round, dark crimson. Flesh moderately firm, pink; flavor fair. Season medium.

SHARPLESS. — Plant very vigorous, and hardy. Has stood the drought well—better than most kinds. Berries all large to the end. I found the fruit more uniform in size this year and with less irregularity in shape. It will be a popular standard sort, having nearly all that is needed, size, beauty and quality.

GLENDALE.—If it always does as well as it has done with us this season, I shall consider it the best *late market* variety we have. I have proved it the finest berry among one hundred varieties. The plant is hardy, vigorous and productive. A strong grower. Leaflets large, strongly creased, dark green. Calyx large, hairy, recurved. Fruit medium to large, conical, slightly necked, dull, dark crimson. Flesh very firm, pink to a paler center, flavor rather acid—to my taste, poor. Season late to very late.

WINDSOR CHIEF.—Said to be a seedling of Champion. I can see no difference in either plant or fruit between them. This is no disparagement, as I regard Champion as one of the very best of our pistillate varieties and immensely productive.

CINDERELLA.—Plant a rampant and rapid grower, unproductive with us. Fruit large, conical, uniform, glossy, bright scarlet. Season medium.

SENECA QUEEN.—A variety that will some day stand in the front rank of standards. Plant a good strong grower with a tendency to form stools. Immensely productive. Fruit large to very large, round, uniform, very dark crimson. Flesh red to pale center, moderately firm; flavor only fair. Season early.

H. G. CORNEY.

The Gregg Raspberry.

THE Gregg raspberry is destined to take a high rank as a market berry among raspberry growers, certain to supersede all other varieties of the Black-cap family. Having had the berry for years, and being fully convinced of its superior merits, I did much to introduce it to the public, therefore take great pride in recording the fact that I am receiving many unsolicited letters from gentlemen in different parts of the country (even from Canada), all praising this raspberry in the highest terms for its many good qualities, some saying that enough had not been said in its praise.

Having acres of them, some in full bearing, many of the readers of the RURAL NEW-YORKER interested in the berry, desire (judging from the many letters I receive) to know how they behaved for me this season. My answer is "Splendidly, in quantity, quality, and the prices for which they were sold." I have about 13 acres of them, about six acres in full bearing, four acres bearing a partial crop, and three acres of new plantation. The entire crop was sold to Wm. Kiefaher and Bro., of this city, they furnishing packages and paying, on an average, five dollars per stand (two bushels), or one dollar per stand in excess of the price given for Mammoth Clusters. The total amount I realized was nearly 2,000 dollars. Be it remembered that this is a great berry region, where prices rule low. Those in full bearing averaged not less than 100 bushels per acre. Kiefaher Bros. told me that they never handled berries that gave such general satisfaction; there was no complaint from any one except that they did not get enough of them.

The Gregg is a strong grower, requiring no tying up to stakes or wire, for support, if pinched back at the proper time (when about two feet high), therefore they can be grown very cheaply. N. OHMER.

Dayton, O.

Improvement in Early Peas.

DEAR RURAL:—Your remarks, in "Brevities," upon improvements in earliness in garden products are in the main unfortunately correct. But while it *may* be true that the Philadelphia is still the earliest of the yellow class of peas (it is not so here), in the class of green wrinkled peas you surely have not forgotten the gain so rapidly made by McLean with his Advancer, and then with his Little Gem; while still more recently Mr. Arnold's American Wonder has easily "spurted" up along side of the earliest of the other class. These are notable and most important gains, for the yellow class which until recently so greatly led in earliness, are vastly inferior in table quality to the green wrinkled peas, of which the excellent but altogether too late Champion of England was so long the type. Let us at least give credit where credit is due.

Albany Co., Vt. T. H HOSKINS, M. D.

[We tested the Wonder the first season it was introduced and picked from it the same day as from Little Gem, from which it does not materially differ as we remember. — EDS.]

RURALISMS.

I SEE in front of some of the seed stores a placard as follows: "Potted strawberry plants put out now will produce a full crop next Spring." The same announcement is made in some circulars. Many of those who make it know better, or, at least, ought to. It is very misleading especially to those who are not "well up" in strawberry culture. There is a certain advantage in the early planting of *good* pot-grown plants; but that is no reason at all for misstatements. Good pot plants, put out in August and September, will usually produce about as much fruit as runners put out in the Spring will produce the following Spring; and that is a considerable gain, as it leaves room for an intermediate crop of another kind. That is the most that can be said of pot-grown plants, and it is a good deal. But no strawberry does its best when a year old. Very few kinds, in fact, give their greatest yield and best fruit till they are two or three years old. To those, however, who follow the matted system it makes but little difference, for they never see a strawberry in its best condition. They have something to learn, if they only knew it. Let me say briefly to the readers of the RURAL, that a *poor* pot-grown plant is worth less than a well-grown runner put out at any time. Get good pot plants if you would get the worth of your money. There are men who grow such, and pack them carefully; and there are others who do not.

I HAVE been about among the grapes lately, and everywhere the prospect for a full crop is very encouraging. As the sale of grapes in New York exceeds perhaps that of any other domestic fruit, the news will be gratifying to everybody. I must add, however, that the grape crop is never assured until the berries begin to color.

I AM pleased to learn that the American Institute will this year open a department for the encouragement of "Amateur Art Work." This is a move in the right direction that should have been made years ago. It is proposed to admit without charge the exhibits of apprentices and amateurs in all branches of mechanical, industrial and decorative art, subject, of course, to the approval of a committee appointed for the purpose. The ground covered will include painting, drawing, fancy work, embroidery, wood carving, sawing, etc. Full particulars may be learned at the Institute, Room 22, Cooper Union, New York.

A correspondent (p. 426), in an interesting letter from Tryon Valley, Lynn Co., N. C., says: "It will be seen in the agricultural reports of the United States for 1879, that the object of cultivating grapes under glass is to get clear of the moisture in the atmosphere." There is a mistake here. If a statement of that kind is made in the reports alluded to, somebody has been trying to make shoes who is not a shoemaker. The shoe is on the wrong foot. It is just the other way. It is the command of heat and moisture under glass which enables us to grow the foreign grape with so much success. I say this as the result of a long experience, and I have never heard of anything different from any grower of grapes under glass. This statement takes me by surprise. I have grown foreign grapes in a dry atmosphere under glass, (and have some so growing now,) but the result has always been unsatisfactory, and a vexation from beginning to end. There is neither pleasure nor profit in it.

I have no doubt, however, that your correspondent can grow the foreign grape in the open air on that famous "Thermal Belt," and make a fine wine. The foreign grape is hardy enough, even in the latitude of New York. The trouble is not hardiness or the want of it, but *mildew*, which has hitherto defeated all attempts to grow the foreign vine in this vicinity in the open air, except here and there a vine in a favored locality, and in such a locality I have seen the Black Hamburgh more than forty years old bearing fair crops of fruit. The vines start well in the Spring, and set their fruit, but just so soon as our dry, hot weather sets in, mildew attacks both foliage and fruit, and that ends it. I would suggest to your correspondent that he try the Black Hamburgh, Esperione, (if he can get it) Riessling, Traminer, and others of that kind; and let him on receipt of the vines, wash both roots and canes with soap-suds.

I have noticed many times the Japan Climbing Fern (Lygodium scandens), twines to both the right and the left. I have just been looking at it, and find two shoots twining in opposite directions on the same string. It looks singular. I think I have seen the same thing in some other twining plant. Have others noticed it?

Last Spring three sets of new coleus were sent out, comprising forty or more so-called different kinds. The greater part of them are of the Multicolor type. There are some that are very pretty, but they are nearly all much too delicate to be of any use out-of-doors, and many of them are of a very changeable character. Many of them, too, are so much alike that it would require a remarkable microscope to discover any difference in them. (Hiawatha and Parroquet, for example,) and it seems almost like a fraud to offer them as different kinds. All the coleus now in cultivation could with advantage be reduced to a dozen kinds or less, and old Verschaffeltii (as the RURAL has more than once intimated) would still be the best of them. HORTICOLA.

JOTTINGS.

"HORTICOLA."—I am glad to welcome Horticola back to the field of horticultural literature in the columns of the RURAL. He wields the pen as gracefully, pleasantly and interestingly as of yore, and with apparent old-time vigor. May he long continue so to do. Knowing as I do that he has keen perception combined with good judgment and a mind of his own, I am assured he will

"Nothing extenuate, or set down ought in malice,"

but cautiously and truthfully speak of things as he finds them, commending nothing except he firmly believes it deserving. A life long horticulturist, a close, careful and extensive observer, his notes cannot fail to be of interest to RURAL readers.

THE BEST CONTRIVANCE TO KEEP BIRDS FROM THE STRAWBERRIES that I have ever found is to hide the berries under the foliage provided by nature. In beds under the "let-'em-run" system, with plenty of foliage, the birds take very few, except on the outer edges. In the hill system the stools should be so close that the foliage meets each way; the birds would then confine their invasions chiefly to the paths; they are rather cautious about getting in out of sight for fear of being surprised.

HORTICOLA'S mention of an old-fashioned garden awakens in me memories that go back to childhood's happy hours, to the garden long since passed away where we took our first lesson in horticulture, where the "pinies," "marigolds," "sweet williams," "johnny jump-ups," and "morning glories" comprised our floral treasures—gone, all gone—and our assistants and companions are scattered far and wide. Ah! who as he contemplates those childhood days does not sigh "and wish he were a child again." Yes, in our thirst for the new, let us not forget to retain a place for a few of the old friends of our infancy.

THE DROUGHT DOES SOME GOOD.—I am inclined to the belief that the drought, severe as it has been, was a benefit in some respects; for instance, our apples, plums, peaches and cherries are much fairer than usual. Of the latter we have had bushels, smooth, fair, and of the best quality. I have not seen a dozen wormy ones this season, from which I infer that the drought in some way has materially lessened our curculio crop. It has been a wonder to me how our cherries and strawberries could develop as well as they did with such a high and dry temperature. Cherries were a daily diet for over a month. K. I. T.

[Anything from the pen of the above writer would be welcome at any time. We wish to say that we welcome at any and all times short, condensed notes (of which the above may be taken as samples as to length) from any of our contributors. The *pith* is what the RURAL wants.—EDS.]

Floricultural.

THE TRUMPET CREEPER—Bignonia or Tecoma radicans.

WE wish to call particular attention to this magnificent shrub, as its blossoms are larger and more gorgeous than any other we know, which is cultivated in our latitude. The one on our lawn has grown up as a shrub, and not as a creeper, the winter killing just as much of the ends of its branches as was necessary to make it a shrub, instead of extending it in long vines.

Our Bignonia is now six feet high, with a circumference around the outer ends of its branches of 17 feet. The petals of the blossoms are three to three and-a-half inches long from the green calyx, forming a cup three to four inches broad on the top. Their color is a resplendent light red on the outside, and bright scarlet, varying to light orange within. We have counted from 400 to 500 flowers on this shrub, the number varying somewhat as the season is wetter or drier. The reader may now judge what a gorgeous display this shrub makes when in full bloom. It is the admiration of every one passing the road fronting our lawn; at the time of its blossoming, inquiries are frequently made of its name and where it can be purchased.

It began to bloom July 11th, 1878, and continued till August 20th. On September 10th a few more blossoms came out and continued till the 17th. July 8th, 1879, it began to bloom and continued nearly as above. This year, 1880, it began to bloom June 26th. We cannot account for the earlier blossoming this year, except from the dry season, and the unusual excessively hot weather of the latter part of May and early in June. We know of no shrub which keeps in flower so long during the season as this Bignonia, or that presents so magnificent a sight.

Field Crops.

NOTES FROM THE RURAL FARM.

RARELY in years past at this season have we had so many days of rain and gloomy skies. The old pastures are green and beautiful in consequence. The long drought and excessively hot weather destroyed both clover and Timothy, and wheat stubbles are again being plowed up and reseeded. Up to this time there has never been a more favorable season for corn than the present. It is very tall and well set. But this remarkable growth has been somewhat at the expense of roots which, in the soft muddy ground, could scarcely hold up the stalks should a brisk wind occur. Our Mold's Ennobled oats gave us a great yield, being raised upon ground that suffered less from the drought than the higher surrounding farm lands. One-twentieth of an acre was measured off from which we shall be able to determine the yield of the entire field with tolerable accuracy. We are now thrashing and weighing our experiment wheat plots—a tedious task—and shall soon be enabled to give our readers whatever there may be in connection with them that is worth their knowing. We may remark, however, that Mold's (English) white and red winter wheats have proven nearly worthless here. The straws are heavy and short—the leaves broad. The heads are large and showy, but the kernels are small and shriveled. We know not what effect the wet weather may have upon our potato experiments. At present the vines are thrifty and green.

Our eleven kinds of the cow-pea have only begun to vine within the past few days. They were planted in drills 12 feet apart, upon sandy land without manure.

Early Minnesota Cane and a new kind of Broom Corn of each of which a half acre was sown were killed by the drought. We received from Mr. J. J. H. Gregory, Marblehead, Mass., the seeds of a new kind of Chinese fodder plant. The seeds germinated freely, but less than a dozen plants have withstood the burning drought. From the same seedsman we received a package of sweet corn said to be the earliest of any known. It was planted May 20, at noon. We picked our first mess on the morning of July 20—61 days. It is very prolific, bearing its ears almost upon the ground. They are of medium size—8-rowed sweet and tender.

Weeds are having their own way and field work is and has been for a week at a standstill. Our oats are still in shocks and we despair of getting it in stacks in a sweet condition.

BEAUTY OF HEBRON POTATO.—This potato proves with me a valuable acquisition. Planted upon the same ground and at the same time as the Early Rose, it was large enough for cooking 10 days sooner than the Rose. The yield is double and the quality at least as good. Thanks to the RURAL for disseminating it.

NELSON RITTER.

Farm Economy.

A SCIENTIFIC VIEW OF COMPOSTS.

PROFESSOR F. H. STORER.

It is a very old maxim that by mixing dung and peat (*i. e.*, swamp mud or marsh mud) in the proportion of one load of the former to two, three, or four loads of the latter, according to the quality of both, and allowing the mixture to ferment, a new and valuable kind of manure will be obtained, different from either of its components and on the whole superior to them.

The truth of this conception admits of no doubt. The merit of the method of procedure has been proved by so many different farmers, in different countries, that the maxim must be accepted as one resting upon a solid basis of fact. It has been largely acted upon in many localities, particularly in Scotland and in some parts of New England where the making of composts was at one time highly approved. There cannot be the least doubt that such composts are admirably well suited for fertilizing a multitude of soils in many localities. The fact of their being useful and convenient manures was proved long ago. The question which interests the farmer to-day is whether he can get in any other way, at less cost, as good a manure as the compost yields him; and upon this point there is great need of precise experiments made to determine whether, at a given farm, composts are not really as economical as they are efficient.

As commonly made, peat composts are to be classed among nitrogenous manures; and it is to be remembered that those nitrogenous fertilizers which are commercial products, to be bought with money, are precisely the hardest to get and the most costly of manures. There is a strong incentive therefore for the farmer to make them himself, if he can do so with economy. It may here be said, in parenthesis, that though nitrogenous food is the kind most commonly predominant in composts it would not be difficult to prepare composts which should contain all the other important elements of plant food beside nitrogen, and there are probably many farmers so situated that they should find their profit in so doing rather than in buying mixed chemical fertilizers such as crowd the markets and darken counsel nowadays.

Many approved methods of making composts have been put upon record in past years. Professor Johnson, for example, refers to many of them in his little book on "Peat and its Uses," and the back volumes of most agricultural newspapers contain numerous recipes. It is not improbable, however, that most of these recipes admit of being improved, in the light of existing knowledge, and it is much to be desired that those farmers who make composts nowadays should strive to improve upon the older practices.

There are several different kinds of chemical changes to be distinguished in the preparation of composts. In the first place there is the hot putrefactive fermentation, by which the condition of the peat or sods or other inert material is greatly changed, and the latent power of the materials to promote fertility is brought out. The character of this change may be illustrated by a reference to the old French method of making a quick manure from bone-meal. The bone-meal was thrown into small heaps, with or without the addition of a little loam, and the heaps were moistened with putrid urine or barn-yard liquor. Fermentation speedily set in and the heaps became hot while the pungent odor of ammonia was freely evolved. Bone-meal thus fermented was found to be a powerful forcing manure, much quicker of action than the unfermented meal. Before the introduction of Peruvian guano, which it is well fitted to replace in many circumstances, the fermented bone was highly esteemed. Now in this case there can be no doubt that the animal matter of the bone suffered fermentation and that ammoniacal and other products were formed such as are approved sources of nitrogenous food for plants. Unfermented bone-meal used by itself, is a manure of less rapid action because its nitrogenous constituents are comparatively speaking inert. They decay rather slowly in the earth and hardly at all if the earth be dry. But by the preliminary fermentation the character of these compounds is so changed that they become a manure of quick action. And so it is when the still more inert nitrogen compounds in peat are fermented. They undergo such changes that an active manure is the result.

With regard to the action of the "ferment," *i. e.*, the dung-liquor, in the case just now in question, it used to be said that matter in a state of decomposition or change is apt to impart this condition to other matters with which it comes in contact. The idea was in some sort based on the familiar fact that by placing burning shavings in contact with cord wood we can carry forward, as it were, the chemical action and bring to pass the combustion of the wood. But it is now known that fermentations such as the foregoing are due to the presence of living organisms. The dung liquor added to the bone-meal was charged with the organisms which cause putrefactive fermentation, just as yeast is charged with organisms proper for the fermentation of dough. So, too, in the compost heap built of peat and dung, the rotting dung is, so to say, the yeast whose inmates ferment the peat. And the dung and peat, together, afford fit feeding ground for the increase and multiplication of the organisms.

It is manifest, in this point of view, that those kinds of dung which ferment most readily will be most efficient as excitants in the compost heap; and it has been found in practice that "hot" manures, like the dung of horses and sheep, urine and night-soil, are particularly well-suited for the purpose. There are some peats so constituted that they will ferment of themselves in warm weather, even in the bog, doubtless from becoming charged with ferment germs deposited from the air. And there are other kinds that would slowly ferment in the same way, after having been weathered, if they were kept properly moist in warm weather. But by adding the active ferment in quantity, in the form of dung or the like, time is gained and an efficient, methodical action insured. In point of fact, few better examples of the hot fermentation can be found than those witnessed in the mixtures of straw or leaves and horse manure which are made by gardeners in the preparation of hot-beds. In this case, the heat generated by the mixture and the mode of its generation are considerations of the first importance; and special care is taken that enough straw or leaves shall be mixed with the dung to insure a regular, long-continued and not too rapid fermentation, with the attendant evolution of heat. Care is taken also not to use the mixtures until the first flush of fermentation has been checked, for the excessive heat generated in the earlier stages would be fatal to most seeds and plants.

Some methodical experiments made by Ulbricht in Germany upon bone-meal are interesting both as illustrating the character of the first fermentation in the compost heap and by enforcing the need of keeping this fermentation under control, in order to avoid too great a waste of the nitrogenous ingredients. Five hundred and sixty pounds of fine bone-meal were moistened with 12 gallons of barn-yard liquor, thoroughly mixed with some 1,100 pounds of "compost earth," and shaken into a heap about eight inches high. The temperature of the interior of the heap was then taken by means of a thermometer, and the increase of temperature was noted from time to time as the fermentation proceeded. In the beginning the temperature of the heap, taken at a depth of four inches, was 63 deg. (F), but in the course of 24 hours it rose to 117 deg., while an abundance of ammonia gas and steam was evolved, and at the end of 48 hours the maximum temperature of 129 degrees was reached. The fermentation then slowly subsided and the heap gradually cooled off. At the close of the third day the thermometer marked 122 deg., and it stood at 118, 113, 95 and 81 deg. at the end of the succeeding days respectively. No odor of ammonia was perceptible after the the seventh day. In the beginning the heap weighed 1713 German pounds and consisted of

Ash ingredients	1,215	lbs.
Water	331.5	"
Dry organic matter	167	"
	1,713.5	"

it contained 23.3 pounds of nitrogen. At the end of the second day when the fermentation had reached its maximum, the heap contained of

Water	159	lbs.
Dry organic matter	158	"
Nitrogen	19.7	"

so that three and a half pounds of the nitrogen of the bone-meal had been lost in the course of 48 hours, that is to say 15.6 per cent. of the original nitrogen. During the subsequent five days the weight of the heap diminished but little, and scarcely any more of the nitrogen was lost.

A subsidiary question of a good deal of interest is whether the dung used to start fermentation in the compost heap does not there decay in a more advantageous manner than it would have decayed in the original dung-heap. There are some reasons for believing that the comparatively speaking moderated and methodizing decay which the dung undergoes in the compost heap may tend to hinder the decomposition and loss of its nitrogenous constituents, which are apt to occur to a considerable extent in the dung-heap proper. The good results of the common practice of throwing peat, loam, straw or even sand into the barn cellar "as absorbents" may really be due in some part to the action of these materials in moderating the decay of the dung and changing the character of the hurtful decompositions to which dung is liable.—To be continued.

Farm Topics.

INFLUENCE OF THE "PRESS" UPON THE FARMER AND HIS "SURROUNDINGS."

RICHARD GOODMAN.

Madame De Stael wrote a treatise entitled "The Influence of Literature upon Society," the object of which was to show the reciprocal influences of literature, religion, manners and laws. A gentleman recently traveling through Massachusetts on horseback, accompanied by his son on a bicycle, noted how much better than a few years ago bread was at the various hostelries, and ascribed the improvement to the Centennial Exhibition at Philadelphia, where the Vienna and other breads created in many a new appetite for cereals, and taught, the hitherto untraveled Yankee woman how much virtue there is in the "staff of life," if made properly. But other influences have been at work for improvement, not only of bread, but of all other matters connected with agriculture and home comforts, and another De Stael might find amusement in tracing to the fountain-heads the divers causes which have put yeast into the whole leaven of rural society, and not only prevented its dropping to a European level, but so elevated it that, as has been remarked by an intelligent English traveler, among the working classes of the United States there are no *common* people. That is, we have here no low grade of agricultural laborers as in Great Britain and generally on the Continent, but as the English girl, on a visit here, said, when rebuked for skating in company with a butcher boy, "she was not certain but he might yet be President of the United States," so there is a feeling at the bottom of all the hopes and aspirations of even the sons of the most moderate farmer and artizan that the highest positions in civil life can be reached by any one whose talents command success, without being handicapped by the accidents of birth or occupation.

Perhaps the three most prominent influences which have tended to the improvement of agriculture and its advance practically and scientifically have been the agricultural newspapers, the town, county and State societies with their annual exhibitions or cattle shows, and the example of the gentlemen of means with tastes for farming, who have in all portions of the country entered as a wedge between the adhesive habits of the plodding farmer, and broken into them, and emancipated him from their control. The agricultural schools and colleges whose influences are just beginning to be felt, hardly made any impression at the start, owing to the prejudices of the old-fashioned tiller of the soil against "book larning," and what he called the "new-fangled notions" of scientific instructors, and it is only now when the young men, more ambitious than their sires, return from these schools, and put in practical operation what they have learnt, and develop the resources of the farm and turn their knowledge into money, that these creations of the general government are estimated at their true value, and we shall yet find them appreciated more and more highly by the whole community agricultural and otherwise.

But it is the continual dropping that wears into even the stone, and conservative as the farmer is, and ever has been, no influence less continuous, progressive and puncturative than the constant preaching of the agricultural papers could have softened his pachydermatous nature, and prepared it for the more irregular activities which have assisted in converting the modern agriculturist into the humane biped he has become, and his farm into its present, comparatively lucrative source of income. I say "humane," for the old-fashioned, non-reading farmer was, and is, inhuman, especially to women and "other cattle" under his control, and he looked with callous indifference upon the slavish existence of the female head of his household, who rose at daylight to get his breakfast, and toiled the live-long day at the wash-tub, the butter making, in the kitchen at the cooking and ironing, and risked her life going to and from the distant privy through the wet grass, and brought the wood from the shed, being lucky if she did not have to split it herself, and the water a dozen times a day from the well, rushing then into the cold and wet from the overheated kitchen.

Those of us who are living in the more enlightened portions of the country think that all these evils have passed away, and wonder that the agricultural papers yet harp upon that string; but there are many farmers and even villagers well-to-do in the world with thoroughbred cows worth hundreds of dollars each and fancy horses, who yet live in their kitchens, sleep all Summer in feather beds, eschew fresh meat and vegetables in proper variety, know and care nothing about the conveniencies of the earth-closet, snuff up the odors of the sink refuse under the buttery window, see their "women" pine away before their eyes, and trust in Providence and that great secret of wealth formulated by Dr. Franklin and so much abused by his countrymen, "When a cent is got, keep it." What an existence for a rational human being do many of these farmers and their families lead day after day, subordinating everything to work and accretion of substance, depriving themselves of all comforts, to say nothing of the luxuries which all are entitled to in the present age, even eating food not for the enjoyment of it, but as a means of existence, and selecting it for its cheapness and not even for its wholesomeness, going the rounds of the daily toil as the horse in the tanner's yard, without much more mental exercise than it, and avoiding all amusements and rational exercises as improper interruptions of of their slavish labor.

This is no fancy picture even of a New England farmer's existence, for one of that class but recently died near me, who labored so from dawn to night that he was unable to lie straight in his bed, and had often to kneel at a chair, not in thanksgiving for blessings vouchsafed, for he wouldn't receive any, but to get a position which relieved the aching of his overworked body. The whole household, and especially the women, had to keep pace with his murderous stride, the cattle deprived of fresh air in ill-ventilated stables were sick and filthy, and the only consolation of these poor-rich people's existence was that their money increased while their enjoyments, if they possessed any, became beautifully less.

It will be time enough for the newspaper sentinels to forbear their constant warnings when the farming men are willing to provide their wives with everything necessary for their comfort and *have them fairly share the earnings of their mutual toil*, when the earth or water-closet replaces the horrible privy, when the refuse of the sink is carried under ground to a distance from the house, when the water is accessible in the kitchen by means of a pump, when the wood is plentiful and dry, and handy to reach, when the food is of a nature to agree with the constitution of women and children who have not as the men the continual antidote of fresh air, when a portion of each day is devoted to some rational relief from work, either in driving, walking or visiting, and the evenings are enlivened by sociable converse, reading or amusements, when the children are not overworked, but afforded all the advantages of education and plenty of play, when the cattle are kept clean and healthy, the hay cut early, the garden looked upon as an important adjunct in the enjoyment and preservation of health, and when, in fine, the farmer looks upon himself and family as deserving of all the reasonable comforts and enjoyments of life as any other human creature, and bestows them upon himself and them.

Lenox, Mass.

COUNTRY LIFE.

COL. F. D. CURTIS.

Observations Among Rural Subscribers.

Maple Avenue is a street a little over a mile in length, running due north and south, lying midway between two parallel roads half a mile apart. The road is bordered by maple trees interspersed with elm, and by the enterprise and benevolence of a former resident, Ammi Dows, now deceased, it was graded the entire length and the road-bed made smooth, hard and permanent with gravel. It is a memento ever reminding us of a generous, public-spirited and noble man, who brought to the homestead of his fathers a fortune made in New York, which he was willing to spend for the benefit of his less fortunate neighbors. This street is a continuous meadow or lawn kept with care.

Haying begins on Maple Avenue with mowing the road. This is the model street of the town and of the county, and every farmer takes the Rural, including the minister, the Rev. C. W. Backus, who now owns the Dows' homestead. Although Maple Avenue is a public highway, the expense of door-yard and garden fences, has been dispensed with in several instances and no inconvenience is experienced. This innovation, besides reducing expenses, has made the residences much more attractive by doing away with the untidy and cramped effects of old fences and dooryards. Mr. Backus has ornamented his farm front with a Honey Locust hedge, and at the same time made in the future a shelter for his orchard. The finest barn in the town is on this place. It combines wagon house and stable all under one roof. The scaffolds and flooring overhead are made of matched stuff, so there can be no litter below. A railroad track on the top is used to elevate the hay aloft and chutes convey it to the points where it is needed for feeding, where it is caught in boxes, which prevents dust and "muss" on the floor. In building his barn Mr. Backus coupled convenience with comfort for his animals and the idea that a barn should be ornamental as well as useful. He thinks that unsightly outbuildings often render a home repulsive which might otherwise be attractive.

Mr. Veeder last year raised the best crop of corn. He did it by thorough tillage. His oats

on the same field this year show the effect of this cultivation and are now ahead of all the others. Esquire Davidson, who now resides on this street, and Mr. Wicks, we suspect, have made an advance this year over their former good farming, taking neighbor Veeder as an example, and have worked their corn most vigorously, with a prospect of not being excelled. These farmers assert that corn will grow much faster while it is being worked, and in dry weather it should be cultivated often, as the more the ground is stirred and the mellower it is, the better it will stand the drought. Esquire Davidson and Mr. Wicks excel in meadows; better Timothy than they have we have not seen. Both of them are cutting this grass while in blossom. They think it makes better hay then, while the stems are soft. By the time the seeds form the stems become woody and lose their virtue, and the crop is made much more exhaustive by the maturing of the seed.

These farmers keep sheep as well as cows and make early lambs the source of profit with their sheep, counting on the wool to cover the cost of keeping. Forty-two cents a pound for their wool is a remunerative price, with from three to four dollars for each lamb. Their flocks are grade South Downs.

Mr. Wicks is working into Jerseys for his dairy, while Esquire Davidson has had faith in them for years. The amount of butter he makes from them is largely in excess of that from the same number of native cows. He once had a notion for grade Short-horns for milkers, but has given it up, as he argues it doesn't pay to keep a big cow for a number of years simply because she is big and will make a hundred or two pounds of beef more than a smaller one, which all of the time will probably make more butter. The difference in one season's keeping will pay for all of the difference in beef, and the extra feed for all the other years is thrown away. Esquire Davidson has been raising and fattening steers for market, but as the Winters are so long he doesn't think they pay as well as sheep or cows.

These farmers think that a stiff sod makes the best foundation for a crop of corn, and a good sod is best made by using plenty of manure with the wheat or rye when the grass seed is put in. It takes root better and doesn't kill out as much. They own improved implements, as by their use they save labor and can make more thorough tillage. Mr. Wicks works his farm of more than 100 acres with one team of horses. He keeps them up the year round, and although it is a little more expensive, by so doing they will do almost as much as two teams running to grass or poorly fed. Esquire Davidson has not forgotten the old notion for oxen, and they make a second team and when fully grown are turned into beef and a younger pair takes their place. In this way their growth is clear gain, which is often equal to double the first cost. These farmers have the independent ideas of their forefathers and raise their own breadstuffs.

Both of them have their own kind of corn which they have grown for years, Esquire Davidson favoring the small 12-rowed Dutton, while Mr. Wicks raises a superior variety of white. A row of apple trees lines the highway in front of a part of Esquire Davidson's farm, which bear excellent fruit. At Kirby Homestead, also on Maple Avenue, roots and stock are special features. Pigs are one of the leading kinds of stock. The surrounding country has been benefited by the stock bred on this old farm. An experiment is going on this season to determine how cheaply pigs can be raised and fattened. The proprietor expects to slaughter 125 pigs, and to grow them mainly on clover and roots, giving the young ones rations of corn three times daily. They are now doing well. He thinks he can make pork for three cents a pound with his system of feeding and management. He insists this is the only way we can compete with the West.

THE OUTSIDE AND THE INSIDE.

RUST IN THE SMALL FRUITS.—For a few years past fruit growers have been as much troubled with rust on some of the small fruits as they have been with blight, mildew and rot on the grape. This year strawberries were attacked worse than usual and earlier, and no small share of the blackberry vines, where the plant had some time stood, has been so far injured as to have had a full set of fruit nearly spoiled. No reference is here had to the *orange rust*, which is a thing by itself, but to a species much less colored and pronounced, but none the less fatal to the perfection of the fruit. Heretofore the Snyder, among blackberries, and the Wilson, among strawberries, have been hardy in every respect, but this year the fruit has been on many patches either wholly lost or greatly deteriorated. But in most cases it has been observed that the worst attacks of this new form of rust (if it is a new one) have appeared on fields which have previously borne two or three large crops—or on and which has been previously considerably cultivated in other crops. Further, on well manured, nicely planted patches, the rust, if it appeared at all, has been quite light and its attacks have not seriously injured the fruit. In fine, it appears that just in proportion as the lands have been exhausted of the mineral constituents of plant food, just in that proportion the rust has been violent and destructive. The inference then is, that fruits, and especially the sour fruits, are very exhaustive crops—that there can be no such thing as success in small fruit growing except by the renewal of the plants and the enriching of the field by mineral manures every third or fourth year; and finally, attacks of rust, in almost any form, are more due to the weakened state of the plant for the want of suitable food, than to any real and inherent noxiousness in the rust germ itself.

In the rearing and care of domestic animals and in the cultivation of plants the aim of the producer should be to furnish his stock healthful and abundant food and equally healthful surroundings, and in that way escape diseases which confine their attacks mostly to the weakly. In a majority of cases where an animal is attacked by a violent form of disease, it dies; but if it lives it has cost more than it is worth to save. But in the case of diseased vegetation of any kind, recovery is still more rare and therefore our efforts should be rather to prevent attacks than to attempt a cure after the attack is made—for such attempts are sure to cost more than they come to. Therefore, when rust, mildew and blight come, if their progress cannot be arrested at once by a timely application of manures or fertilizers, it will be found far more profitable to grub the diseased vegetation up, and replant anew, after supplying the soil with something more than the original complement of manures and fertilizers.

THE FRENCH REPUBLIC AND AGRICULTURAL EDUCATION.—A paragraph is going the rounds of the press affording the interesting intelligence that "the French Government has ordered a course of teaching in agriculture in every primary school in the country." I suppose this action must be accepted as a right and proper thing on the part of the republican government of France. But what shall be said of another, and older, and many think a better and a greater republic, the governing powers of which have suffered a vast system of schools endowed for the express purpose of teaching agriculture, to lapse into the insignificant form of what Goldwin Smith calls "One-horse Universities." If the Republicans of France deserve high praise for that recognition of agriculture, shall it be praise or censure that shall be meeted out to a collection of lawyers and politicians which deny a few thousand dollars to the Agricultural Department and refuse to make its head more than a registering clerk?

AN EXPERIMENT WHICH OUGHT TO BE TRIED.—It is not a little singular that no attempt, so far as reported, has been made to ascertain at how low a cost price cotton could be grown when undertaken under favorable circumstances and on a large scale. The cotton crop of '78 left first hands at something between seven and eight cents, and there was a universal complaint that the crop did not pay and that the cotton country would soon be impoverished, if such prices continued. Fortunately the following year afforded a crop of unusual excellence, of great extent and for which great prices were obtained, the advance in price over the previous year being fully three cents a pound and the increased yield more than a half a million bales. What the outcome of the crop of '80 will be, it is too early to speak of with confidence, but the reasonable chances are that it will be something more than an average one, for which fair prices will be had. But referring to the title at the head of this paragraph, I repeat that it is a singular circumstance that no one has attempted to ascertain at how low figures cotton can be grown, notwithstanding it is the main crop of ten great States, amounts to five or six million bales annually and fetches into this country, outside of that which is consumed at home, something like $250,000,000.

In the case of Indian corn, the great and the leading cereal, the late Mr. M. Sullivant of Illinois, sometime since informed us corn could be grown for ten cents a bushel for the field work up to the epoch of maturity; but almost another ten cents would be absorbed in the husking, cribbing and shelling, making the cost of corn 20 cents per bushel in Illinois where grown on a grand scale. As for wheat, Mr. Dalrymple and others of the Bonanza farmers of the Northwest, have demonstrated that cereal can be grown for something like once and a half the sum named by Mr. Sullivant, or from 30 to 35 cents a bushel, and now it seems to remain for some Southern planter of equal acres, energy and enthusiasm to show us how cotton may be grown for five and perhaps four cents and upwards. And it would appear that the thing can be done, since there is no reason for supposing those vast improvements in methods of culture adopted by Messrs. Sullivant and Dalrymple, and which enabled them to make crops at the cost reported, may not be applied to the cotton crop, and with similar results. And the time is not far off when the thing will be done, for at the late meeting of the Mississippi Valley Cotton Planters' Association, at Vicksburg, measures were taken to hold future fairs at New Orleans, Memphis, Little Rock and Montgomery, for the purpose of showing and comparing the various kinds of cotton-growing implements, with the ulterior intention of so improving them, and inventing others, that the farmers of the South may have the use of a system of machines which will enable them to do for the cotton crop what other machinery has done for the great cereal and some of the commercial crops of the North.

Perhaps there is something like a sufficient reason why the cotton growers of the upland portion of the cotton belt should stick to old methods and continue the use of antiquated tools and clumsy and inefficient machinery—the broken surface of the country, the accidents to which the land is liable, and its partially impoverished state may be the reason and explanation—but for the vast alluvial and level tracts of land in Mississippi, Louisiana, Arkansas and Texas, admirably suited to the cotton plant, there is no more excuse for the continuance of the old methods of cultivation, than for the farmers of the prairie of Illinois to grow corn after early New England methods. What machinery has done for the cereals on the fertile prairie of the West, other improved machinery will do for the cotton crop on the rich alluvial on prairie land of the South and Southwest, and when the time arrives, we may hope to see as great an increase in the sum of the cotton crop, as we have seen since 1870 in the production of the cereals.

Entomological.

NOTES ON CABBAGE INSECTS.

Though the Rape or European cabbage butterfly first appeared here three years ago, last year it was so abundant all over the State, that there were more of them to be seen than of all other kinds of butterflies, and even by "eternal vigilance" it was well-nigh impossible to raise cabbages without the heads being eaten by the caterpillars so as to be unfit for use. As these increased, the native Southern cabbage butterfly--Pieris Protodice--decreased, till last year it was a rare thing to see one of the latter.

Besides these two cabbage insects, there appeared last Fall another caterpillar, a little smaller than the Rape worm, the larva of a moth—Pionea Rimosalis—that we may call the Pionea worm. These are from one-half to three-quarters of an inch long, gray along the sides with a yellowish stripe along the stigmata or breathing pores. The back of the worm is blackish-gray crossed by transverse white lines of which there are five to each joint. These worms, when they reach their growth, enter the ground to pupate, where they weave for themselves a tough cocoon of silk covered with dirt on the outside. Inside of this the worm undergoes its changes, all but the Fall brood coming out as moths in two weeks. Last year the Rape worms were the most destructive till late in the season, but this year the Pionea worms have been more destructive than the others. In fact, the Rape butterflies are not so numerous as they were last year, while the Protodice are increasing so that one sees more of them just now in the fields than of the Rape. This shows that the parasites of the Rape are increasing, and these are not wholly confined to insects, for in some places the worms are attacked by a fungus disease, I am told, that is killing a great many.

In habits of eating, this Pionea cabbage worm somewhat resembles the Rape in that it not only eats the outward leaves but those forming the head as well, and is fully as bad as, if not worse than, our European importation. There must be three broods of the Pionea worms and possibly four or five, for the following reasons:—On June 10th we had full-grown worms which produced moths by June 25. The eggs from these produced the worms that have just disappeared from the cabbages, full-grown, to pupate. Last year we had worms late till the cabbages froze—and by the way, I do not know of a cabbage worm that will stand more freezing than this. The chrysalids I wintered over produced moths from April 23 to May 8. Moths hatching at that time would probably produce worms that would mature by the time I took them full-grown from the cabbages, June 10. This will give ample time for four broods of the worms from the first of May to the time that the cabbages freeze in October, and I am inclined to think there are that number.

The Protodice worm does but little injury here to cabbages, it feeding more on other plants of the cruciferæ family. I have not seen a cabbage Plusia worm on the cabbage in three years.

No remedy short of Paris-green seems to be of any account and that, of course, is out of the question, for the cabbages on which it might be employed would be unfit for use. Salt, pepper, soot and everything else that in one or two instances have seemed to warrant recommendation have, in nine cases out of ten, failed. I know of a few persons who are raising small patches of cabbages, keeping them from the worms by picking the latter off, and that seems about the only way to get rid of the pest. G. H. FRENCH.

ANNUAL FAIR LIST.

We herewith present a list of State and local fairs which will be held this Fall in various parts of the United States. Having been compiled for the most part from statements made by the officers of the several organizations, we believe the information here offered to be thoroughly trustworthy. Secretaries of associations, the fairs of which are not given here, will do us a favor by notifying us of the time and place of their respective fairs.

NEW SAFETY STEAM ENGINE.

THIS engine is manufactured by the well and favorably known Wheeler and Melick Co., of Albany, N. Y., with Graham's patent safety coil generator, and is especially adapted for agricultural purposes. Among the numerous advantages claimed for it there is room here to mention only a few. The first essential requirement for all farm engines is safety. In the purchase of engines for agricultural purposes this consideration should always hold the first place. This engine is claimed to be perfectly safe for this reason: It is constructed of one continuous pipe, and the water necessary to run it is only about two quarts per horse power at any one time in the entire length of the coils, the size of the pipe not exceeding the size of feed-pipe to the engine; consequently, if the coils should become ruptured at any point, it would cause only a moderate blowing off of steam, and as the pipe is tested to four or five times the ordinary working pressure, it would be almost an impossibility to even rupture a coil.

THE WHEELER AND MELICK CO'S. NEW SAFETY STEAM ENGINE.—FIG. 255.

The engine is extremely economical of fuel and time, for, owing to the small amount of water required in the generator, steam can be raised to a pressure of 100 pounds per square inch with cold water and ordinary fuel in ten minutes, consequently time and fuel are saved, while the rapid circulation prevents the deposit of scale. Then again, the construction of the engine renders it remarkably durable, light, simple and easy of conveyance from one place to another.

The well-earned reputation of the manufacturers is ample guarantee that the engine is made of the best material and in a thoroughly workmanlike manner. The coils are made of the best lap-welded pipe, and stayed; firebrick lining is above grates; there are a large grate surface; double jacket around coils; hinge-stack, to lower when moving; improved spark arrester; safety-valve as large as pipe in coils; jacket around separator and cylinder; engine an improved upright pattern, with balanced crank; extra long bearings; steel connection-rod and cross-head, with improved brass gibs for taking up the wear; brass stuffing-boxes and followers; iron trucks; easy spring seat; steam whistle; steam and water gauges; large ash-hearth; suction hose, oil cups, wrenches, whiffletrees, etc.

Two kinds are made:—No. 1 is usually rated at from five to eight horse power; weighs 2,500 pounds and costs, at the shop, $650. No. 2 is usually rated at eight to twelve horse power; weighs, complete, about 4000 pounds and costs, at the shop, $850. Full information will be promptly furnished on application at the above address.

The Sandwich Cord Binder.

A member of the RURAL staff writes us from Sandwich, Ill., under date of July 26.

"I saw the working of the Sandwich Manufacturing Company's new Cord Binder (Travis's patent) to-day in a field of oats on the farm of Artemus Miller, Sandwich, Ill. The binder did excellent work, binding the gavels tight and even. It is lighter than the majority of self-binders and as it has shown good work throughout the several tests that its manufacturers have put it through, it will be likely to prove a popular binder. It will be put upon the market next season. This new cord-binder has several new and important features:—it does not elevate the grain as high as most binders and discharges the bundles nearer the ground. It has very little machinery to get out of order; it has a new vibrating butt-evener that is very effective. As simplicity is now sought for in all kinds of agricultural machinery, this should prove a success."

[Full information regarding the above binder will be furnished on application to the Sandwich M'f'g Co., Sandwich, Ill. Eds.]

Miscellaneous.

WHAT OTHERS SAY.

THE London Times says: No crop, is is said, will be an average. The wheat plant is not tall or strong, and the ear is small. The root crops have only just been placed ont of danger. Upon the whole, it is very doubtful whether this year will do anything to make up for the losses of the past.

WE are glad to see that Mr. Hovey is so much the friend of the Baldwin apple that he cannot bear to hear it spoken ot as "utterly worthless." An apple, Mr. Hovey says in the London Chronicle, so well known by Englishmen as the Baldwin, whose exportation to England has increased within a few years from a few hundred barrels to almost as many thousands, would seem to require no additional evidence of its excellence. It is *the* apple of the New England States, and indeed of the whole Northern United States; and, taking it in all its qualities, has more excellences and fewer faults than any other apple in the world. That a variety now approaching a century old still keeps in advance of every other variety that has been produced since its origin, shows what a valuable fruit it is. At one time the Newtown Pippin was the only American apple known in the London market, and though, from its very hard, firm flesh, and long-keeping qualities, it is the best variety for shipping without loss, the greater beauty of the Baldwin, its crisp, tender flesh, and remarkable combination of sweet and acid, are causing it to take the place of the former, which can only be grown in a few favored localities in the Middle States.

Mr. Hovey was therefore quite astonished to see an account in an English journal, copied from an American paper, stating, upon the authority of Mr. Ellwanger, of Rochester, N.Y., that the Baldwin "as a table fruit is utterly worthless," and could not be eaten without "direful results." As Mr. Hovey has not only grown it for 40 years, and eaten it before breakfast and after supper during all this time in preference to any of the 200 varieties he cultivates, and has not yet experienced any "direful results," this statement took him by surprise. If this were true he should deem it his duty to caution the English people to purchase no more of the thousands of barrels which will probably find their way to the London market.

However, strange to say, Manning, Downing and other American pomologists class the Baldwin as "standing at the head of all New England apples, and unquestionably a first-rate fruit in all respects." The latest report of the American Pomological Society (N. Y.) says that it has "stood and still stands pre-eminent as a market fruit," and that it continues to be the "leading apple," and "whatever profit has been made from raising apples is mainly due to this variety." Even in Rochester, New York, at a meeting of the Western Fruit Growers' Association, it was recommended that in an orchard of 1,000 trees at least 700 of that number should be Baldwin.

THE SPARROW in England has few friends. A writer thus expresses himself in the London Farmer: If a tithe of all the maudlin sentiment expended on birds which are only evil and mischievous in the garden were bestowed on the gardeners who are the helpless victims in many places of their sweeping raids and incessant depredations, it would be more humane and—well, infinitely pleasanter for all parties concerned. I have been constantly a lover of birds from my childhood, am never weary of their winning ways and pretty plumage, nor too tired to listen with something akin to rapture to their sweet songs; but the early chatter of sparrows is suggestive to me of a ravenous crew of thieves starting forth in gangs to steal or wreck all that is most crisp and sweet in the garden. Let no one talk or write to me of early birds gathering the worms; the sparrow never eats one, nor a caterpillar, but crisp lettuces, bursting fruit-buds, sweet marrow peas—these they cram themselves with all day long, till they are almost too lazy or fat to flounder or rather fly home to their roosts in the eaves. The mischief they do to thatched cottages is also incalculable. In a word, the sparrow is a nuisance to get rid of.

not a feathered friend to be pitied and fostered, as our writers in big towns and easy chairs, who may or may not have ever seen a sparrow in their lives, and are profoundly ignorant of their depredations, assure us. Cultivators *en masse* exclaim: "Save or deliver us from such friends." "Give me any number of grubs," the same writer continues, "caterpillars, worms, snails, slugs even, but rid me by any and all means of the sparrows, who are thieves and robbers on the most gigantic scale in our gardens and on our farms. The quantity of good vegetables and solid grain they destroy is appalling. The latter is a most vital consideration at a time when of every three loaves eaten two are of foreign growth, and every provincial fruit and vegetable market is crowded with foreign produce, brought to us, if not from China to Peru, yet from all parts of the world; and this while the house-sparrow is reveling and ruining the best of our food."

We have seen grass sown with turnips yield a crop the first year after sowing almost equal to one that had occupied the ground two years before being cut. There is no reason, therefore, that we know of why those who wish to try to get a crop of grass the first year after sowing should not have a crop of turnips at the same time.

Those who have not tried grass and turnips together can do so without any risk as to the labor or experience; and a single experiment may be sufficient to determine the matter. The best crop of turnips we ever saw was sown with grass. [We have lost the "credit" for this.]—Eds.

The query raised *why grass colors butter yellow*, instead of green, is answered by Prof. Arnold in the New York Tribune. He says that chlorophyl, the green coloring matter of plants, is neither digested nor appropriated by milk-giving animals, while the yellow fats which abound in grass, are assimilated without change.

"Viburnum plicatum.—We are glad to see that our repeated commendations of this noble shrub are now being seconded in many different quarters. An American writer who is peculiarly partial to the English press, speaks in the Gardeners' Chronicle as follows: "Among the flowering shrubs the recently introduced Viburnum plicatum holds a prominent place; next to Hydrangea paniculata grandiflora, I deem it one of our greatest acquisitions. The neat and symmetrical habit of growth, its very handsome plaited leaves (indicated by its specific name), and the profusion of its moderate-sized balls of snowy blossoms, which quite cover the plant, render it unusually attractive and beautiful. As single specimens planted in appropriate situations, it is quite as ornamental as a rhododendron or azalea, and if its foliage were evergreen it would be a formidable rival in ornamental plantations."

Seedling Roses are very uncertain, says Mr. Laxton, of England, as to the period of showing their first blooms, some flowering when little more than two inches high, and within two or three months from the seed being sown, and others, although often eventually proving good Perpetual Roses, do not show bloom for several years. I have now seedlings of the current year showing bloom. My crop this season consists of upwards of one thousand seedlings grown on a bed containing about two square yards; most of these are already planted out, and several of them I hope to bud, bloom, and primarily test before winter. In the ordinary course at least one-half will probably disappear before next year from delicacy of constitution. These I shall not regret.

The graft, says C. A. Green, in the New York Tribune, has a remarkable effect on the roots of the stock. In starting apple trees in the nursery, we graft on roots of seedlings, all of which, if unaffected by the graft, would exhibit no especial character; but when we dig these roots, after being affected by the graft for three or four years, we find that those grafted with Red Astrachan, for instance, are very fibrous, branching out near the surface, with few tap roots, while the rows adjoining, or parts of the same row, grafted with the Duchess of Oldenburgh or the Fameuse, are destitute of fibers, possess only three coarse prongs, as a rule, one of which is liable to be a tap root seeking an abode far down in the subsoil. It takes my men twice as long to dig a row of Fameuse or Duchess as a row of Red Astrachan, and when planted the roots of all were of the same character.

The London Live Stock Journal says: At the recent agricultural meeting at Mélun, in the Department du Nord, the most noticeable feature of the show was a splendid collection of Merino sheep, for which class there were no fewer than sixty entries. Our French neighbors appear to be devoting special pains to the development of this breed, which, although a comparative novelty with them, is rapidly becoming a fashionable as well as profitable strain.

Prof. Sheldon says that "It is always so; the reward of the toiling producer is ever less than that of him who merely distributes."

Some years ago, says the Ohio Farmer, D. M. Ferry grew 600 bushels of onions on an acre, for which he was offered $2.50 per bushel, making the snug sum of $1,500 from an acre. A farmer who heard of it, and knew no more about onion-growing than he did of Sanskrit, planted five acres of common corn land in onions, the next season, the seed costing him $100. He didn't grow a bushel of marketable onions. Had he studied up the subject and planted the first season an eighth or fourth of of one acre, he might now be a successful onion-grower, whereas he indulges in profanity at the smell of an onion.

Again referring to the First Annual Report of the Cornell Experiment Station, Professor W. S. Barnard says of the Grape phylloxera that in that vicinity, the adults and eggs were mostly destroyed last fall by two of its enemies, a larval *Syrphus*-fly and a small mite. This pest has confined itself there almost exclusively to the wild vines, but he has found it, in a few instances, on the cultivated vines of the west hill. Foreigners would do well to import and cultivate its natural enemies.

Mr. E. P. Roe says "Within a few years a new variety of strawberry named Windsor Chief has been disseminated and the enormous yield of 17,000 quarts per acre has been claimed for it. It is said to be a seedling of the Champion, fertilized with the Charles Downing variety. If there has been no mistake in this history of its origin, it is a remarkable instance of the reproduction of the traits of one parent only, for in no respect have I been able thus far to see wherein it differs from the Champion.

Mr. J. T. Lovett says that Glendale is the best *late* strawberry yet fully tested either for home use or market, succeeding on all soils and under all systems of culture. Of the Bidwell he says: "This is a very promising variety, being of strong growth and producing a heavy yield of large, conical, crimson, smooth, firm berries of excellent quality." He picked a pint of large, ripe berries from a single plant at one picking.

Points in Bee-keeping.—The following points in bee-keeping are extracted from a prize essay by Mr. J. E. Johnson, of St. George, Utah.

Necessary Qualifications of a Bee-keeper.—To make a proper and successful apiarian one should love and take special interest in the business, and in all that pertains to the successful management of bees, carefully noting the observations, experience and instructions of intelligent and successful bee-keepers; patient in observing and supplying the wants of the colony and assisting it to accomplish the most rapid progress for the increase of bees and honey, and at all needful times to guard them from too great cold, heat, or moisture, from birds, toads, moths and other insects, and generally treating his useful colony with quiet gentleness and considerate care, never disturbing them unnecessarily, or annoying them by quick or boisterous motions, always avoiding timidity, nervousness or fear.

Profits of Bee-keeping. — When this branch of industry is practiced in a careful and intelligent manner there is no ordinary business within the scope of my experience that remunerates as satisfactorily as bee-keeping. "Good luck" is good, intelligent management, and "bad luck" is the reverse. Many a person invests in a swarm of bees, expecting it to make his fortune. He is ignorant of their wants, neglects them, except to rob them of their honey, and perhaps destroy the queen. They dwindle, grow less, moth or robbers attack them, the colony disappears, and the owner curses the business as a bad speculation. With proper care and intelligent management, one year with another, bees will average an increase of 100 per cent. clear of expense. The surplus honey will pay for the hives and care, and with ingenious finessing one may make from two to four and sometimes ten or a dozen colonies from one, it being strong and having a prolific queen.

Besides a fair increase of bees, instances are not rare where 100 and more pounds of surplus honey per hive have been taken in a season from each colony. The business is easy and interesting, and may be performed by women, or even by children who have aptitude and taste for it.

Best form for Apiary.—After trying several plans, I have hit upon the following, which I think is original and most convenient, as economizing ground-room, shelter, and obviating the necessity of manipulating bees in front of any hive; it also saves steps and time. Set two rows of posts seven feet apart and about six feet apart in the rows or they may go further apart, and stand seven feet above the level surface. Fasten to the posts *knees* for the bench, or seat to rest on about 16 inches high. Place stout 12-foot boards 16 inches wide thereon, and nail them down. With bolts or thongs fasten poles at the top of the posts lengthwise, and make a shade of willows, or you may make a lumber roof. Set your hives on the seat, back towards back, and you have between the two rows of hives an avenue four feet wide, where you may pass along, for observation, unmolested, and work both sides behind the hives. This also gives room for a two-foot table. The hives, if painted in different colors, may be set within six inches of each other without detriment. I have nearly 200 colonies in just this style, only the hives are set close together, where the bees work regularly without disorder. After trying this plan for two years I pronounce it a decided improvement upon the old plans.

The best Hive.—None but frame hives should be used, and these should measure at least a cubic foot inside. The frames should have the beveled honey guide and be so shaped that they may be drawn from the top. The hive should have ventilation above and a regulator at the entrance that it may be closed if desired in case of robbing or bad weather.

Transferring from Box Hives.—Pry up the cap of your old hive a little all around, then turn it bottom-up and place your new hive over it, wrapping a cloth around to close any hole where bees might go out. Then with a smoker blow in smoke below and rap the hive a little, and continue this until the bees have generally gone up into the new hive, then place it on the seat, set your old hive on a table, pry off two sides and carefully cut out the combs, one at a time. Lay your frame over that portion containing the brood and cut around inside of the frame with a knife. Remove the pieces, press the frame over the comb, and fasten it around with small wire or waxed twine, and so continue until all you desire, together with all the bees remaining, are transferred to the new hives, which should be set in the places occupied by the old ones.

To Introduce a Queen.—Daub your queen all over with thin honey and place her in the hive; or, what is better, place your queen in a small wire-cloth cage, about two inches square, with plenty of food. Place the cage at the bottom or on top of the frames where the bees may get near her. After two days turn her loose and she will be received and adopted as the mother of the colony.

To rear Queens.—Take the queen away from a strong colony and they will at once make from one to a dozen queen cells. Within 12 or 13 days after the queen has been removed, carefully cut out all but one of the cells, fastening one in each new hive or queenless colony. If the cells are not removed within two weeks, the first queen that hatches out will be accepted and all the others destroyed.

Queenless Colonies.—A colony without a queen grows daily weaker and is always in danger of being destroyed by moths or bee robbers, and even if not thus destroyed the colony will disappear in a few months, having lived its allotted time. It may be known by the slow and sluggish working of the bees, by the crazy manner in which they run around in front of the hive, and the more surely by their having no young brood or eggs. Give such a hive a queen cell, if possible, or give it a frame of eggs, brood and young bees, and change the place of the hive with a strong colony. Make sure you have plenty of young bees, or you will fail at last in getting a queen cell; for remember it is only young bees that are workers of wax.

To Equalize the Strength of Colonies.—Sometimes a colony may have an old or otherwise unprolific queen; may have been troubled by encroachments of moths, or from other causes may be weak, while other colonies in the apiary are strong. You wish them, doubtless, to be of about equal strength, as they should be. Take one good frame of brood from as many strong hives as needful and put in the weak, exchanging empty or poor ones for full if need be, and should this not be considered enough, change places with a strong colony you have not touched recently.

Robbing.—If a thieving attack is made upon a hive by bee robbers, it may be known by there being a profusion of bees flying about in front and near the entrance, going and coming, alighting and leaving, running about excitedly in great numbers and fighting and falling to the ground. Inside, too, it is all excitement. When robbing is discovered the hive should be ventilated and the entrance so closed that a bee cannot enter or go out. Open it just before dark so one bee may pass and close again just before sunrise. When the excitement is so far over that robbers do not return, open the entrance for one to pass at a time, or, what is far better, at once remove the hive attacked to a distance, perhaps away from the apiary; sometimes when the colony is quite strong you need only close the entrance passage so that not more than one bee can pass at a time, and they will protect themselves.

Moth and Worms.—The bee-moth lays its eggs in the combs or elsewhere and then dies. These eggs produce a worm very destructive to the comb and honey by making passages and galleries through the comb, fattening itself on the honey and forming a web that protects it and is very annoying to the bees. When about three-fourths of an inch long and a sixteenth of an inch thick it is full-grown and winds a web or cocoon for itself that hatches out another moth. The best possible remedy for the moth is strong colonies and good, tight hives. A strong colony protects itself from encroachments, but a weak or queenless one often falls a prey. When a hive is attacked, clean out the moth and strengthen your colony, or if too foul with moth clear the hive thoroughly, saving only such combs as you do not suspect of being infested with worms or eggs, give the colony new frames of brood and supplies, and make them strong enough to protect themselves.

Wintering Bees, Feeding, etc.—Bees will winter well in good hives, and protected from the winds, in any settlement in Utah that has been tried. After the honey season has fully closed carefully examine each hive and take those that have no queens and put the bees and such of the supplies as are needed into the hives of the weakest colonies, sprinkling all bees together with sweetened water, scented with peppermint. Strengthen up any colonies that are weak and keep a few full frames safely from the moth, with which to feed any colony that may chance to be short of supplies before flowers bloom. Honey, dissolved sugar and rye flour may be placed on a plate over the frames in the top of the hive. A colony may be stimulated to early and abundant brood by feeding before flowers come.

Good Honey and Pollen Plants are white clover, buckwheat, currant, gooseberry, cucumber, melon, squash, pumpkin, lucerne, Great American bee-plant, bloom of all fruit trees, mignonette, Canterbury bells, sweet clover, corn, and a great variety of wild flowers.

Drones.—One drone for each queen is all that is really needed. All others are a surplus, and only live to make the colony poor in honey. All unnecessary drone brood should be cut out and empty drone comb kept at the sides of the hive and always away from the center, for storing honey. When too great a quantity of drones fills the hive, it should be opened and most of the drones should be destroyed or a drone trap used.

Best Time to Handle Bees.—In midsummer, from early morning until 10 A. M. is the best and most quiet time, when many of the bees are out. They should never be disturbed at night or when the air is damp or chilly, or it is windy.

Foul Brood.—Where the hive is too full it is probably the best plan to drive the bees into a new hive, giving them frames for a healthy colony to start them. Never allow a particle of foul brood about the apiary where bees can reach it, as it is considered a contagious disease. The infection may be carried to a sound hive by bees passing over the combs. An infected hive should not be used until thoroughly disinfected by fumigation with sulphur or boiling water.

Everywhere.

RURAL SPECIAL REPORTS.

Ark., Saratoga, Johnson Co., July 22.—We have here a high, dry, healthy locality. Some of the land is level; other parts are undulating and hilly. It is well adapted to the growth of all kinds of fruit, such as apples, peaches, plums, cherries, quinces, etc. Corn yields here from 20 to 60 bushels per acre; cotton, from 12 to 15 cwts.; Irish potatoes, 150 bushels; sweet potatoes, 100; wheat, 10 to 25; oats from 20 to 75; rye, 15 to 30; barley, 40 to 50, bushels per acre. Walker and Mediterranean are our favorite wheats. We have here some 25 to 30 medicinal springs; good, free, common schools, there being 46 common school districts in the county, and one seminary and college. We have, too, good water power, and for transportation, steamboat navigation and railroads.

J. S.

Cal., Penryn, Placer Co., July 18.—We are located in the foothills, 28 miles from Sacramento and 170 miles from San Francisco on the C. P. R. R. There is nothing raised for sale or shipment in this vicinity but fruit. In the western portion of the county the farmers raise grain. The principal grains raised are wheat and barley and owing to the character of the soil they seldom fail to have a good crop. They raise but very little oats and rye and no corn and but few potatoes—none for market; Early Rose for house consumption. This will apply equally to our locality so far as potatoes

are concerned. We raise and send to the San Francisco and Sacramento markets a general assortment of fruit. First in the season come strawberries. This year the crop has been a short one, owing to the late frosts and unusually late cold rains. The variety principally raised is the Monarch of the West with some of Seth Boyden, Capt. Jack, Triomphe de Gand, and Longworth. The prices have been very fair. The Raspberries come on so close after these that we have no rest. This season we have had an excellent crop and have received good prices for them, ranging from four to 25 cents per basket of eight ounces. We pack 15 baskets in a case. At the latter part of the season, as apricots come in, they occasionally get down to 50 cents per case, but not often. We pay one and a half cent per basket for picking. With regard to blackberries we pay one cent for one-pound baskets, and get for Early Wilson from 12c. to 20c. and sometimes for the earliest 25c. Kittatinny and Lawton usually and (particularly this season) bear good crops and bring from six to 10 cents per pound basket. The crop of apricots is small. Royal and Moorpark are the varieties raised. We have but few peaches this year; the late varieties are almost a total failure. In some localities there is a good crop of Alexander, Downing, Briggs, Red May, Amsden's June, Hale's Early and in fact of all the early and midsummer varieties. Pears and apples are short crops; figs a good one. plums and prunes are short; cherries plentiful and low. All kinds of stone fruit do well, and we have *no disease* or pests. I forgot to say that the only raspberries we raise are Red Antwerps. One of my neighbors told me that the RURAL NEW-YORKER sent him some Cuthberts two years ago, but he did not like them as well as the Antwerps. "And" said he "I have not given them a fair chance." Men often, I find, get a new variety of fruit from a friend, and as it cost them no money, they stick it in some spare corner and perhaps wholly or at least partially neglect it. It does not produce as well as varieties thoroughly cultivated and is pronounced worthless. According to my ideas this is decidedly unjust. On the other hand, we buy new varieties that have been tested by high culture; put them out; give them average field cultivation and they fail to realize our expectations, and at once *they* are pronounced worthless and the originator a gross humbug. This is another case of unfairness. I should have said sooner that the grape crop will be large; the varieties raised principally to ship, are Chasselas, Sweet-water, Black Hamburg, Rose de Peru, White Muscat of Alexandria and Flame-colored Tokay. J. W. B.

CAN., Collinville, Lambton Co., Ont., July 15.—Lately we have had some heavy rain and wind storms that flooded the low lands. The land hereabouts consists of slight ridges and swales with very little fall, while some of the township is swamp. The storm laid a considerable amount of grain flat. Some of the Fall wheat is cut, the straw is slight, but the grain seems good, but late-sown oats and barley are at present drowned. Potatoes are mostly poor. C. M.

CAL., Eagleville, Modoc Co., July 20.—Wheat will average about 25 to 30 bushels per acre: barley, 40; oats, 35; potatoes, seven tons. Corn and sorghum are not grown here to any extent, Apples, apricots, gooseberries and currants are the fruits chiefly grown. The prospects for fruit are tolerably good. S. K.

COL., Alma, Park Co., July 20.—No grain is raised in this part of the State. Mining and stock raising are almost our exclusive industries. H. W. H.

ILL., Cisne, Wayne Co., July 19.—The wheat crop is fine this year; the acreage one-third larger than ever before; the yield is from 8 to 22 bushels per acre. Corn is promising. The chinch bug has troubled but few crops. A small hail storm visited the county a mile south of me and nearly ruined all standing crops; it was accompanied by a general deluge of rain all over the county. The oat crop is small. Very little rye is raised and no barley. The comparative acreage is: four of wheat to seven of corn; five of corn to one of anything else. Sorghum or millet, as it is called here, is only raised for home use. The fruit crop will be good this year. We have no good Winter apples; Ben Davis and Winesap are the most common and successful. The people have been imposed upon shamefully by tree agents and do not really know—not one out of ten of them—what kind of fruit they have. H. A. T.

IND., Orland, Steuben Co., July 23.—Wheat and corn are good, but oats are light. Potatoes would have been a good crop if the bugs could have been kept down. Perhaps they will be one-fourth of a crop. Apples, peaches, pears and grapes are fair crops. O. M. T.

IOWA, Marshallville, Delaware Co., July 23.—Winter wheat is a failure hereabouts; no Spring wheat. Of corn a great deal was planted and the general prospect for it is good. Oats will certainly give a fine yield and a large area has been sown. Potatoes and grass are both good. A considerable amount of sorghum was planted here; but the outlook for it is not very promising. A sugar refinery for making sugar from the cane is being erected in this neighborhood, and a good deal of sorghum was planted for this purpose. I have a mill for making molasses from it, but now we are all in hopes of soon producing our own sugar. We have had rather too much rain since May. Fruits of all sorts are quite plentiful. N. C.

IOWA, Iowa City, Johnson Co., July 20.—In this section there will be a fair average of wheat. The prospect for corn is better than last year at this time and 25 per cent. above an average. Oats are good and will yield 40 to 50 bushels per acre. Rye was somewhat winter-killed, not a full crop. Barley but little grown. Prospect for potatoes good. The kinds of wheat mostly grown are Odessa and Tea; of oats, white German; of potatoes, Early Rose and Peachblow. Sorghum is very little grown, but it does very well. Berries of all kinds do well. The Concord grape is a success. This can hardly be said to be a reliable apple country, though we have a fair crop this year. Early fruits of all kinds have been plentiful. L. R.

IOWA, Sibley, Oceola Co., July 22.—Wheat is rusted considerably. I think it will average only about ten bushels per acre. Some pieces are entirely ruined by the rust. All other grain crops are in fine condition. Not much fruit is grown here yet. My raspberries have done better this year than ever before. It is only nine years since the first settlers came into this county, so there is little chance for tree fruits yet. H. A.

MINN., Howard Lake, Wright Co., July 20.—We are, and have been enjoying the most delightful weather for some ten days, just cool enough to be pleasant, with a few, short, quiet showers interspersed. For four days, up to the closing of the 13th inst, we had intolerably hot weather, the mercury being so high as 100, at six a.m. one day. During this heated period, many fears were entertained by farmers that rust would strike the promising crop of wheat in this region, but it is said there are no fears of that kind since the cool breezes came. And the general opinion is that there has not been in many years, as good a prospect for an extra crop of wheat, as at the present writing. Potatoes, corn and oats, as well as grass are proportionately good. We had in June two weeks of almost constant rain, so that those whose corn was ready to work, had to be as patient and hopeful as they could till the water ran off so they could get in the fields again, and those who had intended to plant more on new ground had to give it up entirely. Corn is sometimes planted here as late as the 10th of June. Early varieties are seldom much frost-bitten before they are ripe. There have been less scourges this year than usual—fewer beetles on potatoes, and even the squash bugs were not as destructive as formerly. There has been some loss of small fruits this season, but there is a fair prospect for apples, and a fine one for grapes, as well as an abundance of wild plums, which are very good when we cannot raise other varieties. The results of the last hard Winter were not as bad as was feared in early Spring, as "standard apples" are being used for cooking purposes; these are from some young trees of our own fruiting from the first blossoming. S. A. M.

MINN., St. Paul, Ramsay Co., July 21.—The weather during the past few days has been cool and clear and could not have been improved on for the maturing crop of wheat. The daily reports from the stations along the St. Paul, Sioux City & Omaha railway indicate a great change for the better in wheat, and the best informed and most reliable observers now estimate an average yield of from 12 to 15 bushels per acre along this particular road. As the plant is rapidly heading the danger of blight or a shriveled berry by reason of a hot sun is growing slight. And if we are to be blessed with good weather in harvest operations Minn. may be relied on for at least 35,000,000 bushels. The Secretary to the State Board of Immigration estimates the yield as high as 45,000,000, but past experience has demonstrated that popular estimates of the wheat crop are at this time of the year too high. All reports agree that oats and flax never looked better. The acreage in flax in Southwestern Minnesota and Northwestern Iowa is double that of any preceding year. Farmers of that region have learned the adage "Never put all of your eggs in one basket," and are yearly more and more getting out of the notion of exclusive wheat growing. The experiment of sowing flax on new breaking is highly satisfactory, and it has been largely done this year with promising results. J. B. C.

MINN., Forest Mills, Goodhue Co., July 21.—Of wheat the average yield in bushels per acre, hereabouts will be 18; of corn, 35; of potatoes, 200; of oats, 50; of barley, 40. No rye is raised here. Fife, Rio Grande, Lost Nation, and White River are our chief varieties of wheat. The acreage of sorghum is increasing every year, and it is now grown by a great many. The fruit prospects are fair. The limbs of a great many trees, however, are partly withered, and no cause has been discovered for the mishap. T. M.

NEB., Silver Creek, Merrick Co., July 19.—Wheat is a poor stand on account of early drought. Corn is very good and a great deal was planted. Potatoes are fine. Oats do.; rye medium. Barley not good. Tea, Odessa and Lost Nation are the principal varieties of wheat. Acreage large. Of sorghum none is planted. Our apples include the various crabs, N. Spy, Winesap, Ben Davis, Maiden's Blush. We grow all small fruits, and in fact any fruit that is semi-hardy. Our peaches do not winter-kill, but the present season killed the fruit. Plums, cherries, and small fruits are good. J. H.

N. J., Montclair, Essex Co., July 20.—The rain is falling splendidly to-day. The announcement in my weather note, of May 29th, of the end of our heated term, was premature. It was only the end of the first session. The second session followed immediately ending on the 5th of this month. June goes on record as the hottest and driest month ever experienced here. It surpassed May in temperature, scoring 106 deg. on the 25th. On the 13th a portending shower accompanied by vivid lightning, heavy thunder and high wind, ended with only enough rain to fairly lay the dust. Promises of showers were frequent during the last half of the month but they only inspired our hopes and passed around. A field of corn near me, planted on June 8, did not come up till after the drought ended, July 5, when we had a fine three hours' gentle rain. Now we are having the promise if not the reality of the other extreme, ample rainfalls occurring at intervals of three or four days. Vegetation of all kinds, weeds not excepted, is "booming." Corn has more than doubled its hight since the 4th, and is looking splendid. The light hay crop has been supplemented by a large breadth of corn fodder which since the rains, has come up and promises well Pastures are again looking green and we hope soon to suspend feeding which we had to resort to. Late potatoes look well. Grain is very short in the straw and head, but generally well filled. With economy and a favorable Fall, we hope to bridge over the loss from drought. E. W.

N. Y., Attica, Wyoming Co., July 22.—Our apple crop last season was excessive in yield, but the fruit proved a miserable failure, owing to premature decay, caused by unequal ripening in our super-heated and abnormal atmosphere. However carefully handled, fruit, whether in piles or in the barrel, rotted rapidly, and the little that was saved hardly paid the cost of handling and marketing. This year the trees show a comparatively small yield; the fruit is of imperfect shape and is fast dropping from the trees. Pastures are fair; the hay crop is considerably less than last year. Dairying pays well. S. F.

VT., Middlebury, Addison Co., July 23.—We have had a very warm and dry Spring and Summer. The thermometer has stood at 100 degrees several days. We have had showers occasionally since the first of July. The hay crop was light, only about one half the usual amount. Fall-sown wheat was killed out very badly last Winter. Clawson is the leading variety here. Not much Spring wheat was sowed. Oats are looking nice and are about ready for harvest. Corn promises to be a good crop, and potatoes a fair one. No sorghum is raised in this vicinity. The small-fruit crop was very light on account of the dry weather. There will not be very many apples, as it is not the "bearing" year. W. M. E.

WASH. T'Y., Lopez Island, San Juan Co., July 17.—Crops look well. Not much wheat is raised on this island; although all grains do well here, except corn which cannot be raised to advantage. Potatoes are the main reliance of new settlers. The yield is from three to fifteen tons per acre. No sorghum is grown here. All fruits except peaches and grapes do better than in Pennsylvania or New York, especially small fruits. R. J. H.

WIS., Darlington, Lafayette Co., July 19.—Corn, oats and flax are very promising. Wheat rye and barley are not as good. The first three are much the most largely grown here; the others come in the order named. Interest in the growth of sugar cane is rapidly spreading, but it is not grown much yet. Fruit prospects here were scarcely ever better than now, but we are mostly confined to apples and small fruits. Of apples, Russet, Northern Spy, Ben Davis, Fameuse, Duchess and Astrachan have proved most satisfactory. W. J. B.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

A Native Silk-worm.

A. M. Van A., Fort Howard, Wis., sends a large worm which he found on a gooseberry bush, and asks for its name.

ANS.—The larva was received alive, though rather starved from its long journey without food. It is the larva of a native silk-moth known as Attacus Ceeropia. It belongs to the family Bombycidæ, and is among the largest of our insects, the larva measuring three inches or more when full-grown, and the moth expanding its wings five and a half to six inches. The larva is a great feeder and is found on apple, cherry, plum, oak and elm trees, and sometimes on currant, gooseberry and barberry bushes, during July and August. At first the young worm is of a deep yellow color, with black warts on the back, but it gradually changes to a clear, light green. On each of the second and third rings are two large, globular, coral-red warts, and on each of the seven following rings are two yellow warts, with a single larger one on the eleventh ring. On each side of the body are two rows of light blue warts, and an additional short row below them along the first five rings. In early September this caterpillar spins a cocoon about three inches long, of strong, yellow-brown silk, and it remains in this form till the following June, when the moth appears, mates and lays its eggs, which again go through the same cycle of changes. If they were numerous they would be quite destructive, but they are happily found in small numbers.

Miscellaneous.

T. S. G., St. Johnsville, N. Y., asks which of the following strawberries are the best: Crescent Seedling, Downing, Great American, Forest Rose, Monarch of the West, and are there any better; 2, which are the best Black-cap raspberries and the best blackberries? His land is a sandy loam and muck on a level bottom in a valley; 3, what new kinds of fruit trees and plants would be likely to do well there?

ANS.—We have during the present year given in our columns very explicit information respecting the kinds inquired about, and engravings and descriptions were presented last year. Our friend is referred, therefore, to back numbers for detailed information. The present issue also contains much information on the subject. Crescent Seedling is prolific. The berry is soft and of poor quality. Charles Downing is excellent in every way. Great American is generally a failure. Forest Rose is large, firm, and of good flavor. Monarch of the West is an old sort, but excellent in every way. There are few of the newer varieties which will equal it in size, quality, productiveness or adaptability to different soils and situations. 2. Gregg is a new and first-rate Black-cap. Try the Snyder and Taylor blackberries. They are productive and hardy. Of the better-known kinds Kittatinny is the best. 3. As to "trees and plants," our inquirer must consult our columns from week to week. Everything new and at all meritorious is placed before the reader, oftentimes with engravings from life.

M. A. H. B., Plymouth Union, Vt., has two tea plants and an orange tree, and he wants to know how to cultivate them and how to cure the tea leaves.

ANS.—Orange trees and tea plants cannot be grown in the North except in a green-house, and then they will have no value otherwise than as curiosities and for ornament. The curing of tea leaves is an intricate process, which requires experience and special apparatus to make it a success, and it would hardly be justifiable to procure these necessities for the crop of two small plants. The culture in the green-house of the two kinds of plants is much the same. Keep them in about 55 deg. to 60 deg. F. in winter and transplant to larger pots in the Spring when needed. Give moderately rich soil, and keep them clean of scales.

S. O., Aiken, S. C., asks what is the best time to sow canary seed?

ANS.—Canary grass yields from 30 to 40 bushels of seed per acre. When it is young cattle eat it, but as it is an annual and not a luxuriant grower, it is not much valued as a fodder crop, but is mainly grown for its seed for bird feed. It should be planted early in Spring in the above section.

O. M. T., Orland Ind., asks how peanuts should be cultivated and raised; his soil is a sandy loam, and he thinks it would be well adapted for their growth.

ANS.—We have answered this query so often of late that we will refer our friend to pages 59, 218 and 490 of the RURAL for 1879, and to page 299 of the current volume.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, AUG. 7, 1880.

FINAL NOTICE.

THE next Fair Edition of the RURAL NEW-YORKER will be issued about September 1st. Instead of 28, as in our last Fair number, it will consist of 40 pages with cover, original engravings and articles written expressly for it by Dr. J. B. Lawes, of Rothamsted, A. B. Allen, William Robinson, founder and editor of the London Garden, Professor F. H. Storer, Peter B. Mead, Gov. R. W. Furnas, Prof. E. W. Stewart, B. F. Johnson, Henry Stewart and by others, perhaps, whose names we are not at present prepared to announce. It will contain a full account of our next Free Plant and Seed Distribution which we deem of greater value than any previously offered. It will contain our Premium List for 1881 together with other matter which it would be premature further to particularize now. Respectful notice is hereby given to advertisers that we cannot insure the insertion of advertisements in that number unless the copy is received before August 15, or possibly August 10th. We *guarantee* that the edition shall be over 100,000 copies. The greater part, after serving our subscribers, will be distributed at the most important of the Fall fairs. Our regular subscribers are freely invited to send for as many copies as they may be willing to distribute among those who are interested in rural affairs. All the friends of the RURAL NEW-YORKER, who are satisfied with the efforts we have made to please and instruct them, are solicited to aid us, through this Fair number, in so extending our circulation that further improvements may be inaugurated and sustained during 1881.

A LETTER which we have just received from Dr. Lawes (Rothamsted) under date July 16, says: "We are suffering very much from wet, and the floods in my part of England are as bad as they were in July, 1875. Unless we have a change shortly our wheat crop will be much injured."

HOW TO APPLY LONDON-PURPLE.—Most persons who have tried London-purple mixed with water and with flour or plaster, prefer the latter. It needs no stirring and is far more quickly applied and evenly distributed. During the present season we have used London-purple in preference to Paris-green, for the reasons that it is just as destructive to the beetles or their grubs, while a given quantity costs less and goes further.

To mix the Purple with flour or plaster, we adopt the following plan: A half-barrel of the plaster (or flour) is mixed at once, being as large a quantity as can be handled conveniently at one time. This is spread about three inches deep upon a tight floor. The Purple is then sprinkled over the entire surface in sufficient quantity and an iron-tooth rake is used to mix them together. The rake readily makes its way through the mass of plaster, on account of the slight resistance it offers, and a thorough admixture is thus effected in a few minutes. As to the quantity of Purple, we use about one quart to a barrel of plaster. If used stronger than this it will kill the leaves. A very good guide as to strength is this: Use London-purple enough to color the plaster a just perceptible tint of lilac. A barrel of plaster thus prepared suffices to dust thoroughly a half-acre of vines when the beetles and grubs are so numerous as to be found upon every leaf.

BAILEY'S MAMMOTH ENSILAGE SEED CORN.

MR. JOHN M. BAILEY'S "Book of Ensilage," which we have just received for notice, has an imprint on the cover and also on the first leaf of a remarkably vigorous corn plant as a specimen of a variety which he is pleased to call "Mammoth Ensilage Seed Corn." He further says that "The Mammoth Ensilage Corn yields from 40 to 75 tons of green fodder per acre," etc., and exhorts the public to send for price lists. The fact is that it is none other than Blount's White Prolific Corn, which the RURAL NEW-YORKER distributed among its subscribers last year, and the engraving in the "Book of Ensilage" is an exact reproduction (except in size) of a stalk of this corn, which was engraved by us and first published in the RURAL of March 8th, 1879. We subsequently permitted a couple of seedsmen to use the engraving, but we should be pleased to know what right the author of "The Book of Ensilage" has to adopt this cut and change the name of the variety from Blount's White Prolific to that of Mammoth Ensilage Seed Corn. As to the value of the system of ensilage, our opinion has already been expressed in the RURAL.

PORTABLE FARM STEAM ENGINES.

As the use of these is constantly increasing for various purposes on the farm, and in barns for cutting up and preparing fodder, the same attention ought to be bestowed in the practical education of the men managing them, as is done on that of those employed on railroads and steamboats. In England employers are very particular as to the qualifications of the drivers of portable farm engines for plowing, etc. Each driver is obliged to certify that no accident has ever happened to the engine or its attendants during a period of not less than 18 months of previous service, and, in addition to this, the engine and driver are inspected by a professional examiner and inspector. It is but a few weeks since we saw a report in the papers of the bursting of the boiler of a farm engine, and the man sent out by its manufacturers to set up and start it, was instantly killed, and several spectators standing about were badly wounded. In years past there have been various accidents from farm engines; but we do not recollect whether any, except the one above, was fatal. An explosion in a barn filled with hay and straw and attached to stables of cattle and horses, would be attended with great loss of property and animals, and perhaps sometimes of human life. Manufacturers should not only thoroughly try their engines and boilers before sending them out, but allow no one to go with them unless of tried competency in their management besides being strictly faithful and perfectly sober in all his habits.

CLEAN CEREAL FOOD.

WHILE ingenuity seems almost to have exhausted itself in devices to secure the entire purification of the grain of wheat before it is ground into fine flour, it is strange that so little care is taken with other grains in the preparation for bread-making. Even wheat designed for "Graham" flour is rarely cleansed as it ought to be, and it is notorious that for this kind of flour the lower grades of wheat are commonly used. When it comes to rye and buckwheat, and especially to corn, we may say that they are, as a rule, ground in their filth, original and acquired, and so come to the table for human food. Wheat must be cleansed to make white flour. This whiteness is a prime element in the price, and therefore of main consequence to the miller. The cleanliness or otherwise of other flours and meals is not so manifest to the eye of the purchaser, and the millers handle them as though it made no difference what is ground up with the grain. This fact is known to many, and prevents them from eating what they would otherwise regard as wholesome and agreeable food. The extent to which this disregard of cleanliness concerning an important class of our food materials is carried, is so great that it is often detected by the taste, and people who are fond of bread made from the coarse meals are given a disgust towards them which endures through life.

It is difficult to designate a remedy for an evil like this, so far as the people of towns and cities are concerned; but farmers carrying their own "grists" to mill can inaugurate the reform by insisting upon the thorough cleansing of all grain before grinding. If they will do this they will establish a standard and secure a general use of the proper apparatus in all custom mills, which will extend in time to merchant mills, and be a wonderful boon to all bread eaters.

A CHANGE NEEDED IN OUR LAND LAWS.

UNDER our present laws the public domain is classified as mineral, coal, timber, and agricultural land. Under the last head is included arid pasturage which at present is worthless, or nearly so, for farming purposes, but well suited for stock ranges. Vast tracts of such land lie west of Kansas and Nebraska, extending through Colorado and New Mexico to the Rocky Mountains. Next to the Texan prairies these plains are the main stock pasturages of the country, and the number of animals raised upon them is rapidly increasing. Through a great deal of this region a more or less bitter strife exists between the stockmen and homesteaders. The former insist that the country is unsuitable for ordinary farm purposes, and that it should be reserved exclusively for pasturage, and should be sold in extensive tracts to cattle raisers, while the latter maintain that the success which has already attended the efforts of our pioneers in reclaiming the "Great American Desert" goes strongly to show that almost the whole region can in time be fitted for farming purposes.

Under the present laws these lands cannot be disposed of to individuals in quantities larger than tracts of 160 acres; nor can they be leased to them. Many of them, however, have appropriated large areas on which they have sunk wells, built fences and constructed various other improvements. Last week one of these firms wrote to the Land Office in Washington urging the importance and necessity of legislation for the purpose of protecting large stock-breeders who, without legal sanction, have taken up extensive tracts on the arid Western plains. On the northern edge of the Staked Plains, in New Mexico, the writers have established a cattle ranch of 100 square miles, or 64,000 acres, around which they have built a fence, besides digging wells and making other improvements on it, and they now urge legislation to confirm them in their squatter sovereignty, complaining that several ranchmen threaten to cut down their fences and let their cattle out, inasmuch as they have no title to the land.

It is not in that section alone, but also in Texas, California, and Oregon, that ill-blood between the large stock raisers and agricultural settlers has caused and is causing a great deal of exasperation and loss to both parties. It seems to us that there is pressing need of some legislation to meet such cases. These cattle kings are in the habit of maintaining their illegal appropriations of the public domain often in the most high-handed and arbitrary manner, and it is only the steady pressure of the constantly increasing number of farming settlers that can check their greed. Even as it is, unless a change is soon made in the homestead laws, the entire region between the hundredth meridian and the Rocky Mountains will eventually be controlled by the great cattle kings. Already, by a round-about way, they have managed to obtain a large share of the best part of it, and more is constantly falling into their hands.

The means to this end are generally as follows: The stock raisers hire—ex-soldiers if possible—with the understanding that they must each homestead a quarter of a section of bottom land along the river front, or land watered by natural springs, and after having obtained their patents therefor sell their homesteads to their employers for a small sum. By the land laws the soldier is allowed to deduct the term of his service from the five years that it is necessary to live on the claim to secure a Government patent, so that frequently the ex-soldier has had to live on the land for only from six to twelve months before he secured his land and deeded it to his employer. This abuse has been repeated by other soldiers, the stock raiser always securing land including living water, so that to-day in some sections of Colorado and New Mexico every river, creek and spring is in the hands of these men. They build wire fences around their possessions, allow no cattle except their own to drink, and thus actually control the adjoining range. While enjoying all the advantages of ownership of thousands of acres, they pay taxes only on the land under fence.

If the Western plains here referred to are neither fit nor can be fitted for general agricultural purposes, the fact should be speedily ascertained beyond cavil, and the land laws should be so altered as to enable stock raisers to purchase or lease the large ranges their business seems to demand to secure the best results. If, on the other hand, the advance of cultivation westward is likely to fit a great part, if not all, of this vast area for agriculture, as it has already done in some parts of the whilom American Desert, then the homestead laws should be promptly altered to prevent the abuse of their privilege by which the best portions of that country are being monopolized by a handful of wealthy stock-owners and speculators. In any case an early change in our land laws seems needed.

BREVITIES.

NELSON RITTER'S report of the Beauty of Hebron (in another column) is a specimen of many we are receiving.

OF our eleven varieties of cow-peas, that known as "Poor Land" has, up to this time, made the best growth. It was also the first to bloom.

WE have just received too late for this issue, a full account of the British Royal Agricultural Society's Great Annual Show, held at Carlisle, England, on July the 12th.

WE should like to have every farmer read the article by Richard Goodman, on page 503. It starts off like a thrice-told tale. Indeed, it is upon a threadbare topic—but the dress is new and striking.

MR. JAMES HOGG informs us that we do not know how best to prepare a musk-melon. Cut it in halves, he says, and after taking out the seeds, spread a little honey over the flesh, and eat with a teaspoon.

IN England it has been found that seven pounds of sulphur mixed with 100 pounds of ground bone and allowed to slightly ferment for a few days before being applied to the soil, will effectually defend the young turnip plants from the attacks of the fly.

IN Spain the Lemon verbena is considered as one of the best tonics and stomachics. It is used in two ways—either made into an infusion or decoction, with hot water and sugar and then drank cold; or five or six leaves are put into a cup of hot tea. It is used as a remedy for flatulence, nervousness, diarrhea and loss of appetite. The flavor is very agreeable.

FROM a valued correspondent in Bradford Co., Florida, we have received a package containing specimens of cow-peas planted the second week in May, and gathered June, 25, and a small bunch of Bermuda grass reported to contain seed. The peas average seven inches in length with an average of 22 seeds. We are afraid the spikes of Bermuda grass do not contain any true seeds.

WHILE noting the merits of the many new strawberries that claim attention, the value of such sorts as Seth Boyden (Boyden's 30) should not be forgotten. The berries are very large sweet and quite firm. Charles Downing, Boyden and Sharpless are among the very best for home use. Pot-grown berries (if *well* grown), planted before September, will produce a fine crop next year."

THUS touchingly writes the Editor of the Mark Lane Express: "The consumers of agricultural produce may be comforted by the good crop promised and to a considerable extent gathered in the United States; but this only adds to the depression of the British farmer. In the households of our homesteads, which look so snug and comfortable, there is deep sadness to day, and many a brave heart is about broken.

"A QUICK and effectual method to destroy plantain and other weed pests on lawns is to cut the plant off at the crown, and drop on the top of the root two or three drops of kerosene oil. The lawn will not be defaced by digging, and the work is at once and completely done; the root dies as surely as if struck by lightning."

IT is the strangest thing that the above or similar advice is going the rounds of the Agricultural press. In wet weather plaintain may be pulled by hand, roots and all, as clean as a whistle, if all the leaves be held in the hand when the pull is made. But at any time this pest may be grupped up with a forked iron of almost any kind so rapidly that nobody would ever dream of adopting the above fussy, silly method.

A NEW YORK CITY contemporary takes a Boston daily paper to task for saying that the Ox-eye daisy is propagated only, by seed. It points out that the daisy is a perennial, and then states that it is *only* by persistent cutting that it can be subdued. It is a perennial plant, certainly; but this method or exterminating the weed is altogether impracticable, as any farmer knows that has had it to subdue. A part of an old pasture field at the RURAL FARM, that was infested with Ox-eye daisy, was plowed last year about the 1st of July, while the daisies were in full bloom. The roots were thus exposed to the hot sun during a dry time, and at once killed, while the forming seeds were buried beneath the furrows. City editors must think that farmers have very little to do when they advise them to "persistently cut back" such weeds as the Ox-eye daisy. The part of the field thus plowed remained bare during the rest of the season, and the entire field was planted to corn this Spring. It is noteworthy that the corn on the part of the field plowed in July and again in the Spring, is at least one foot taller than that on the other portions plowed only in the Spring.

THE Board of Control of the New York State Experiment Station at its meeting on August 4th, will appoint a Director and Chemist for the Station. The value of the institution to the farmers of the State will depend mainly on the character and qualifications of these officers, and it is, therefore, of no small importance that able and trustworthy men should be selected for the positions. They should be men whose work has already made them favorably known to the public. The institution at present, is itself an experiment, and there should not be anything experimental about the qualifications of those upon whose skill, application, and integrity its success depends. As it is intended to make a number of experiments in practical agriculture, we trust that some sagacious, practical agriculturist may be selected as Director, while for the chemical work we are fortunate in having at hand, in Dr. Ledoux, late Director of the North Carolina Experiment Station, a man who has already greatly distinguished himself in that very line. Should the chemical work of the Station be confided to him, we feel assured from careful observations of his labors in North Carolina, that the public will be well and faithfully served, and that a long step will have been taken towards rendering the Experiment Station a success.

For Women.

CONDUCTED BY MISS RAY CLARK.

"JE VOUS AIME."

CHARLES RICHARDS DODGE.

I.

"I LOVE YOU" sighs the roving bee
To the wild, red rose; and daintily
The belted knight bends low and sips
The nectar from her crimson lips,
And laughs that love is so free.

II.

"I love you," sighs the wild red rose
To the sunbeam, as it fondly throws
Her a love-kiss, tender and true;
And it answers, "I love you."

III.

"I love you," sighs a bashful boy
To a blushing maid—so shy and coy—
Yet happy that love is so free.
And the sunbeam and the truant bee
Breathe in his ear those words of joy
The maiden durst not, "I love *thee*."

RECREATION.

VELENA.

AWAY from the heat, the noise and the dust, to cool, quiet and shady retreats, the people of the city are hying. Not alone for pleasure, but the health of many require this change.

The overworked brain and worn-out nerves have lost their tension and they demand a respite, a rec-reation and a re-creation.

All day in close, ill-ventilated rooms, breathing dust from manufacturing tools of iron or brass, or bending over writing desks inhaling air laden with gas and various odors, is it a wonder that heart and lungs cry for a change? In truth, the whole system demands pure air, pure water, pure food and wholesome rest. The monotonous routine of life, whether one of continued activity or dull sluggishness must be broken into, to keep the health of brain and body unimpaired.

Too long a strain, as well as a want of proper exercise, produces flabbiness of the muscles. Too constant use of the mind lessens its strength and weakens the brain; and using it but little, or not at all, produces the same result.

Both too much exercise or too little should equally be avoided. Every body should work both mind and body a certain length of time and then should rest in order to keep both healthy and in tone.

FIG. 256.

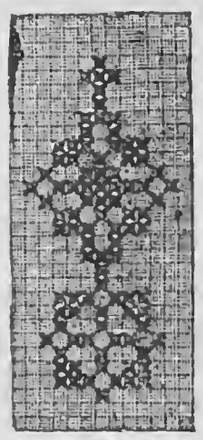

FIG. 257.

For how long a time, or to what extent, depends upon the actual strength of the person. It is not always necessary that there should be an actual cessation of duties, but there should be an avoidance of continued monotonous labor.

An occasional hour or abandoning all work, all care and forgetting all sorrow and pain is conducive to health, to strength and to labor. A change of place and a change of associations are untold helps in many and varied ways.

Even slight changes have their effects; one can hardly be too young, nor can he well be too old not to appreciate a pleasant change even though it be for but a short time.

What these changes must be, to result the most beneficially, depends upon the habits and employments of the different ones.

Those residing in rural districts ought to have rest and recreation, but the air they breathe, the water they drink and the food they consume are comparatively pure. With them noise is an exception. There is no rumbling or clattering of wheels going round over stone pavements; no buzzing and whirring of machinery distracting almost to insanity the tired brain; no thrilling the strained nerves with intense vibrations causing extreme pain. These are unknown and unfelt in quiet, balmy country retreats. The soothing power of sylvan glades, the hushed and fragrant air restore only over-wrought humanity Those to whom it is an every-day and a life-long enjoyment ought occasionally, to taste the hurried, busy and cramped life in the heat and dust of a town, in order to fully appreciate the blessings at their door.

Not that farmers do not feel the heat, dust noise and labor almost incessantly, but they *can* stop off in the "cool and quiet;" while for people in the town there is neither the cool nor the quiet to be had.

They must go from home for it, and it is to urge the making of arrangements for this most beneficial recreation that I agitate the subject. Parents need rest and children require a change.

Do not make expensive preparations nor go to popular and expensive resorts, but find a place and at such prices as you can well afford, and enjoy it a week.

We could all recreate more if we would do it more wisely.

If we would only be healthy and clean and content, we could rusticate with as much pleasure at a dollar a day as some do for five. In fact, many camp out at much less cost and have as good a time as they ever had, providing they do it "wisely and well."

DESCRIPTION OF CUTS.

FIG. 258.—FASHIONABLE FANS.—The larger fan is of feathers, with small flowers introduced; it is mounted on satinwood. The smaller fan shuts into a case; it is intended for out-door use.

FIG. 258.

FIG. 259.—WORK-BASKET.—Any wicker basket may be used for this purpose. It is covered with cashmere and is ornamented with cloth drapery, each section of which is embroidered with a bouquet of roses and lilac, or the bouquet may be made of flowers composed of narrow China ribbon, the leaves being embroidered; a bouquet is also worked in the center of the lid, which is ornamented with a cord and ruche of narrow ribbon; ball-wave fringe finishes the drapes.

FIG. 256.—DRESS SLEEVE.—The sleeve is suitable for a home-dress of cashmere or other material, it is ornamented with a gathered cuff of silk and a bow of ribbon.

FIG. 257. 260 and 261.—BORDERS IN CROSS AND ITALIAN STITCH.—For handkerchiefs, children's washing-dresses, &c. The border may be worked in ingrain cotton or washing floss, in colors to suit the material it is intended to ornament.

MAKING WORK EASIER.

IT is a delightful thing to see a household managed in a methodical manner, when there is no fuss made about it; when the wheels and pulleys that move the well-ordered machine are kept so much out of sight, that nobody is disturbed by them, and kept in fear lest she shall in some way disarrange their working.

There are houses where a kind of State prison system prevails, which is very irksome to all who come within its sphere; but the art that hides art is the perfection of good housekeeping. You see the pleasing results and that is all you know about it.

Household work is carried on with much greater ease where this quiet order is found. No hunting for this, or that, because everything is in its place. No flutter when company comes unexpectedly, because there is no place fit to receive them. The darkened sitting-room is thrown open to the light, and they are ushered in to its cool, inviting atmosphere, and the housekeeper can sit down and entertain them without an uneasy consciousness that the corners are all in confusion.

We all have gifts differing, but there is no one but can improve an original defect in character and training, if she have but the real heart for it.

While children are small, and there are many about a house, it is seldom possible to adjust matters with great regularity; even very orderly women find their souls vexed and harassed unduly from day to day, because of repeated failures.

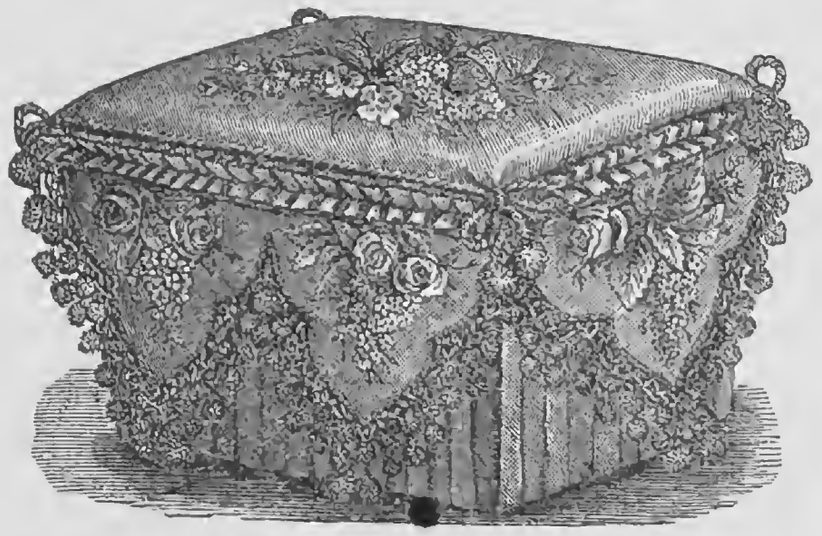

FIG 259.

It is a good thing to strive often and keep steadily before the mind, the necessity of system. It is but little more trouble, in the first place, to hang up a garment, than to throw it over a chair, and it saves a great deal of trouble afterwards. It must be hung up eventually and has, very likely, become rumpled, and needs ironing, or soiled, and needs brushing, caused by the want of care at first. It has also been in the way for hours. How easy to have saved it all!

It seems an odd way but I have known a woman, of over-burdened with work either, who would leave her stockings unassorted and unmended until somebody wanted a pair, and then there was a flurry and hunt for needles and darning cotton, and not a pair of shears or scissors to be found in the whole house. Very likely she would sit down to darn them with a case knife in her lap, with which to cut the thread.

It was the same way all through the house.

I have seen her little girl trotting around with one black and one white kid shoe on; but then her stockings were of different kinds so they matched pretty well.

Attention to little things just as you go along, will save a great deal of time, labor and confusion afterwards.

It will give you courage, too, and that is worth a great deal to a soldier, who has a hard battle to fight. It is inspiring to think "that is well done," even if it is so small a matter as polishing your tea-kettle, and it will give pleasure and courage every time your eye rests on it. EDITH.

HUSBANDS AND WIVES.

M. J. T.

I AM writing to welcome Miss Irene to our Women's Columns. That she brings a vigorous mind and strength to wield the pen cannot be doubted. Nor do I question but that she speaks truly as well as feelingly on the wrongs of some wives she knows and probably loves, still, as an old wife myself, I have no faith in publicly dressing down our husbands.

Unfortunately, there are men, who, having led their wives to the altar, act as though they thought by giving the woman their name they had performed the last act of courtesy to be expected from them, but there is only a small proportion of this class, and even toward them we as Christians must remember to exercise that charity described by St. Paul, "which suffereth long and is kind." Then we must also remember that it is very possible the wife falls below the ideal that her husband formed of her character, just as the same experience is realized by the wife.

One thought has often occurred to me, that the temper of the contracting parties ought to be seriously considered. The old lady who asserted that temper was everything, was nearer the truth than many may suppose. A man of phlegmatic temperament can hardly conceive the pain that his indifferenec will give to a sensitive wife.

It is true that workingmen's wives are too often overworked. In many cases, however, it seems impossible to avoid it, and when weariness comes the temper fails, and we see only the hard side of our lot; but let the weary ones remember the promise: "As thy days, so shall thy strength be." The thought will do good, and the children will soon grow to be a help and comfort. Let us try to teach the young people to be courteous to one another; that will help to make good, thoughtful husbands and wives for the future.

As for Miss Irene, when the right man comes, I feel sure that she will have his supper ready by the time he comes home, so that he will only have to play with baby while she clears it away.

WORLDLY MATTERS FOR GIRLS.

Teeth.

Lately, dentistry has become so perfected that no excuse can be given by anyone for unsightly teeth; no lady or gentleman will neglect them, any more than they would be guilty of appearing in company with uncombed hair.

Make it a rule to have a dentist examine your teeth at least two or three times a year. Have the back ones filled with amalgam and those in front with gold. The amalgam will last just as long but does not look as well as the gold fillings. After they are filled take care of them; use a tooth brush with a—tufted end, convex in shape—this kind of a brush is better than an ordinary one because it can penetrate parts of the teeth that you cannot touch with another kind of brush; clean them twice a day and oftener if possible. Use a powder (recommended by a good dentist) or white castile soap; brush the front ones *lengthwise* and be as particular in cleaning the inside as the outside of the teeth. Once a day run linen or silk floss between them, this is the best preventive known for decay between the teeth.

If you find in spite of all this care that tartar is forming, get some powdered pumice-stone, take a match with the sulphur end bitten off, make the end bushy, wet it, dip it in the powder and rub it across the teeth lengthwise, gently until the tartar disappears.

For a foul breath wash the mouth out with carbolic acid, diluted in water, and lemons eaten occasionally. The latter, however, is not very good for the teeth. Miss M. D.

SCARE-CROWS.

No sort of use in hanging out such looking things, to keep birds out of the cherry trees, or the crows from the corn fields. Birds aren't fools they have sharp eyes, and see through such shams quicker than human beings do. Why I have seen effigies stuck up in the corn-field that would scare a horse, and make a boy jump, and the crows would come and pull the corn, without a sign of fear. I tell you it is not an easy matter to cheat birds; they will not be humbugged by old clothes, or hooped skirts; they are too sensible for that. Now if you want to keep birds from trespassing, just drive up stakes in the corn-field, and tie a string around the necks of some glass junk bottles, and hang them on the top of the stakes or on the limbs of the trees. Birds are shy of bottles, they show a deal of good sense in it too.

There is danger in bottles, and birds keep clear of them. They never go near them, and it is the best use one can put them to. GRANDMOTHER.

FIG. 261.

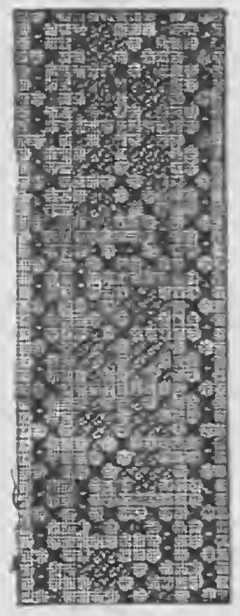

FIG. 260.

DIMPLES TO ORDER.—A New York paper heralds a manufacturer of dimples, who comes from Paris, of course, and whose *modus operandi* is described as follows: "I make a puncture in the skin at the point where the dimple is required that cannot be noticed when it has healed, and with a very delicate instrument I remove a slight portion of the muscle. Then I excite a slight inflammation, which attaches the skin to the subcutaneous hollow I have formed. In a few days the wound—if wound it can be called—has healed, and a charming dimple is the result."

BE TIDY.—"Now, my son," said a kind mother to her little boy, "be tidy, fold up your nightgown *again*: I *must* have it done *neatly*."

That boy has grown up to be a man. A friend said to him one day

"How is it you get through so much work as you do?"

"Method, method," was the reply. "I am now reaping the fruits of my mother's lesson—'Be tidy!'"

TO WASH A MUSLIN DRESS.—Make a good lather, and wash the muslin in *cold* water—never putting it into warm water even to rinse it. If the muslin is green, add a wineglassful of vinegar to the water in which it is rinsed; if lilac, the same quantity of ammonia. For black and white muslins use a small quantity of sugar of lead.

DR. JOHNSON once said in his bluff way, that want of economy was a kind of dishonesty. Certain it is, the improvident man robs himself, and his punishment is sure to be painful if not public.

GOOD temper is like a sunny day, it sheds a brightness over everything; it is the sweetener of toil, and the soother of disquietude.

CORRESPONDENTS' CORNER.

WILL Miss M. D. please tell us where "London Hair Restorer" may be obtained? I have failed to find it at any of the druggists where I reside.

McKean Co., Pa. BELLE W. H.

Literary Miscellany.

LOFTS.

BY PAUL PASTNOR.

Do you remember when we were boys,
And used to sleep so near the sky?
Ah! life was a housetop-hight of joys,
When you and I were country boys
And used to sleep so near the sky!

How sweet and cosy the attic seemed,
When, weary-limbed, we stole to bed,
The drowsy candle sank and streamed,
The starlight through the shingles gleamed,
And all things dim to slumber wed.

Then, as in reverent prayer we knelt,
The figures on the counterpane
How strangely into speech would melt:
They seemed to utter what we felt
In some fantastic, far-off strain.

Oh, what was e'er so warm and soft
As the humble cot we used to seek?
Bright dreams, that gently stirred and oft
The fragrant stillness of the loft,
Did brood us, like a mother's cheek.

The swallows twittered under the eaves,
The old clock struck the solemn hour,
Yet we never woke till the dewy leaves
Sifted the dawn thro' their sparkling sieves
Into the garners of the flowers.

Ah well! all this was long ago,
And mists of time lie thick between.
Already our locks are too white with snow,
And it wouldn't do to sleep, you know,
Where the frosty stars look in!

But somethne, brother, a night will come,
When we shall ascend the flickering stair,
And sleep as sweetly in God's great home,
As though we had only laid us down,
And tucked us in with a quilt of prayer.

EDWARD BENTLEY'S DECISION.

CHAPTER II.

THOUGH slightly fatigued with their walk, neither of the young girls felt inclined to follow the example of the servants and go to rest. Their feet were damp with the dew, and, Em, complaining of being chilly, set light to the fire, which was always laid in readiness, the Rector having a huge dislike to an empty grate after sundown; declaring that even in the dog-days a room looked comfortless without a cheery blaze.

Drawing an Indian screen between their chairs and the door, Edith Wilton and her friend sat with their feet on the fender, talking by fits and starts, till Em fell from musing into slumber.

Edith did not disturb her, for she, too, had fallen into a reverie, and was half sadly contrasting the peaceful life of her schoolfellow with her own.

The few days she proposed spending at the rectory were a blissful respite from the exactions of the querulous, irritable woman, who, while professing to love and treat her as her own child, contrived to try her patience continually, and was now urging her to marry a subaltern in her husband's regiment, whose wealth blinded her to his want of brains.

Major Wilton might have helped his niece, but he had taken it into his head that little Edith would be better off as a wife than under the domination of her aunt; and as he could not understand her scruples, she refrained from teasing him with them.

The lamp having been so badly trimmed that it smoked intolerably, Em had extinguished it as soon as she lit the fire; and when that began to die out the room grew very dark. Myers, peeping in, and finding no light and hearing no sound, concluded that the young ladies had gone up stairs long since, and went his own way in false security.

From a very pleasant dream, in which she was bestowing more rosebuds on Leonard Clinton, Em awoke with a start and a shiver, and gently reproached her companion for not having aroused her sooner. But Edith only laughed; declaring that she was accustomed to late hours, and had been too comfortable herself to care to stir.

Lighting a taper that stood on the mantel-piece, Em now led the way from the room. The hands of the tall clock (not my grandfather's) that stood in the hall, were pointing to the half-hour after midnight, and the measured ticking sounded so ominous in the silence of the night, that, involuntarily the young girls stepped more lightly, and cast awed glances around them.

Em's foot was on the lower stair, when a sharp click like the turning of a key in a lock, made her pause, and whisper the question:

"What was that?"

Edith shook her head; she too had heard something, but could not tell what.

"Are all your servants in bed?" she queried, in the same hushed tones that her friend had employed.

"Oh! yes; we keep such early hours. It is rarely that anyone is up after ten o'clock."

"But your very civil man Myers may have thought it incumbent on him to wait for us. The sound seemed to proceed from this direction," and Edith pointed to the door of the dining-room, beyond which lay Mr. Bentley's study. "Shall I see if anyone is there?"

Em faltered an assent. Her friend had more courage than she had, for if left to herself, instead of standing still, trying to look calm and brave, she would have rushed upstairs and hid herself under the bed-clothes.

Edith's own face paled slightly as, with a turn of the wrist, she opened the door and looked in. No one was in the dining-room, but there was a light in the study. On the wall were thrown the shadows of two heads—Myers' and another's!

Finding that Edith did not stir, Em ventured to step nearer and peep over her shoulder.

There was a subdued hammering, and then the cracking of wood—sounds which might have perplexed the hearers of them if the Rector's sister, on catching sight of the shadows on the wall, had not divined the errand of the men thus reflected upon it.

"There are thieves in the house!" she exclaimed. "They are breaking open Edward's desk."

Edith's first thought was one of thankfulness that the trust-money was no longer there; but Em was too frightened to find similar comfort. Screaming for help, she flew upstairs; but before following her example, her friend, with more presence of mind, took the precaution to close the dining-room door and fasten it, thus placing a barrier, if but a frail one, between their defenceless selves and the burglars.

In the excess of her terror, Em made for the chamber of her brother, forgetting that he was not there to protect her; and once locked in it, neither she nor Edith dared leave it again, although, as the windows were at the back of the house, there was little or no chance of being able to make their position known to any belated person who might happen to pass by.

And now Em sank on the floor, clinging to her companion, and sobbing out a conviction that they should both be murdered. Always timorous and sensitive, she had become quite helpless in the face of this emergency.

"Hush!" said Edith, almost sternly. "Had you not alarmed these men with your screams, we might have escaped from the house and obtained assistance; but I do not think we have anything more to fear. Thieves are generally cowardly, and these may have taken to their heels as soon as they found that they were detected."

But in this she was mistaken. A crash below proved that they had forced their way out of the dining-room, and the muttering of voices was followed by heavy footsteps ascending the stairs.

"They are coming! It is the money they are in quest of!" gasped Em; "and it is here they will seek for it, now they have satisfied themselves that it is not in the escritoire. Oh! Heaven! what shall we do?"

"Parley with them," said Edith. Assure them that they are making a fruitless search. To let them guess how much we dread them is only to encourage such lawless ruffians to greater violence."

"Who is there? she demanded; and Em could not restrain a faint cry when the voice of Myers—civil, obliging Myers—made reply that he must trouble the young ladies to hand over the little sum of money the Rector left in their charge, as he had a better use for it than dividing it amongst old women.

"The money of which you speak is no longer in the house," Edith replied, speaking as firmly as she could, with the arms of the shivering, moaning Em about her neck.

Myers heard this assertion with incredulous laughter.

"He had taken good care," he said, "that no fat farmers carried it off to the bank; and he knew 'miss' hadn't left the house all day. If it was not given up at once——"

He finished his speech with threats that made their blood run cold, and Edith clutched the arm of her half-fainting companion.

"Rouse yourself, Em; if these wretches break in here, only to be disappointed a second time, they will revenge themselves on us. Are there no weapons in the house with which we might defend ourselves?"

Em looked helplessly round as she faltered a reply.

"Edward has a revolver somewhere; he used to amuse himself with shooting at a mark, but——"

Ere she could say more Edith had caught sight of the pistol hanging above the chimney-piece, and taken it down. But it was not loaded, and she would have thrown it away in despair, if she had not descried a cartridge-box nearly hidden amongst the books and pamphlets, with which some hanging shelves were filled.

She had seen her father handle similar weapons too often not to know what to do with this one; but Em, shrinking from her, gasped an entreaty that she would not attempt to use it.

Edith did not answer, for she was listening to Myers, who with fiercer menaces than before was demanding admission. He was terribly in earnest, and the brave girl trembled for her companion more than herself.

"Is there no escape for us?" she cried, moving to the window and looking out, only to see that the hight from the ground forbade any attempt to lower themselves, even if Em could have been persuaded to attempt it. Then her eye fell on a door, and she threw it open, but it did but lead into a bath-room, and she was resigning herself to the struggle with their assailants that now seemed unavoidable, when she perceived a flight of steep ladder-like steps in the farther corner.

"Em! Em!" she cried excitedly, as she dragged her to the spot, "where will these stairs lead us?—to the servant's rooms? Better to be there than here."

But Em wrung her hands, and hung back, crying:

"It's no use; they only lead to a little turret Edward uses as a smoking-room."

Nevertheless, "Up! up!" cried Edith; "they shall not follow us there!" and half carrying her less courageous friend, she contrived to reach this last asylum from Myers' contaminating touch, just as one vigorous shove from his brawny shoulder burst the door off its hinges and gave admission to him and his surly confederate.

It would have tried the temper of the Rev. Edward Bentley if he could have seen his most treasured possessions tossed over by the baffled Myers, who had felt so sure of finding the money in one of his master's drawers, that when compelled to believe that it was not there he was furious.

Still he insisted that it was in the house, that miss and her friend had it about them; and knowing but too well whither they had flown, he rushed towards the steps, bidding his comrade follow.

Edith's heart beat with suffocating rapidity. Em had slid down beside her quite insensible.

But with the courage of desperation she kept her post at the top of the steps, and presenting the revolver at Myers as he began to ascend them, Edith bade him keep back.

Again his derisive laughter drowned her words.

"You're a very clever young lady, Miss Edith. I've known that a long time, for you and I are old acquaintances; and I owe your uncle a grudge for having me drummed out of his regiment. You may put down your popgun. I happen to know that it isn't loaded; and I'm going to have the rings off your pretty white fingers, and the pearls out of your ears, and by George! I don't know whether Ned and I won't steal a kiss or two off your rosy lips."

"Stand back, or I fire!" exclaimed Edith again, for he was now approaching her rapidly; but unheeding the warning, he took a step nearer.

There was a flash—a report—and the wretched man, with a yell of agony, fell backwards, knocking down his companion in guilt, who, seeing the weapon pointed at himself, fled, muttering curses, and was never seen again.

The pistol dropped from Edith's now nerveless hand, and she sank on her knees beside her unconscious friend, afraid to cast another glance towards the writhing, moaning wretch at the foot of the steps. The consequences of her own deed terrified her; and though the shot had been fired in self-defence, her woman's heart quailed as she whispered to herself:

"Will he die?"

Em recovered consciousness; but only to mingle her hysterical cries with the groans of Myers who was entreating help, and declaring that he should bleed to death if he did not receive it. Edith felt her own senses fleeting, when the sound of footsteps in the lower part of the house was followed by the voice of Leonard Clinton, crying, excitedly: "Miss Bentley, where are you?"

Guided by Edith's responses, he soon found his way to where Myers lay. A couple of Farmer Andrews' carters were with him, and the farmer himself was coming as rapidly as his size would permit. One of Em's maids had been roused from sleep by the screams of her young mistress uttered on discovering Myers and his confederate in the study, and, slipping on some clothes, the girl had escaped from the house by a staircase leading to the offices, and flown for help to the farm on which her father and brother were employed.

A broken leg proved to be the worst of Myer's injuries, and that had been received in his fall from the steps, Edith's shot having merely inflicted a flesh-wound in his arm. He was carried off and handed to the village constables, and the young ladies released from their captivity in the turret.

But Em's nerves had received a shock not easily overcome. The Rev. Edward Bentley had scarcely commenced his business, when he received a summons by telegraph that brought him home in haste.

He was met by Edith Wilton who did her best to reassure him; who forgot all she had herself undergone that she might cheer him with hopeful predictions of Em's speedy recovery.

Nor did her generous efforts relax. For several ensuing weeks she was the household fairy who nursed his sister, took Em's place at the organ and in the schools, and quietly, unobtrusively attended to the creature-comforts of the rector.

He was filled with contrition for the injustice he had done her. Was this thoughtful, intelligent girl, so active, yet so noiseless in her movements, the woman from whom he had fled in disgust?

"We shall miss you dreadfully, Miss Wilton," he said one evening, when, having seen her patient so thoroughly recovered that she was her merry self once more, Edith talked seriously of joining her uncle and aunt.

"You will have to accustom yourself to a greater loss than my society," she replied, with a significant glance at Em, who was standing on the lawn listening with blushing, downcast face to Leonard Clinton.

"Yes, I have received a hint that I must prepare myself to part with my dear little sister, and as Clinton is of good family, and has excellent prospects, I cannot refuse my consent."

"I hope they will be very happy," said Edith, softly.

"Thanks for your good wishes; but have you none to spare for me? Miss Wilton—Edith—why should you leave us! Who is there who loves and appreciates you as I do?"

Having broken the ice Edward Bentley pleaded his cause so ardently that Edith was persuaded to listen and confess that she was not insensible to his growing affection.

"But," she added, "I ought to confess that I came here prepared to dislike you. I felt sure, from Em's description, that I should find you a saucy fellow!"

"And I," laughed Edward, "ran away to avoid you; it is delightful to know that we were both in the wrong. Let us exchange mutual forgiveness, and then you shall write to your uncle and tell him how one terrible night has brought us so closely together that we cannot consent to part again!"

And when Em and her lover joined them the letter was written, and the betrothal ring glistening on Edith's finger.

RECENT LITERATURE.

White Hands and White Hearts. Published by the National Temperance Society and Publication House, by Ernest Gilmore. 12mo, 278 pages, price $1.25.

This is a new and exceedingly interesting book, intended particularly for Sunday-school libraries. It is well written and pure in tone. Among other valuable lessons it shows the need of patience and trust by those engaged in temperance work and for the salvation of others. A deep religious spirit pervades the whole volume, making it specially adapted to Sunday-schools and home reading.

MAGAZINES FOR AUGUST.

PHRENOLOGICAL JOURNAL—CONTENTS:—James A. Garfield, Republican Candidate for President of the United States; Portrait; Chester A. Arthur, Republican Candidate for Vice-President of the United States; Portrait; Studies in Comparative Phrenology—Continued: With Illustrations; Anti-Malthus; or, the Colonization of the whole Earth—Its Normal Destiny; Progress of Phrenological Truth; What I Know about Mosquitoes; Charles C. Frost, Shoemaker and Savant; Portrait; St. Augustine, Illustrated; Phrenology Misinterpreted; The Curse of Civilization; Fashionable Gift-Giving; Physiological Antithesis; Wall Paper in Bedrooms; Seeing at Great Distances; Notes in Science and Agriculture; Editorial Items; Answers to Correspondents; Personal; Wisdom; Mirth; Library Notices; Publishers' Department.

THE AMUSEMENTS OF THE CHILDREN OF THE POOR.—In our walks we are much given to visiting the quarters of our great city where live the poorer of the working classes. Their humble vocations and their modes of adapting themselves to the pinch of want offer very interesting subjects for contemplation. The children, always numerous, in such quarters specially command our attention, for they enlist at once our sympathy for their helpless destitution, and set in motion a current of thought regarding the life of toil and sorrow which the future has in store for the most of them who survive the years of childhood.

But in the most squalid neighborhoods the edge of our sadness has been taken off by scenes of hearty, thorough enjoyment on the part of children there. Despite the filth of the street and the dilapidation of the tenement; despite surroundings of vice and associations of crime, groups of little ones are to be seen playing with all the expressions of delight, and all the innocent abandon of children in the elegant and retired neighborhoods of the well-to-do.

A day or two since we passed through a street in one of the worst parts of the city; the sultry weather had apparently driven all the grown people from their close lodgings to the windows and stoops, while the children in all degrees of dress or undress flocked on sidewalk and street. Here and there a group sat upon the curb engaged in playing "Jack-stones" with those odd-looking little metallic castings which are to be found in the petty stores which exist in the vicinage of the public schools. Now and then I encountered a ring of urchins, who, with hands clasped, were singing a merry-go-round with intense earnestness. On a narrow, creaking stoop we descried a wee colored girl arranging some bits of china on a little bench. She was "setting table," and her mother, we presumed, a tidy-looking young woman, was leaning against the door-jamb observing the child's play with an expression of enjoyment.

We could have counted fully one hundred children within the space of three squares, and all earnestly bent on play. There was noise enough; some were shouting in high keys, as children will when earnestly at play, but we saw not one instance of ill-humor or quarrelsome dispute.

Who could entertain so harsh a temper as to look upon the amusement of these poor children with coldness? To us such scenes encourage the thought of better days in store for them. We somehow associate their little happiness with the character of our national institutions, which afford to the lowest and the poorest opportunities for mental development, and point to fortune, honor, and power as attainments for which poor as well as rich may strive.—Phrenological Journal.

HARPER'S MAGAZINE.—Contents: Robert Burns, A Poem. Illustrated; The Happy Hunting-Ground. Illustrated by Maria R. Oakey; Fish and Men in the Maine Island. Illustrated by M. J. Burns; By Paths in the Mountains. Illustrated by Charles Graham; Henry of Navarre before Paris. A Poem: Illustrated, Fredericks; Mr. Tolman. A Story. Illustrated, by F. G. Church; Martin Summer in the Garden of France. Illustrated; The Cruising Canoe. Illustrated; White Wings, A Yachting Romance. Illustrated; Boat Song. A Poem; Washington Square; A Boating Adventure; Mary Anerly; Editor's Easy Chair; Editor's Literary Record; Editor's Historical Record; Editor's Drawer.

NORTH CAROLINA MOUNTAIN VILLAGES—The awful solitude of the forests is scarcely broken by them. Half of their unpainted, weather-beaten houses are always empty, the inmates having apparently died, or gone farther into these sleepy wildernesses and forgotten to come back. The roads leading to them are always over break-neck precipices and in scandalous disrepair, one generation putting off to another the mending of them. There is always a deserted mica mine on a neighboring hight, shining like a fountain of silver gushing from the rock; there is always a stream which "would give a powerful yield of gold, only we folks don't count much on them on certain ways of makin' a livin'."

There are always one or two families of educated, well-bred people. They have but little money, but they feel the need of it less here than anywhere else in the States. They live in roomy wooden houses, the walls, ceilings, and floors frequently made of a purplish fine-grained poplar, which no Persian carpet or tapestry could rival in beauty; they buy no new books, but they have read the old ones until they are live friends; they never saw a Gerome or a Fortuny, but their windows open on dusky valleys, delicate in beauty as a dream, on rushing water-falls, on rainbow veils of mist floating over dizzy hights; they dress in home-spun, and sit on wooden benches, but knowing nothing of fashions or bric-a-brac, their souls sit at ease and are quiet, and they never feel the aching void of an empty pocket. Our travelers were welcomed to many a room where trunks, the spinning-wheel, and the cooking-stove filled one side, and the bed and a portrait of a Revolutionary ancestor the other,

where flat-irons and silver goblets, Shakespeare and the blacking-brushes, amicably keep company on the mantle-shelf, but in which the fine quick wit and the grave courtesy of their hosts would have dwarfed the stateliest surroundings. REBECCA HARDING DAVIS.—Harper's Magazine.

THE MIDSUMMER SCRIBNER opens with a remarkable frontispiece engraving by Cole, from the famous picture of Savonarola, by Fra Bartolommeo. This portrait accompanies The Plain Story of Savonarola's Life, written by the English wife of the Italian Professor Villari. The paper has illustrations of the tragic life and death of Savonarola, by Mr. Van Schaick, the American artist living in Florence. Another brief summary of a large subject is Richard Henry Dana's Sketch of American Diplomacy. It is of peculiar interest, coming from so competent an authority. Madame Adam (Juliette Lamber), editor of La Nouvelle Revue, the new rival of the "Revue des Deux Mondes," answers philosophically — and favorably — the question "Will the French Republic Last?" The most novel and interesting art feature of the Midsummer Scribner is Philip Gilbert Hamerton's study of Mr. Seymour Haden's Etchings. It has been left to an American magazine to first enter upon the literal illustration of Dickens, by employing artists to look up the original scenes of his stories. The first of this series appears in the August Scribner. The Western Man, by Charles Dudley Warner; The Book of Mormon, by Mrs. Ellen E. Dickinson, fortified by sworn and other testimony, of the origin of the Mormon Bible. A comic operetta, The Sweet o' the Year, words by Nellie G. Cone and music by E. C. Phelps; Albert Rhodes, on American girls who marry foreign titles; an amusing paper by Mr. Rideing, illustrated by Mr. Brennan and others, on The Curiosities of Advertising; An illustrated paper, by Principal Grant, on the Present Position and Outlook of Canada, in a series which has attracted much attention; Further installments of Mr. Schuyler's "Peter the Great" and Mr. Cable's "Grandissimes." Dr. Holland discusses, among other things, "The Legitimate Novel." "Uncle Esek's Wisdom" is a new feature in the Bric-a-Brac department.

ST. NICHOLAS.—An interesting feature of this vacation number of the boys' and girls' magazine is the profusely illustrated article, A Happy Thought for Street Children. Besides the installments of the two serials, by Louisa M. Alcott and Noah Brooks—one dealing with sprightly homelife, the other with boys who form a militia company and have a muster and sham fight—there are several complete short stories. Of these, the most notable are: "Marjorie's Peril," illustrated by McCutcheon; The Fox and the Stork, illustrated by Sheppard, a tale of boy-life, by Susan Coolidge; Why the Black Cat Winked, illustrated by Brennan, and the Coral Castle, a funny narrative, with six comic pictures by Hopkins. There is, also, an illustrated installment of "The Major's Big-Talk Stories," relating anecdotes concerning two curious animals—the Bye-Bye and the Howis Dattorht.

Placer and Gulch Mining for Gold are graphically described by Ernest Ingersoll and illustrated by J. Harrison Mills, and a bright account is given of the Darning-Needle, or dragon-fly.

The pages of large-type reading-matter set apart for very little folk, and the departments of "Jack in the Pulpit," "Letter-Box" and "Riddle-Box," are made attractive with stories, anecdotes, &c. Scattered here and there are many poems, single pictures, and jingles, which fill up eighty pages in a way to make even the rainiest holiday delightful to the children.

APPLETONS' JOURNAL.—Contents:—Edge-Tools (in Two Parts—Part First) by Annie Bothwell; Health at Home—Part third, by B. W. Richardson, M. D; Some Thoughts on Shelley, by Stopford A. Brooke; The Influence of Art in Daily Life, by J. Beavington Atkinson; German Dialect Poets, by W. W. Crane; Michael and I, by Julian Sturgis; The Historical Characters of the Spanish Stage; Landscape Painting, by Sir Robert P. Collier; The Cook's Oracle; Goldwin Smith's Cowper; Swinburne's Songs of the Springtides; Captain Ortis's Booty; A Ballad; by A. Mary F. Robinson; Briefs on Recent Novels; The Undiscovered Country; Odd, or Even? Uncle Jack's Executors; A Stranded Ship; Mrs Beauchamp Brown; Mademoiselle de Mersac; Second Thoughts; Mary Anerley; Reata; What's in a Name? The Duke's Children; The Virginia Bohemians. Editor's Table; Thought Extirpation Process; Literature as Drudgery; Modern Poet as Verse-Makers; Sir Robert P. Collier on Landscape-Painting; Signing Magazine Articles. The present number is a good Summer edition. Its articles instruct, interest and amuse. It is well calculated for the wants of travelers, who, with few exceptions, select one or more of the popular monthlies for entertainment.

ECLECTIC MAGAZINE.—Contents:—Steel Engraving—Portrait of Mr. Gladstone; Fiction—Fair and Foul; On the Method of Zadig: Retrospective Prophecy as a Function of Science; Suicide; Fishing and Fishing Literature; Captain Ortis's Booty: A Ballad; A Princess of the Seventeenth Century; Cabinet-making; White Wings, A Yachting Romance; Harman Blennerhassett; Some Thoughts on Shelley; Her Last Letter; Geology and History; The Days of the Week; Cliff Roses; The Pinch of Wealth; William Ewart Gladstone (with Portrait); Literary Notices; Foreign Literary Notes; Science and Art; Varieties.

IN the early stages of his ministry the celebrated Dr. Strong, of Hartford, preached some time in a neighboring village. One day a committee called upon him to settle with him for his services, and, after stammering a while, signified to him that his further services were not desired. "What does this mean gentlemen?" asked the doctor. "Why," replied the spokesman, with some hesitation, "the people have got the impression that you are inclined to universal salvation." "Gentlemen," answered the doctor, "I never have preached that doctrine; but, if I ever should, I promise to make the people of this town an exception.—*Hartford Post.*

"ABSTEMIOUSLY" and "facetiously" are the only two words in which the vowels follow one another in alphabetical order.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE KITCHEN CLUB TALK—"WASHING."

ANNIE L. JACK.

IT is a week since the Kitchen Club met at "Every-Day House" to discuss the all-important subject of *washing*, which was suggested to us by the elaborate fifty-dollar machine we had examined at the residence of Mrs. Horatio Hupperton, at our last meeting. There was no doubt it did its work well, was a saving of time and labor, but not every one among our members felt able to afford the money it cost or the space it occupied, all not having a separate laundry room. So we agreed to discuss the subject from our different standpoints. Miss McGreggor did not believe in washing-soda, which was sure to make the clothes yellow. She advised a mixture of two pounds of soap dissolved in five gallons of hot water, three tablespoonsful of liquid ammonia, and one of turpentine. This, well beaten together, and the clothes left in for three hours (being previously soaked over-night in cold water) will save time, wear and rubbing. She told us that her first movement on washing mornings was to take the clothes from the water in which they were soaked, and put them into this preparation; the tub is covered, and by the time breakfast is over they are ready for their boil and final washing.

Mrs. Chapman believed in the old-fashioned wash-board and plenty of clean, soft water. She found, however, a wringer of great service and a saving to the strain on the wrists besides doing the work more thoroughly than it could be done by hand. The minister's pale little wife, with a half-repressed sigh, wished there were better inventions for ironing starched clothes, and a young Miss who was said to be engaged to one of the students of a well-known theological college, covered herself with confusion and glory by remarking that she "did not see why ministers should have any law that compelled them to wear white neckties more than other men," at which some of the wiser ones smiled.

We had been sitting in the maple avenue all the time and at this point the amateur laundry-maid came forward and invited us in to the kitchen to see the operation of washing performed by our new machine. It is called the Robbin's Washer and only weighs five pounds, is eight inches long, five wide and one and three-fourths deep. It was placed in position in a flat-bottomed boiler and soon commenced to throw out from the discharge-pipe a stream of water over the clothes at the rate of eight gallons a minute. We put in a quarter of a pound of soap and a piece of borax the size of a hazel-nut. The clothes boiled twenty minutes and several of the members, after they were taken out, tried how easily the finishing process was gone through of washing out and turning. Then with the aid of a wringer the rinsing is made easy. My "washer" has proved very valuable this season, and saved us many a weary rubbing, proving a veritable good fairy. It pleased the members to see the process, and yet so grasping is woman's nature for something more, that we parted after tea echoing the minister's little wife's wish for "something to iron starched clothes."

KEEPING CANNED FRUIT.

I HAVE just opened an overlooked can of peaches which was not less than six years old, and the fruit was perfect. Is there any limit to the keeping of properly canned fruit? And as regards keeping in tin, is there any proof whatever that acid fruits in air-tight cans ever act upon the metal? I took particular notice in regard to this point, and found that there was not the slightest evidence to the taste, in these peaches, of the presence of any metallic salts, nor was there the least corrosion of the inside of the can, either of the tin or the solder. And yet I see it frequently stated that "acid fruit will not be healthful if preserved in tin." As applied to air-tight tins, I believe this to be an error. T. H. HOSKINS, M.D.

DOMESTIC RECIPES.

Canned Peaches.

Make a sirup of six pints of water and seven pounds of sugar. Do not boil down; merely dissolve the sugar. Peel and halve the fruit—I prefer the late, yellow peach—fill glass cans, cover with the cooled sirup, lay on the tops but do not tighten, set into a boiler of cold water, bring to the boiling point, note the time and boil 20 minutes. Remove and make air-tight.

Tomato Catsup.

Wash and *wipe* (this to prevent the addition of any liquid) one bushel of just ripe tomatoes, cut into pieces and put over the fire to heat. When cooked sufficiently to strain put through a fine sieve. Allow two ounces each of whole black pepper, cloves and allspice—then tie in a thin muslin bag—add one ounce each of ground mace and cinnamon, a teaspoonful of cayenne pepper and a cupful and a half of salt, stirring the ground spice into the tomatoes. Boil until reduced a little more than one-third. I cannot specify the time required to boil down, because it varies with the quality of the tomatoes. When cold, bottle and tie down the corks. MRS. E. SNEDEKER.

Japan Quince Fruit.

It is said that the fruit of the flowering Japan quince—Cydonia Japonica—readily produces a firm jelly of fine flavor, and that baked or stewed by itself it is very palatable and is also useful to flavor other cooked fruits. We have for many years gathered this fruit laying it away in our chest-of-drawers for the sake of its pleasant, aromatic odor, but this is the first we have learned of its being used for culinary purposes.

Making Cotton Fabrics Fireproof.

Dr. Kedzie states that cotton clothing could be prevented from burning with a blaze by the use of borax in starching. A teaspoonful to each pint of made starch is the quantity to be used. It was shown by experiments that the most inflammable of cotton goods, when treated with borax-starch could not be made to burn with a blaze. This is a simple experiment and one that any laundress can try for herself and prove whether the starching of all cotton clothing in this preparation would not be likely to save life and suffering by its use.

QUESTIONS ANSWERED.

Coloring Pickles and Sweets Green.

Is there any harmless substance that will color pickles, ice-cream, etc., green?

MRS. J. J.

ANS.—The following green coloring extract is said to be destitute of any poisoning properties: Dissolve five grains of saffron in one-fourth ounce of distilled water, and in another dish dissolve four grains indigo carmine in one-half ounce distilled water. After mixing thoroughly let stand 24 hours, then put together, and the result will be a green solution capable of coloring four or five pounds of sugar.

To Restore Old Tea-Trays.

Our trays have become sadly worn. What can we do with them? M. L.

ANS.—Wash them thoroughly with soap, water and a little pumice-stone. Wipe and dry before the fire. Procure good copal varnish, mix, with it some bronze powder and apply with a brush. Put the trays into an oven at a heat of 212 deg. to 300 deg. until the varnish is dry. Two coats will make them look very like new.

The Literary Revolution.

What Is It? It is a method of placing literature, of the best class only, within reach of every one. Books are reduced in price to but a fraction of their cost heretofore. July is supposed to be the Dull Month of the year. Booksellers close shop and go fishing, because book buyers are supposed to have done likewise. The Literary Revolution has made the past July one of the busiest months of the year for dealers handling our books, because the people believe in it. Letters have come to us like a flood; telegrams from dealers have come like the day before Christmas, calling for more books, and quickly. Our bindery is now taxed for the production of 4000 volumes a day, not counting pamphlets, and we are taking immediate steps to double its capacity, to keep up with orders. All Revolutions seek volunteers, and it has been the policy of The Literary Revolution from the start to give special reward to early volunteers in its support. It offers special terms to all whose orders, with cash, are received during August, as follows;

July Victories.

August Opportunities.

Chambers's Encyclopædia.

A verbatim reprint of the last English edition, in 15 beautiful volumes, clear nonpareil type, handsomely bound in cloth for $7.50; the same printed on finer, heavier paper, wide margins, and bound in half Russia, gilt top, price $15.00. The first eleven volumes are ready for delivery. Volume 14 will be ready Aug. 15. The remaining volumes will be completed by October.

AN AMAZING OFFER.

To all whose orders and money are received during the month of August, we will supply the 15 volumes, in cloth, for $6.50, and in half Russia, gilt top, for $13.00. The volumes issued will be sent at once by express, and the remaining volumes when completed.

A specimen volume in cloth will be sent, postpaid, for 50 cents, or in half Russia, gilt top, for $1.00, and may be returned at once, if not satisfactory.

The "CHAMBERS'S ENCYCLOPÆDIA" comprises the first 15 volumes of our "Library of Universal Knowledge," and the remaining volumes, complete in themselves, will be sold separately when published.

Curiosities. To illustrate and demonstrate the superior literary and typographical character of our books, notwithstanding prices are low beyond comparison with the cheapest books ever before published, we publish twelve books in pamphlet form and send postpaid as follows. As mere curiosities they are worth obtaining by every one, even if they were not intrinsically valuable. As might be expected, they are selling by the million. All the following are unabridged, and none of them are in type smaller than brevier. Nearly all of them have heretofore been published by other houses at from $1.00 to $1.25 each. Macaulay's "Life of Frederick the Great," Carlyle's "Life of Robert Burns," Thos. Hughes' "Manliness of Christ," John Stuart Mills' "Chapters on Socialism," Mary Queen of Scot's Life, by Lamartine; "Leaves from the Diary of an Old Lawyer"—short, thrilling, laughable, pathetic stories—each complete, price three cents. "The Light of Asia," by Edwin Arnold; "Baron Munchausen's Travels and Surprising Adventures;" "Vicar of Wakefield," by Oliver Goldsmith; "Stories and Ballads for Young Folk," illustrated, by Ellen Tracy Alden, each five cents. Closing the list is Bunyan's "Pilgrim's Progress," price six cents; and "Private Theatricals" (humorous stories, not plays), by author of "Sparrowgrass Papers," price, two cents.

Books, 3 Cents.

Books, 5 Cents.

6 Cents—2 Cents.

Notwithstanding the amazingly low prices of these pamphlets, they pay us a good profit. The Literary Revolution does not humbug people by pretense of philanthropy. People who have sense enough to appreciate good books are generally honest enough to be willing to pay for them, and they can afford to pay when prices are low as the Revolution makes them. In this connection it is proper to mention a few facts. Some millionaire publishers have been adding to our fame and multiplying our friends by calling us pirates. They pay (when they please) foreign authors a copyright. One of them charged you $1.00 for Hughes' "Manliness of Christ"—we sell it to you for 3 cents. How much of the 97 cents difference did Hughes get, do you think? Another published Geikie's "Life of Christ" for $8.00—our price is 50 cents. How much did Dr. Geikie get of the $7.50 difference? His letter to us says "nothing." Scribner's Monthly attacked us recently, calling us Cheap John Publishers. The same electrotypers and printers that do their work are working also for us, and you want no books more beautiful than are some of ours. The great Methodist Book Concern has refused us space even in the advertising columns of its several Christian Advocates. Why? Our books are so cheap they contrast with and injure the sale of theirs. We reduced Smith's "Bible Dictionary" from $3.00 to 50 cents; Kitto's "Cyclopædia of Biblical Literature" from $10.00 to $2.00; and Young's "Analytical Concordance to the Bible," "the Webster Unabridged" of religious literature, the greatest work of the kind which the century has produced, from $15.00 to $2.00. The people may pronounce the verdict who is guilty of wrong-doing—we, or the millionaire publishers

Stop Thief!

Who Is He?

General Grant. General Grant once said that the best way to get rid of a bad law is to enforce it. If the want of an international copyright is a wrong to foreign authors, American publishers are to blame that there is none, and could influence the passing of such a law quickly if they chose to do so. We believe that the author of a book is as much entitled to absolute property in it the world over as is the author of any other product of the hand or brain. We vote for a law to give him such ownership, and The Literary Revolution more than all other influences is forcing the consent of millionaire publishers to the passing of such a law. But there is plenty of humbug in the talk of high prices being the necessary result of copyright. Five cents copyright on a book would give an author $5,000 on a book that would sell 100,000 copies; and a book intended for the masses that will not sell 100,000 if put at a reasonable price does not deserve to be published at all. And the really standard books that the masses want ought to sell and will sell a million copies each easily when The Literary Revolution has achieved its final victories and made the masses readers of good books. And a million books, paying copyright of even one cent each would give an author $10,000, which is more than ten times what the average successful author now gets. But Bunyan, Goldsmith, Milton and Virgil are no longer wanting copyright, and Macaulay, Carlyle, Gibbon, De Foe, Plutarch and Æsop ceased to receive it long before the days of The Literary Revolution. We do pay five to fifteen cents copyright on several of our books to American authors who have the right to it, and we are paying regular salaries, many thousand dollars a year, to writers in our service.

Standard Books.

Library of Universal Knowledge, 21 vols., $10.50.
Milman's Gibbon's Rome, 3 vols., $2.50.
Macaulay's History of England, 3 vols., $1.50.
Macaulay's Life and Letters, 50 cents.
Macaulay's Essays and Poems, 3 vols., $1.50.
Chambers's Cyclopædia of Eng. Literature, 4 vols, $2.
Knight's History of England, 4 vols., $3.
Plutarch's Lives of Illustrious Men, 3 vols., $1.50.
Geikie's Life and Words of Christ, 50 cents.
Young's Bible Concordance, 311,000 references (preparing), $3.
Acme Library of Biography, 2 vols., each, 50 cents.
Book of Fables, Æsop, etc., illus., 50 cents.
Milton's Complete Poetical Works, 50 cents.
Shakespeare's Complete Works, 75 cents.
Works of Dante, translated by Cary, 40 cents.
Works of Virgil, translated by Dryden, 40 cents.
The Koran of Mohammed, by Sale, 35 cents.
Adventures of Don Quixote, illus., 50 cents.
Arabian Nights, illus., 50 cents.
Bunyan's Pilgrim's Progress, illus., 50 cents.
Robinson Crusoe, illus., 50 cents.
Munchausen and Gulliver's Travels, illus., 50 cents.
Stories and Ballads, by E. T. Alden, illus., 50 cents.
Karl in Queer Land, illus., 50 cents.
Acme Library of Modern Classics, 50 cents.
American Patriotism, 50 cents.
Taine's History of English Literature, 75 cents.
Cecil's Book of Natural History, $1.
Pictorial Handy Lexicon, 25 cents.
Sayings, by author of Sparrowgrass Papers, 50 cents.
Mrs. Hemans' Poetical Works, 50 cents.
Kitto's Cyclopædia of Bib. Literature, 2 vols., $2.
Rollin's Ancient History, $2.25.
Smith's Dictionary of the Bible (new edition ready soon), 50 cents.
Works of Flavius Josephus, $2.
Comic History of U. S., Hopkins, illus., 50 cents.
Health by Exercise, Dr. Geo. H. Taylor, 40 cents.
Health for Women, Dr. Geo. H. Taylor, 35 cents.
Library Magazine, 10 cents a No. $1 a year.
Library Magazine, bound volumes, 80 cents.
Leaves from the Diary of an Old Lawyer, $1.
Republican Manual, 1884, 50 cents.

Each of the above bound in cloth. If by mail, postage extra. Most of the books are also published in fine editions and fine bindings at higher prices. Descriptive Catalogues sent free on request.

Remit by bank draft, money order, registered letter or by Express. Fractions of one dollar may be sent in postage stamps. Address

AMERICAN BOOK EXCHANGE,

JOHN B. ALDEN, MANAGER. Tribune Building, New York.

AGENCIES: Boston, H. L. Hastings; Philadelphia, Leary & Co.; Cincinnati, Robert Clarke & Co.; Indianapolis, Bowen, Stewart & Co.; Cleveland, Ingham, Clarke & Co.; Toledo, Brown, Eager & Co.; Chicago, Alden & Chadwick; in smaller towns the leading bookseller, only one in a place.

News of the Week.

HOME NEWS.

ELECTIONS IN 1880.

All the States will elect Presidential Electors on Tuesday, Nov. 2. All the Territories will elect delegates to Congress on the same day. All Representatives in Congress to be elected by the several States will be chosen on Tuesday, November 2, except the following: Indiana will elect her State officers and Representatives in Congress, on Tuesday, Oct. 12. Maine will elect Governor, Representatives in Congress and the members of the Legislature, on Sept. 13. Ohio will elect minor State officers and Representatives in Congress, on Tuesday, Oct 12. Vermont will elect State officers Representatives in Congress and members of the Legislature, Sept. 7.

Most of the State officers and members of the Legislatures will also be elected on Nov. 2. United States Senators will be elected this coming Winter by the Legislatures of Alabama, California, Connecticut, Delaware, Florida, Georgia, Indiana, Maine, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Jersey, New York, Pennsylvania, Tennesee, Vermont, West Virginia and Wisconsin.

THE POLITICAL NEWS.

There is considerable activity in political circles on all sides. The National Democratic committee has established headquarters in New York city and has begun the campaign by sending out documents bearing on the Presidential question. The Finance Committee is composed of an unusual number of solid men, not only in influence, but in monetary matters as well. In Philadelphia the opposing forces have pooled their issues and the city and county committees have, for the present at least, sunk their differences and have rolled up their sleeves for Hancock. The Republican committees of Pittsburgh have formed a combination and will work together for Garfield. War to the knife has been declared in Philadelphia between McManes and Cameron, and there will be a desperate struggle. There have been a number of Congressional nominations made in the last few days, among them the following: C. E. Hooker, Dem., Fifth Mississippi District; Isaac L. Morrison, Rep., Twelfth Illinois; W. P. Canaday, Rep., Third North Carolina; Emanuel Schultz, Rep., Fourth Ohio; W. R. Meyers, Dem., Ninth Indiana; John C. Blair Hoge, Dem., Second West Virginia. There is a serious Republican split in the Cleveland district. Congressman Townsend has been renominated, but a large majority bolted in the interest of Ex-Mayor Rose. The Ohio Democracy held a convention the other day, ratified the national ticket and adopted the platform. The Missouri Democrats have nominated Crittenden for Governor and the following ticket: Attorney General, D. H. McIntyre; Register of Deeds, Robert A. McCullough; Railroad Commissioner, George C. Pratt; Presidential Electors-at-Large, Colonel J. D. L. Morrison and N. Phillips. General Weaver, the Greenback candiate for President, is very busy. He arrived at Washington on the 29th from Alabama, where he had made 14 speeches in 14 days. He says the Independent ticket will be elected by 4,000 majority if there is a fair count..... The Democratic nomination of State officers in West Virginia is as follows: For Governor, Jacob L. Jackson; Auditor, Joseph S. Miller; Treasurer, Thomas O'Brien; Judge of the Supreme Court, Thomas Green; Attorney-General, C. C. Watts; Superintendent of Schools, P. L. Butcher; Presidential Electors, E. W. Wilson and E. G. Cracraft. The Ohio State Greenback Convention met at Columbus the 28 ult. and was called to order by Robert Schielling. H. Kellogg, of Toledo, was made permanent Chairman, and J. H. J. Clarkson, Secretary. The national platform adopted at Chicago was accepted as the State platform, with two or three minor resolutions. The following is the ticket nominated: Secretary of State—Charles A. Lloyd, of Seneca; Supreme Court Judge—D. W. C. Louden, of Brown County; Clerk of Supreme Court—Charles Bowsall, of Columbiana; member of Board of Public Works—Amos Roberts, of Knox County; School Commissioner—R. B. Smart, of Ross County; Presidential Electors at Large—H. Kellogg, of Lucas, and L. T. Faster, of Mahoning.

POSTAL SERVICE DEFICIENCY.

The report prepared by Auditor McGraw of the receipts and expenditures of the Post Office Department for the quarter ending March 31, 1880, was issued the 28th ult. It shows an excess of expenditures over receipts for the quarter amounting to $336,553.36. The receipts for the quarter for the sales of postage stamps, newspaper wrappers, and postal cards amounted to $8,476,072.23; from other sources, $373,759.86; total receipts, $8,849,832.09. The total expenditures for the quarter amounted to $9,186,386.45. The following are some of the principal items of expenditure for the quarter: Inland Mail Transportation—Railroads, $2,067,510.-93; star routes, $1,711,581.59; steamboats, $194,845.-24. This quarterly report, and the two others previously prepared, for the quarters ending Sept. 30 and Dec 31, 1879, show the total deficiency for the first nine months of the fiscal year, ending June 1880, to be $2,199,642.97. Post Office Department officers estimate the deficiency for the present fiscal year at $2,600,000, and if it is kept within this amount it will be less than for any previous year since 1867. That year it amounted to $3,938,457, and last year, (ending June 30, 1879,) it amounted to $3,407,919.

A SPANISH BULL-FIGHT IN NEW YORK.

The metropolis of this Western World was startled some time ago by the blood-curdling announcement of some Spaniards that they proposed to make an exhibition of a genuine Spanish bull fight here in the city. At first the story was discredited, but the Spaniards proved to be in earnest (in their efforts to make money), and arrangements were made for the exhibition. The show came off last Saturday, to the satisfaction of all non-participants and to the regret of something over 3,000 spectators who had purchased tickets at $1.50 each. An arena was constructed at 116th street and 6th Avenue. It was a circular inclosure about 100 feet in diameter surrounded by a fence six feet high. Outside this was an alley about five feet wide, then another higher fence and outside this seats for the audience. It was announced that bulls would be imported from Spain, as none fierce enough could be found in this country, but this idea was given up and when all was ready the parties purchased a dozen peaceable Texan steers at the New York stock-yards. The fighters were six in number, and dressed in tight-fitting garments having all the colors of the rainbow and two or three others that the rainbow never dreamed of, each having also a loose cloak with which to irritate the animals. At the appointed time a steer was led into the inclosure. He made a dive for one of the fighters, and he in turn made for the fence and jumped into the alley where he was safe. This proved to be their method of fighting. They would worry the animal by shaking their cloaks before his eyes and then run and jump the fence, and sneak up behind and paste a rosette to his body and then run. They never had more than one steer on the arena at the time and several of them were too lazy and conservative to take any notice of the Spaniards. After a while the thing became monotonous and the people left. The prevailing opinion was that the Spaniards were excellent fence jumpers but decidedly poor fighters.

CONDITION OF DR. TANNER.

The starving man in Clarendon Hall this city is still alive, but he is in a greatly enfeebled condition. To-day he completes his fifth week, but there is a likelihood, which almost merges into certainty, that he cannot continue the ordeal through the five remaining days of his proposed fast. For some time past, he has, contrary to the advice of his medical watchers, insisted on drinking mineral water instead of spring water, and this is supposed to have increased his feebleness. He now vomits very frequently, and almost invariably after drinking, emitting the water he drinks, and mucus tinged with bile. He is becomingmore irritable and sensitive to noise. He now often omits his accustomed morning drives, preferring to lie quietly on his cot, and when he arouses himself, his walk is feeble and staggering. In short, his iron constitution is gradually but surely giving way under the tremendous strain to which it is being subjected. The physicians attending him have more than once been seriously alarmed at his symptoms, and precautions are taken for instant restoration, should he give way. The nausea and vomiting are expected to increase rather than be relieved until the end of the fast, and then there is danger the stomach will be so enfeebled that it can hold no food, and a second and forced fast be thus inaugurated. But still his will is firm. He does not yet propose to give up the feat.

MISCELLANEOUS.

A venerable old man of Kingston, Wis., named Uriah Utley, 76 years of age, was shot and killed by his son Frank, 28 years old on the 29th. It is probable the father was shot while sitting in a chair.....Severe hail storms, which did a great deal of damage visited Norfolk, Va., and Wakeham, Mass., on the 29th ult. A large water-spout was seen for half an hour in Onset Bay..... Inquiries are now being held by the authorities concerning the accident which happened to the steam-boat Narragansett that was run down in Long Island Sound by the Stonington, and also in the case of the Seawanhaka which took fire in the East River. About a hundred persons lost their lives on the two occasions. It is to be hoped that, if carelessness was the cause, the guilty ones will be brought to justice.....An experiment which, in point of interest, cannot be easily surpassed, took place recently in England. It was the trial of a combination of balloons by which it is proposed to explore the arctic regions. Since all attempts to reach the North Pole by land and water have proven futile, it is now proposed to sail through the one remaining element, the air. Three baloons were coupled together supporting four cars, which will be heated artificially and which contain the travelers. Three baloons are used in order to be safe in case an accident should happen to any one of them. The experiment was pronounced satisfactory, and Commander Cheyne, who originated the idea, will forthwith carry it into practice.

An accident occurred on the night of the 22d ult. on the Detroit River. Father Biyenburg, of the Church of the Holy Trinty, of Detroit, had taken his altar boys on an excursion to Monroe, Michigan, in the steam yacht Mamie. On the their return, while coming up the Detroit river, about 10 o'clock on Thursday night, at a point just below Grosse Island light-house, the yacht was met by the steamer Garland, of Detroit, having on board the Moulders' Union and a large party of friends, and a collision took place, the Garland literally running the steam yacht down and almost running over her. There were twenty-four persons on board the Mamie, and of these seventeen lost their lives. The yacht sank almost instantly. The collision was the result of carelessness. The moon was shining very brightly and to all appearances there was no excuse whatever for the accident.....The Mormons celebrated at Salt Lake, Utah, Saturday week, the anniversary of their first entrance into the valley 33 years ago. There was a big procession, with representations of agriculture, horticulture, the trades, manufactures, and various industries, including mining, which 11 years ago was proscribed among the Saints, and ceremonies in the tabernacle.....A Fargo (Dak.) woman has turned up who claims to be Mrs. Tanner, but she left the doctor to get three square meals a day. She says his theory that people eat too much became a troublesome mania, and when he undertook to bring her down to air and water she got a divorce.....The largest botanical depot in the world is said to be at Statesville, N. C., where the firm which controls it has now in stock 1700 varieties of roots, herbs, barks, seeds, flowers and mosses and all sorts of plants for herbariums, in quantities of from 60 to 35,000 pounds of each kind. They pay the collectors, who are mainly Cherokees, either in cash or goods, and last year disposed in this way of $40,000 worth of merchandise, shipping 1,800,000 pounds of roots and "yarbs".....Partial returns of the local indebtedness of the country from 19 States, nearly all in the North, give an aggregate of $764,206,299. Robert P. Porter, the special investigator of the subject, states that the local indebtedness of the remaining States will probably not exceed $100,000,000. The aggregate State debts, which were $352,866,000 in 1870, are now $266,638,-000, a reduction of one-third. At present Mr. Porter does not think that local indebtedness has been greatly increased since 1870 .....Gen. Grant has been elected president of the New Mexico San Pedro and Canon del Agua mining company holding 36,000 acres of copper and gold-bearing land 30 miles south of Sante Fe, and within 10 miles of the Atchison, Topeka and Sante Fe road. The capital is $10,000,000, and Gen. Grant has seen the property and accepts the position. His election to the presidency has carried its stock up from $2 to $8 a share in Boston and New York.....The Wisconsin University is a very unfortunate institution. A few years ago President Chadbourne of Williams was led into resigning by the incompatibility between him and the Regents, and it is said by local correspondents that President Bascom, his successor, has been nearly driven to the same point. He has addressed an open letter to Gov. Smith requesting him not to appoint politicians on the Board of Regents, and saying pretty plainly that those now on the Board hurt the interests of the college. The Milwaukee Sentinel says Wisconsin can better afford to lose every politician who lives off its tax-payers than one useful and honest man such as President Bascom. .....Milwaukee is to have a romantic wedding in September, when F. G. Tibbets, a millionaire bachelor of Philadelphia, 70 years old, takes to wife Widow Martin, who controls $2,000,000 worth of property in Milwaukee. J. B. Martin requested on his death-bed that his widow marry Tibbets, who was her first love when both were too poor to marry..... ..The Ute Commissioners have begun anew their councils with the Indians at Los Pinos Col., to arrange for their transplanting on new reservations, and hope to finish up before cold weather.

FOREIGN.

The dispute over Turkey's cession of territory to Montenegro and Greece is still the most exciting topic of European interest. The Sultan appears to be about to come to an amicable arrangement with the former, by ceding to it Duligno, instead of the strip of Albanian mountain formerly insisted upon, but which was bravely defended by the Albanians who refused to be handed over. The Porte does not seem to be so complaisant with Greece, however, and still refuses to carry out the *recommendations* of the Berlin Conference, even when backed up by threats of hostile measures. Turkey has about 35,000 troops on the Greek frontier and could easily whip Greece's 22,000; but it is very unlikely that Europe would look on without interfering in such an unequal struggle, and it is the knowledge of this that emboldens Greece. Should war break out in that quarter Servia and Bulgaria will at once take a hand, and so probably will Eastern Roumelia which is anxious to obtain complete freedom from the Porte. Meanwhile the Sultan does nothing in the way of effecting the promised reforms in Asia Minor and in European Turkey; and if the Powers could only agree as to his successor at Constantinople, the turbaned infidel would be straightway kicked across the Hellespont, or driven, fiercely fighting, into it. The quarrel between Russia and China seems in a fair way to a friendly adjustment. A Chinese ambassador, the Marquis Tseng, has been received at St. Petersburg, and it is said he has full powers to settle the matter. The Czar, too, has sent a plenipotentiary to Pekin. Both sides are still preparing for war, however, but with less urgency.

The Compensation for Disturbances bill passed the British House of Commons last Tuesday by a vote of 303 to 237—a considerably smaller majority than the Government expected. Its object is to afford compensation for all improvements to small Irish farmers who may be evicted from their homes through their inability to pay rent on account of the distress which has lately been so severe in the west of the kingdom. The bill has yet to pass the House of Lords, and as that body is strongly Conservative and that party is opposed to the measure, it is sure to be defeated there unless the lords are afraid to risk the popular commotion such a defeat would be sure to arouse. In case the bill is thrown out by the Upper House an agitation is already threatened, whose object would be to do away with the hereditary legislators, and instead of the House of Lords, elect a Senate as in this country.....The Hares and Rabbits bill also has been taken up in the House of Commons and passed its second reading—that is, been voted on a second time, all bills having to be voted on three times before they go to Her Majesty for signature. .....The "Herald" Irish Relief Committee has disbanded, after having distributed about $340,000. Other relief committees will soon disband also, as the "famine" is about over,.....The Irish land agitation is reviving. The crops are reported excellent all over the island, grain and roots being especially good—over an average.

Last week we venturned the opinion that the hostile advance of Ayoob Khan toward Candahar in Afghanistan would delay the evacuation of the country by the British. On Tuesday a cablegram confirmed this opinion by telling us that a brigade of British troops under General Burrow had been annihilated by Ayoob Khan's forces near Candahar, and that the remainder of the British troops in that section had retreated into the citadel of that city. Later tolegrams confirm the defeat, but lessen its severity. Nearly half Burrow's forces seem to be missing, but the rest, chiefly in straggling parties, have been making their way into the city during the past week. The British force was made up mainly of sepoys, or native Indian troops, with English officers, together with about 700 or 8 0 Europeans. While marching to the support of a friendly Afghan chief who was about to oppose Ayoob Khan, most of the Afghan soldiers rebelled and joined the Khan, who, thus aided, fell suddenly upon his foes and after a sharp struggle utterly routed them. This was in Northern Afghanistan. At Cabool in the south the lately proclaimed Ameer, Abdurrahman, has had a friendly interview with the British representative, and no outbreak has as *yet* occurred. For the sake of keeping up their *prestige* among their Hindoo subjects especially and in the eyes of the world at large, the English must once more face the hostile Afghans and fight until these are utterly vanquished. This will take time for the Afghans are as brave as they are treachorous. Reinforcements are being hurried forward from India and from England.

In France the elections to the Councils General hitherto show that in 62 cases the Republicans have been successful and the Conservatives in sixteen. It was feared that the amnesty to the Communists and the contemporaneous expulsion of the Jesuits accompanied with threats of a like fate for the other religious orders would arouse public alarm, to the loss of the Republicans, but this has not as yet occurred. A general election will be held next Summer, and it is expected that Gambetta will then be declared President instead of Grevy. At present, France seems determined to remain at peace while vigorously preparing for war.

The ex-Empress Eugenie has returned to England after her pilgrimage to the scene of her son's death. The Zulus who killed him say he fought "like a lion," when brought to bay, and died only after receiving a score of wounds from the encirling savages some of whom he wounded with weapons wrested from their own hands..... Ole Bull, the violinist is once more sick unto death.....The Canton of Schwyz, Switzerland has restored capital punishment, making the fourth canton that has restored the death penalty.....Mr. Gladstone was prostrated last Friday with a congestive chill of the left lung. No immediate danger.

In Mexico Gen. Gonzales has lately been elected President of the Republic to succeed the present incumbent, Gen. Diaz. The latter absolutely refused to be a candidate for re-election, though there is little doubt but that he would have been successful, had he been in the field. He has proved by far the ablest statesman and soldier Mexico has produced of late, and the new administration will be greatly strengthened by his having a seat in the Cabinet as Minister of War. There was only one attempt made to assassinate Gonzales after his election, and only two or three chiefs issued rebellious pronunciamentos and levied contributions on merchants and others—an extraordinarily quiet election for Mexico.

AGRICULTURAL NEWS.

FROM March 1 to July 28 the number of hogs packed, according to the best attainable information, has been 3,296,791 against 2,241,661 in '79. From Nov. 1 to July 29, by the same calculation, the number of hogs packed was 10,247,000, against 9,721,000 last year.....Our meat exports since last Nov. 1 are put down at 680,000,000 pounds, against 610,425,000 pounds in the same period in '79.....A Mr. Jackson, who has over 35,000 tea plants on his farm, near Savannah, Ga., recently sent to the Commissioner of Agriculture a tin box containing several samples of the tea raised on his farm. The Commissioner subsequently brought the samples to this city and went incognito to one of the largest tea establishments here, representing that he had some to sell. An expert was called in to examine the tea and he pronounced it India tea, worth 50 cents per pound. Commissioner Le Duc then had difficulty in convincing the expert that the tea was grown in this country, and could be produced for one-third the price named.....The Mark Lane Express, of July 26, says that the harvest in England would probably commence within a week, and would be general in three weeks. The wheat plant still stood well, despite the recent storms, but there was some increase in blight. A good deal of barley was laid by the storms, but where it escaped this, it was the most promising of crops. Oats in Ireland and Scotland were exceedingly good. Markets during the past week had been almost stationary, the trade being completely dominated by the harvest prospects of this and other countries. These were far from being uniformly promising, but taken altogether, they were sufficiently favorable to prevent an improvement, which ordinary circumstances of supply and demand should otherwise have induced. The quantity of wheat on passage was nearly 2,000,090 quarters. The deliveries of English wheat and barley were rather under the average for that time of the year, and prices were unusually low. English oats commanded good prices, which caused deliveries considerably above July averages. Imports into the United Kingdom for the week ending July 17, 816,698 hundredweights of wheat, and 118,947 hundred-weights of flour.

Cablegrams from England July 31 say that very heavy wind and rain storms on the preceding day had done an immense amount of damage to the wheat crop, especially in the Southern parts of the country. Much of it is reported to have been entirely ruined, as well as a great deal of hay, and a great extent of pasture land along the rivers has been flooded.....A hail-storm passed over the vicinity of Stevens' Point, Wis., on Monday evening, covering the ground to the depth of several inches with hail-stones of great size, killing fowls, thousands of prairie chickens, and sheep. Shingles were torn from several roofs, and more than a hundred farms were entirely cleared of hay and grain. The hop-yards were stripped,

and the forests left as bare as in Winter. Three hail-stones weighed one pound. The storm covered a strip four miles wide and ten miles long. Every green thing was swept before it, and not a bushel of grain can be saved. The damage is estimated at $75,000.....Reports from more than 100 in places Michigan, telegraphed here on July 31, show that the continuous rains the past few weeks have inflicted less injury than was feared. Wheat was harvested in good order, despite the somewhat unfavorable circumstances, and the quality of the crop in one-half the places reported is fair to very good, and in one half the remainder injured slightly, but it is thought not seriously. The total crop is believed to be much larger than in 1879, which was the largest crop ever harvested. The product is estimated at 35,000,000 bushels. The reports as to hay and oats are excellent, and the same is true of all the Spring crops..... A telegram from St. Paul, Minn., on July 31, says that nearly complete returns have been made to the office of the Commissioner of Statistics, of the acreage of the wheat in the State this year, and its yield and average of last year. Last year's acreage was 2,769,289 acres, and the yield 33,451,435 bushels, some counties being estimated. This year the acreage is 2,959,683 acres, some counties being estimated. This is an increase of 190,000 acres. The returns show a heavy falling off in the old-settled counties, where the wheat crops have been failures for several years, while some of the frontier counties have more than doubled in the acreage. This shifting of production tends to raise the average. Estimates from nearly all the counties, and opinions from competent farmers justify the belief that the average yield per acre this year will be from 10 to 12 bushels in the southern part of the State, and from 16 to 20 in the western counties and the Red River Valley. It is thought the average yield will not fall below 15 bushels, which will make an aggregate yield of over 44,000,000 bushels. This, of course, is subject to accidents of harvest and errors of too sanguine reporters..... "The first bale of this season's crop of hops was sold on Thursday by S. & F. Uhlman, in the Produce Exchange, to M. Eckstein, of Staten Island. The hops were grown by W. Hathaway, of Oriskany Falls, Oneida County, N. Y., and sold for 50 cents per pound. The Messrs Uhlman say that, judging from present reports, the coming hop crop in this State and throughout the country will exceed that of last year 25 per cent., the crop then being about 120,000 bales. It is too early to speak with certainty of the crop abroad, but present indications are of a fair yield. A new parasite has attacked the vines in some districts, and this may affect the general yield. The first bale of last year's crop was not received in this City until Aug. 10.

He Still Lives.

Some years ago Dr. R. V. Pierce, of the World's Dispensary and Invalids' Hotel, of Buffalo, N. Y., and London, was sent for to examine a terrible disease of the knee-joint, resulting in ulceration and extensive sloughing of the bone and tissues. The man's life had been despaired of by the previous attendants. Amputation at the thigh was promptly decided upon and skillfully performed by Dr. Pierce, and as after treatment to purify the blood and prevent a recurrence of the malady the doctor's Golden Medical Discovery was freely prescribed. The man's system was thoroughly purified and strengthened, he rapidly gained his health, the stump healing nicely, and he is to-day a happy man. The case was among the first in which this wonderful blood purifier was tested. It has since manifested its wonderful power over the worst scrofulous and other blood diseases. Taken for a time it so purifies and strengthens the system as to strongly fortify it against the encroachments of disease. Sold by druggists.

HON. R. V. PIERCE:—DEAR SIR—I would say that I have sold your medicines for seven years. The Golden Medical Discovery is the best cough remedy I have ever used and in every case where I have recommended it, it has cured. I have used it in my family for my children. It cures their colds and coughs in a day or two. My wife has used it several times when down sick. It invariably gives immediate relief. Its sale increases daily.

J. B. KESTER, Druggist.

Middleville, Mich., Feb. 15, '79.

LYDIA E. PINKHAM'S VEGETABLE COMPOUND has done thousands of women more good than the medicines of many doctors. It is a positive cure for all female complaints. Send to Mrs. Lydia E. Pinkham. Sold by all druggists.

Refined and educated women will sometimes suffer in silence for years from kidney disease, or constipation or piles, which could be easily cured by a package of Kidney-Wort.

If you are almost worn out don't give up, but take Kidney-Wort and it will give you new life.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, July 31, 1880.

BEANS AND PEAS.—The bean market is quiet and the moderate receipts more than fill current export or local wants. A strong export demand is not looked for as sales are largely ahead of last year's to date. True, many have gone to new outlets this year, but sellers do not expect large Cuban orders in the place of what has gone to West Indian points. Red kidneys are a shade firmer. Green fairly quotable at $1.60@1.65 for Wisconsin. Southern B. E steady for perfect at $2 ₩ 2 bush. bag.

Marrow beans, prime, $1.57½@1.60, other, $1.45@1.55; medium, prime, $1.40; other, $1.2½@1.35; pea, $1.45@1.60; white kidney, $1.70@1.85; red kidney, prime, $1.40@1.45; other, $1.2½@1.35; black (or turtle soup), $2.20@2.25; Cal. Lima, $2.

BEESWAX.—Trade is in small lots, and 24½@25c. quoted for Western and Southern.

Exports since Jan. 1st, 53,478 lbs.: same time last year 32,300 lbs.

BUTTER.—The strong position into which fine and upper grades of State have moved has now a favorable influence upon good under grades. Creamery State has to take its chances with low grade Western. The volume of business is seasonably good for home and foreign use; buyers for the latter purpose are competing to some extent for best high priced stock. This is a good feature for a product that must henceforward take an outlet abroad for its arrived surplus. It is predicted that the English trade in American butter must steadily enlarge as the fine quality of our stock is yearly growing in attractiveness, while the cost of placing it in the British markets is likely to be decidedly in consumers' favor compared with much home raised and the important Danish deliveries. Exports of butter from Jan 1 to date, 16,000,000 lbs. or about 3,000,000 less than last year.

Creamery, finest 26@27c.; good to prime, 24@25c.; fair to good, 23@24c.; sweet cream, 23@26c.; State, firkins, yellow 20@23c.; pails and hf. tubs, choice, 23@24c., good to prime, 21@23c.; poor to good, 16@21c.; Welsh tubs choice, 22@23c; poor to good, 15@21c.; Western imitation creamery, 16@22c.; dairy, fresh, 21@22c.; good to prime, 18@20c.; poor to good, 14@16c.; factory, fine prime 18@19c.; other parcels 14@17c.

Receipts for week, 39,194 pkgs. Exports, 13,000 do.

CHEESE.—The exports for the week reach 24,800 boxes. The demand has been quite active, The larger receipts at one time caused weakness, but by the close marked firmness is noted.

Quotations: State factory, fancy, 10½@10½c.; do. good to prime, 9½@9¾c.; do. fair to good, 8½@9½c.; do. half skimmed, @7½c.; Wisconsin factory, fine, 9½@9¾c.; do. good to prime, 8½@9½c.; do. fair to good, 8½@8½c.; Ohio factory, fine, @9½c.; do. good to prime, 8½@9c.; do. flat, fair to good, 7½@8½c.; do, poor to fair, 6½@7½c.

Receipts for week, 102,009 boxes.
Exports, 87,000 do.
Liverpool cable, 52s.
Steam, 37s, 6d.@45s.

COTTON.—The market has been active, closing at for July, 11.41@11.45c.; August, 11.49c.; September, 10.30@10.91c.; October, 10.60c.; November, 10.43@10.49; December, 10.48@10.50c.; January, 10.56@10.58.; February, 10.68@10.70.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—New pitted cherries and blackberries have been wanted and the former have realized an advance. Apples and peaches are slow.

North Carolina apples, fair to good, at 6½@7½c.; choice, at 8@8½c.; New York State quarters at 7½@7¾c.; patent evaporated, in cases, choice at 14@14½c.; good and prime 13½@14c.; evaporated, sliced at ——c. Evaporated peeled peaches, good to choice, at 26@28c.; North Carolina peeled choice, at 16@17c.; Georgia prime at 15@16c.; fair to good at 13@14c.; common at 10@12c.; unpeeled halves at ——c.; do. quarters at 6@6½c. Pitted cherries at 17c. asked for old, and sales at 15@16c. for new. Blackberries nominal. Raspberries at 26@27c. for new. Prime at 17@17½c.

EGGS.—Receipts for week, 9,380 bbls.; do last week, 8,500 do. The demand is steady but light, and when there have been extra arrivals of a few hundred bbls. above the wants of the trade, prices have fluctuated against the seller. Fruit and vegetables have a weakening effect upon the egg market at this season. The late revision of prices is not named with confidence. Prime Western now lead the trade in quality merit.

Near Points, 17@18c. ₩ doz.; State and Penn. 16@17c.; Western, fresh, 16@17c.. Canadian, do. 16c.; poor marks and held lots, 15@15½c.

FLOUR.—Demand has been quite brisk and prices have been very strong since receipts are moderate.

Latest prices are $3.60@4.50 for inferior to very fancy superfine State and Western; 4.25@4.50 for ordinary to very good extra State, odd lots and lines; $4.50@4.65 for very good to fancy do.; $4.20@4.50 for ordinary to very good shipping extra Western, and $4.50@4.75 for good to fancy shipping extra do.; interior to very good white wheat extras, $5.25@5.75; very good to very choice do. at $5.75@6.75; red and amber winter wheat, inferior to choice grade and family, at $5.00@6.25; round hoop Ohio, $4.50@5.00; and trade and family brands of do. at $5.10@5.50; St. Louis at $5.15@5.85 for inferior to good extra, $5.85@6.75 for good to very choice; Minnesota clear, very inferior to fancy, at $4.20@6.00; Minnesota "straight," very poor to fancy, at $5.85@7.50, and patent inferior to very fancy at $6.00@8.75; unsound stock at from $2.25@5.00; city mill extra at $5.00@5.75 for very good to choice for the West Indies; do. for England, $4.25@4.60 for poor to very choice spring wheat, and $5.00@5.50 for winter wheat product; do. trade and family extras, $6.00@7.25; do. for South America, $5.75@6.00; No. 2 at $2.40@3.50 for poor to very choice.

Receipts for week, flour, bbls. 35,550; corn meal, do. 5,835; wheat, bush. 25,300,300, corn, do. 1,814,900, oats, do. 177,35; rye, do. 1,110, peas, do. 105,000; beans, do. 900; rice, pkgs. 1,000.

Exports for week, flour 105,935 bbls.; corn meal, 4,051 bbls.; wheat, 1,476,300 bush.; corn, 1,500,900 bush.; oats, 5,100 bush.; peas, 500 bush.; beans, 579 bush.; rice 1,750 pkgs.

FRESH FRUITS.—Supplies of nearly every item have arrived faster than they could be used and left over stock has been largely at buyers' option. Apples are the greatest drug. Southern Bartletts not running fine; stock now plenty; enough to be quoted by the bbl. but sales are slow. Grapes anticipate a demand. A small arrival of 400 boxes California Bartlett pears, Washington and Purple Duyenne plums quoted at $3@4.50 ₩ box. Blackberries have run out their season.

Apples, strawberry, ₩ bbl. $1.; Summer Pippin, 75c.@$1; Orange 75c.@$1; Nyack 75c.@$1; Red Astrachan, choice, $1; Sweet Bough, 75c.@$1; Sour 75c.@$1; Bough, common, 50@60c. Peaches, Jersey, ₩ basket, 40@$1; Md. & Del., Crawford, ₩ cr. $1.50@2; Troth, ₩ cr., 75c.@$1; per bask., 50c.@$1; Early York ₩ cr., $1.25@1.75. Pears, Bartlett, State, ₩ bbl., $5@7; Clapp's Favorite, State, $5@6; Bloodgood, $3@4; Catherine, $3@4. Scooter, $1@3.50; Bull, State, $2@3; Sugar Top, $2@3; Bell, State, $4@4.50; Bartlett, Southern choice $2@2.50; poor $1.25@1.75; Clapp's Favorite, $2.50; cooking pears, ₩ bbl. $2@2.50. Plums Egg, State, ₩ bbl. $4@5; Damson, Southern ₩ qt. 8@10c. Grapes, Delaware, Va., case of 18 lb boxes, 5@7; Concord, South'n, $2.5@4; Hartford, Southern, $3@4; Ives, South'n, $3@4. Ives and Hartford, Sth'n ₩ lb, 6@7c.; Concord 6@8c.; Delaware 10@12c. Blackberries, Lawton, Jersey, ₩ quart, 8@10c., Jersey, ₩ quart 5c. Whortleberries, Mountain, ½ bu. box, 75@85c. Jersey, ₩ ½ bu. box, 50@65c.; Md. & Del. ₩ qt.; 4@6c. Apricots, up-river, prime, ₩ qt., 20@25c., common, ₩ qt., 10@15c. Nutmeg Melons, Jenny Lind, Jersey, ₩ bbl., $1.75@2.25; citron, Jersey, $1.50@2. Watermelons, Baltimore, ₩ 100, $15@20; Nanticoke, $10@18, Norfolk, $5@10. Peanuts, unchanged and dull.

GRAIN.—Wheat has been active but variable as to price, closing firm. Exports for the week have been 1,600,000 bush.

Latest prices are for No. 1 white at $1.09@1.10; do., July, at $1.09½; do., August, at $1.08; do., September, at $1.08; No. 2 whites at $1.04@1.04½; ungraded white at $1.07@1.09; No. 2 red at $1.08½@1.09; do. July, at $1.08½@1.09; do. August, at $1.08½@1.09; do., September, at $1.08½@1.09½; do. October, at $1.09½@1.09½; do. steamer grade at $1.05; No. 3 red at $1.04½@1.05; do., steamer grade, at $1.01@1.02, ungraded red at 92c.@$1.06, mixed winter at $1.04½@1.05; No. 2 Milwaukee and hard spring at $1.09@1.10. Rye is firm at 85c. for No. 2 Western for August delivery. Corn has been active, closing at for New York No. 2, at 47½@47¾c.; do. July, at 47½@47¾c.; do., August, at 47¾c.; do., September, 48½@48¾c.; ungraded mixed Western at 41@47¾c.; New York No. 2 white at 53½c.; New York yellow at 53c. Oats are in liberal demand and higher; latest sales are of No. 2 white at 39@40c; No. 3 white at 35@36½c; New York No. 1 at 38c.; New York No. 2 at 38@38½c.; No. 3 at 35c.; ungraded white Western at 38@39c.; ungraded mixed Western at 36@38c.; No. 2 Chicago at 38½c.

HAY AND STRAW.—Demand is active and prices well sustained.

New hay quoted at 80c@$1.05, as to quality; shipping hay quoted at 85c.; retail lots at 90c.@$1 for medium, and $1.10@$1.15 for prime and fancy qualities; clover, 60@65c. Straw at $1@1.05 for long rye, 60@65c. for short rye, and 55@60c. for oats.

Exports for week, 3,900 bales; since Jan 1, 75,780 do.; do. last year, 42,300 do. Cheap supplies at present are from Canada.

HOPS.—The market shows a dull unsettled and weak feeling. Quotations are for

	Cents per lb.
New York, new crop, and choice	31 @34
New York, new crop, medium and good	27 @30
New York, new crop, low to fair	25 @27
Eastern, new crop	— @—
Wisconsin, new crop	— @—
Yearling	7 @15
Olds, all growths	4 @10
Pacific Coast, new	28 @32
Pacific Coast, olds (nominal)	5 @ 8

OIL CAKE.—Western is quoted $31@31.50.

POULTRY AND GAME.—Dressed chickens continue to arrive freely and best near points are lower. The weather has been more favorable for shipments and with the offerings turning out better the market has ruled quite steady for fowls and chickens. Turkeys have only a special hotel and steamer call.

Turkeys, choice, small, ice-packed, 13@14c.; fair to good, 11@12c.; Phila., dry-picked, 12@14c.; chickens, Phila., large, 2@2½c.; small, 18@19c.; State, scalded, 16@17c.; Western, scalded, 14@16c.; Fowls, Phila., dry-picked, 14@15c.; Jersey, dry-picked, prime, 13@15c.; scalded, 12½@13c.; State, dry-picked, prime, 13c.; scalded, prime, 12c.; Western, dry-picked, prime, 12@12½c.; scalded, prime, 12c.; poor to fair, 10@11c.; ducks, spring, dry-picked, large, 15@16c.; small, 13@15c; Spring, State, scalded, 12@14c.; Phila., old dry-picked, 10@11c.; squabs, white, per doz. $1.75@2; dark, $1@1.25.

As before, the free receipts of dressed tone down rates for chickens in coops. Fowls are quiet and much increase of supply would break prices.

Chickens, large, ₩ lb., 16c.; small, 15c.; Western & Southern 13@14c.; fowls, Jersey, 12c.; Western, 11@12c.; Southern, 11c.; roosters, 4@6c.; turkeys, mixed, Jersey, 11@12c.; Western, 10@12c.; ducks, N. J., N. Y. and Pa., ₩ pair, 55@75c.; Western 45@55c.; Southern, 40@45c.; geese, Jersey, $1.50@1.75c.; N. Y. & Pa. $1.25@1.50; Western, mixed, $1@1.25; Southern, 87c.@$1.12; pigeons, 20@35c.

Woodcock expected to open at 75@80c. ₩ pair. A few stall-fed pigeons quoted at $1.50@2.

PROVISIONS—Hog products have been active and advancing.

Mess pork quoted at $14.25 for July; $14.25@14.30 for August, $14.25@14.30 for September, and $14.30@14.35 for October, and $12 bid and $12.05 asked for sellers' option. Bacon at 7¾@7¾c. for long clear and 8¼c. for short clear. Lard at 7.65@7.67½ for Western steam on the spot. Beef—Extra India mess quoted at $16.50 for city; $10 for extra mess, and $9.50 for plain mess, $10.50@11 for packet, and $11.50@12 for family mess. Beef hams at $22.50@23. Tallow at 6¾@6 7-16c. for prime.

Receipts for week, beef, 830 pkgs.; pork, 1,950 bbls.; cut meats, 23,403 pkgs.; lard, 16,000 pkgs.

Exports, beef, 2,556 pkgs.; pork, 5,518 bbls.; cut-meats 12,977,229 lbs.; lard, 8,361,475 lbs.

TOBACCO.—The business is entirely in small lots on home trade account, with prices without change.

WOOL.—The market remains in a dull condition on account of the moderate movement in goods. Prices are held very steady.

LIVE STOCK MARKETS.

NEW YORK, Saturday, July 31, 1880.

BEEVES.—Receipts for week 13,856 head; do last week, 15,007 do. With just a fair supply of stock offering and a moderate home demand, the market at 10th st. was a trifle better than on Wednesday. Still it was hard to establish an actual advance and sellers quote a firm feeling with prices slightly in their favor. The large call for prime shipping cattle helped the market at Jersey City. Good and choice steers were readily sold at a small advance from rates on Wednesday; common native grass cattle were too plenty and declined nearly ½c. ₩ lb. But of Texas and Cherokee there were over 600 head on sale, and buyers could only be induced to take them by making very liberal concessions—in most instances a strong ½c., and in some cases ½c. Good Cherokees brought 8½c. to dress 55 lbs., but more than three-fourths of the Texans and Colorados were sold from 7c. to 8½c. to dress 55 lbs. and the sales include some fat cattle. The cool weather made a ready sale for good stillers, and 9½c. less 5c. per head was obtained for 5 car loads. A few really common Ohio grass steers were sold as low as 8c., to dress 55 lbs., but 8¼@8½c. to dress 55@57 lbs. was the general range for native steers. About 400 head were sold at 10@10½c.

MILCH COWS.—The range of prices keeps low but is quite equal to the common average of stock lately sent in. There is no snap to the market; most sales are at $30 to $50 per head, and the latter rated cows must have good dairying points. A few specials bring $55@60.

VEAL CALVES.—Trade fair and running upon best fed stock.

Live calves, N. J. and Bucks Co., choice, 6½c.; prime, 5½@6c.; State choice, 6@6½c.; prime, 5½@6c.; fair to good, 5@5½c.; poor, 3@4c.; heavy, good to prime, 5@6c., buttermilk, 2½@3c.; grass, 3@3½c.

SHEEP AND LAMBS.—Receipts for week, 34,552 head; do. last week, 28,204 do. Sheep were extremely dull and generally quoted 8c. off. Lambs opened about steady, but grew weak very rapidly and closed nearly ½c lower than the current rates of yesterday. The supply of both sheep and lambs was entirely too large for a Friday's market, and a good many car loads will be carried over. Sheep sold from 3½c. to 5½c. for poor to choice; Southern and Western lambs at 5½@6½c.; State, Pennsylvania and Jersey do. at $6.50@7.40 per 100 lbs., the latter price for a single deck load of choice lambs, 72 lbs. average, from Chester County, Penn.

SWINE.—Receipts for the week, 17,830 head; do last week 22,725 do. The small receipts are direct to packers. Nominal rates, $4.90@5.12 ₩ 100 lbs., the latter price for light State. City dressed quoted at 6½@7c., heavy to pigs.

WILL NOT SHRINK, SWELL, WARP, or RATTLE in the Wind
ALSO, THE BUCKEYE FORCE PUMP
Never Freezes in Winter Time.
Send for our Circulars and Price List.

IMPROVED CALIFORNIA WIND MILL.

Simple, Strong, Durable, Rosette Wheel and perfectly Self-regulating, avoiding 100 wearing joints. Also, Steven's Pony Feed Grinder and a perfect Rotary Motion attachment, without gearing, the power being communicated by the lift or up stroke of Pump Rod. Can be used for cutting feed, churning, &c. The best, cheapest and most useful power in the market. Full particulars, circulars, &c., sent free. Address the Manufacturers, CLARK & CO., SOMANAUK, ILL.

Reading for the Young.

REMINISCENCES OF A LITTLE GIRL.

MRS. M. J. GALPIN.

CHAP. XI.

A FIRE AT SEA.

ONE lovely day when the ship was making good time, and all on board seemed to partake of the freshness and beauty of sea and sky, suddenly there arose a long column of flame from the roof of the cook-house, and simultaneously burst forth that terrible cry of Fire! Fire! from every throat. Dismay and terror were depicted on every countenance to think of perishing far from home on the mighty deep, as death, either by fire or drowning, seemed inevitable to all. But the "Manilla man," of whom I have already spoken, rose equal to the emergency. Seizing the burning material he heaved it overboard, while giving his orders to the excited crowd, who seemed thereby panic stricken. The fire originated from some clothes which the women had hung on a line to dry, right across the flue of the cook-house, where they took fire and were the cause of the mischief. By the united efforts of passengers and crew the fire was at last subdued, but the cook-house and part of the rigging were completely demolished. After a few days, when the carpenter had all things "shipshape" once more, there came a fearful storm, which raged with unabated fury for 24 hours. The passengers had about concluded that the "shores of America they ne'er would see," but a guiding hand willed it otherwise, for about daybreak on the second morning the wind lulled, and in a few hours naught could be seen save sunshine, and the foamy breakers chasing each other in wanton play. But the ship, how she looked! Battered and torn, with masts and sails down, and another leak had sprung in the hull which required incessant pumping all day, until the carpenter succeeded in closing the fissure.

About a week after the storm two large sharks could be seen following the ship, to the utter consternation of the sailors, who say that they never leave till some one on board dies and is thrown overboard. In this case they were right, for there were two children on board sick at the time, and after a few days' illness they both died. The heart-broken mothers pleaded to have their remains kept till land was reached, but that was an impossibility, as they were in mid-ocean with no ice on board. The burial service was read at sundown on the day they died, and then the little bodies closely sewed up in stout sacks, were placed on an inclined board and gently slided off into the fathomless ocean. A wail of dismay arose from the hearts of the parents who thus saw their precious loved ones disappear forever. The knowledge that the sharks were following in the wake of the ship had been kept from the bereaved ones; but strange to relate, the morning after the burial the sharks had disappeared, and were never seen again during the voyage.

All through these varying scenes the little Therese was filled with wonder and awe; but she at length became so familiar with the roar of the ocean that its surges never disturbed her rest. When about three or four weeks out on their voyage, they came in sight of some of the islands of the archipelago, and while passing the island of Montserrat, Uncle Tom made a crayon drawing of it, which is still in his family as an heirloom. He also sketched the Bridgewater, the only vessel that had passed them during the whole trip. Drawing was a natural talent with Uncle Tom, and if in early life he had devoted his time and energy that way, he might to-day, if living, have rivaled our best artists. Sometime after passing those islands the ship was "becalmed," that is she floated idly on the water with not a breath to stir her canvas. The sea looked like glass and not a cloud could be discerned in the azure dome above them for days at a time. The heat became oppressive, and to give the lower deck passengers pure air, the captain had a large flue made out of canvas; this was let down through the hatchway, so that a current of air would be put in circulation from below.

It was while gazing down this hatchway and wondering at the big "cotton chimney" that our heroine met with her first mishap of the voyage. If it had not been for an overruling Providence that guards our every action it might have been fatal. While looking down very intently through the opening, she lost her balance and fell on the door of the lower hatchway that led to the bottom of the ship, where they kept the ballast. Half of this lower trap-door was open, and if she had fallen six inches nearer to the edge she would have gone down among the ropes and stones, and been dashed to pieces. Great was the consternation over this mishap to the ship's favorite. O'Hara, the first mate, carried her up to the cabin in his arms, and Uncle Tom was almost powerless from the shock, as he thought his darling was surely killed by the fall. But little ones will sometimes bear severe knocks, and in a few hours Therese was all right, save for some ugly looking bruises. After many days of idle, weary, drifting and waiting, a breeze at last sprung up, and with renewed hope and vigor they once more sped away to that "land of promise" which seemed so far away to their longing eye. One day when the ship was making good headway, the little Therese, who was sitting on the gunwale of the boat, lost her white sunbonnet, and as it danced away over the crest of the billows, she involuntarily arose to go after it. The captain was near by, and seeing her intention, he seized her or she would have fallen overboard.

There was a fascination for her in looking down into the deep, blue-green water and watching the fishes as they dashed to and fro in their play. And once while thus gazing down, a large "grampus" rose close to the ship's side with a tremendous snort that startled her so much that she was ever after somewhat afraid to sit there alone.

The day passed slowly by with little variation. But at length flocks of sea-gulls became visible, which the sailors averred was a sure indication that land would soon appear. Their surmises proved correct; for in a few days, tufts of grass and pieces of floating wood swept by to the intense delight of the passengers, who were in hopes that this long journey would soon be ended. The ship was most thoroughly washed inside and out, painted and put in good repair. A steam-tug was sent out from New Orleans to tow them up the Balize, and just seven weeks after they left their native land they reached the hospitable shores of free America. They had escaped shipwreck by storms three times, and were freed from destruction by fire. Taking all things into consideration, they had ample cause for thankfulness and rejoicing in thus safely reaching their destined haven.

There is but little shipping in these days at New Orleans, La., but then it was a port almost as much used as New York. All along the wharfs of the "Crescent City" the sails could be seen fluttering in the breeze, while now such an appearance would be the cause of much wonder.

I have at last crossed "the deep, blue sea" with my heroine, and in my next I will tell you her story, as the years rolled by and she developed into a noble woman.

Marshall Co., Kan.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—Perhaps I do not clearly understand your regulations for admitting members to the Horticultural Club. When first organized my impression was that only the *very* "young people" were invited to enter. Recently, however, I have thought even the "hoary head" might be found in the band of nephews and nieces. Is this correct? If so, then, since I enjoy as to age the "happy medium" between these extremes, perhaps you will favor my application for membership. Am I "eligible" in other respects, you may wish to know? If a deep-rooted love for flowers, which daily grows upon me, a persevering hand-to-hand conflict with the many odds one encounters in their cultivation can make me "eligible," then I am sure to be numbered with you. My yard would, no doubt, be considered by many of the cousins too small for much enterprise, but therein are many lovely plants. My little cottage home is embowered in vines (of my own planting, the past five years,) and surrounded by verdure and bloom. Most of the year the parterres and hedges are brightened by the flowers of a great many plants. I think that by taking an interest in the matter each of us might help Uncle Mark materially in his admirable plan of beautifying the world. Yours truly, MRS. VIRGINIA S. HALLER.

Smyth Co., Va.

[You are in every way eligible to membership.—U. M.]

DEAR UNCLE MARK:—The seeds so kindly sent us, by you came all right, for which accept our sincere thanks, our little boy was very much delighted to receive them. He laid off his plot of ground into a small garden and planted many kinds of vegetables in it. For a boundary line he planted a row of pop corn nearly all round, and in the center he has a flower bed. He is very proud of his garden. Will you please tell me whether it is necessary to cut the (cotton) string which I used to tie the graft to the stock in splice grafting, after the graft is united to the stock? (It is). I put on 345 grafts this Spring, of apricots, plums, prunes, apples, cherries, pears and grapes, and thanks for your instructions on the subject; I have splice and bark-grafted, nearly all of them. Some few large stocks I cleft-grafted. I also set 365 grape cuttings this Spring and last Fall. All are doing well. The dear old RURAL is certainly an educator in many ways. I would not miss it for double its cost. Respectfully yours. MRS. P. S. WISE.

Shenandoah Co., Va.

DEAR UNCLE MARK AND RURAL COUSINS:—I take my pen in hand to ask you if you will receive me as one of the cousins. If it is not too late, and I hope not, please put my name on the list. My father has taken the good old RURAL for a long time and we could not do without it if the cost of it were $3.00 a year. I have a better flower garden this Summer than last year. I planted lots of my seeds in boxes so as to have them early. Well, I must not make my letter any longer this time, if I do Uncle Mark will say, "What a letter for the first," and it will be sent into that great waste basket over in the corner. If Uncle Mark accepts me as one of the cousins, I will, in my next, write you about my plants and pets. Your niece and well-wisher, VIOLET.

Worcester Co., Mass.

DEAR UNCLE MARK AND RURAL COUSINS:—I have long wished to acknowledge the receipt of the Cuthbert Raspberry plants sent me by the RURAL. I see you have members in the Horticultural Club out of their teens and perhaps I am not too old being 22 years. If you will accept me I will be pleased and thankful. I am a great lover of flowers. Perhaps some of the cousins have never been so fortunate as to see the graceful animal, the deer. Yesterday two fawns came close to our house; they were very pretty, but a neighbor killed them. You may hear from me again; meantime good-bye. AUNT PAICENE.

Etna Mills, California.

DEAR UNCLE MARK:—I thought I would write a letter as all the other little girls are writing. I live on a farm in Kansas (mamma and my brothers and sisters and I). We have a large orchard and the trees are so nice and shady, that I have a nice cool place for my play house in the Summer. I have three dolls and lots of chickens and a little dog; his name is Ned. I make a flower garden every Spring, but my flower seeds don't come up as I want them to, and the flowers are not very pretty either; so I wish you would send me some of your prettiest flower seeds you have and oblige

Douglas Co., Kansas. ROSY ASHBY.

DEAR UNCLE MARK:—I have wanted to join your club for some time. My brother takes your paper and we all think it is splendid. I live on a farm, and would be glad to get any kind of either vegetable or flower seed. I like the RURAL very much, especially the articles on sheep raising, as I am trying to raise some. I have two motherless lambs now, don't you think that is a good start? I wish some of the cousins would write to me, I would be glad to correspond with any of them. I think it would be good practice for us to write to each other. Your affectionate niece,

Russellville, Franklin Co., Ala. ALMA ALLEN.

DEAR UNCLE AND COUSINS:—I received the seeds that you sent all right, and send many thanks for them. Our flower garden looks very pretty. The roses and other flowers are in bloom. I do not go to school now, but expect soon to have to go about a mile and a half distant. We have eight kinds of grape vines—the Concord, Isabella, Telegraph, Martha, Wilder and several other kinds. I must close now for fear my letter will be too long. So good-bye, with love to all the cousins. Your affectionate niece, LILLIE S. BABCOCK.

Norfolk Co., Va.

DEAR UNCLE MARK AND COUSINS:—It has been a long time since I have written to you. Last Summer I did not have very good success with my flowers. I received the flower seeds that you sent me and they are doing well. I received my book entitled "Donald's Schooldays," which was instructive as well as interesting. I have a darling little baby brother and sister which I spend the most of my time with. I will not make my letter too long this time. Wishing you all good-bye, I remain your niece, CARRIE B. WHEELER.

Yates Co., N. Y.

UNCLE MARK:—I live in San Francisco, but I am now visiting a friend of my father's Mrs. Winslow by name. She lives in Port Townsend W. T. Mrs. Winslow takes the RURAL and we all like it very much. I came from San Francisco all alone in a ship. There were no ladies on board, nor passengers either. The people say I am very brave to come alone. I was sea-sick seven or eight days. We were 16 days coming here. I am nine years old. GAIL HACKLEY.

Port Townsend, W. T.

DEAR UNCLE MARK:—Please may I join your Horticultural Club? I am eleven years old. We live on a farm one mile from Roanoke. I love to work with flowers. I have two brothers and one sister: Archie, Mabel and Walter. Archie and I go to school three-quarters of a mile from here. We like to read the cousins' letters. I hope you will not drop this into your waste-basket.

Huntington Co., Ind. LILLIAN E. HUFFMAN.

DEAR UNCLE MARK AND COUSINS:—I should like to join the Horticultural Club if there is space for my name. We have six sheep and had thirteen lambs, but one of them died. I have two brothers, James and Elbert. I am eleven years of age and go to school at Frankfort. If this does not find its way into the basket I will write again.

Yours truly, IDA M. HUNTLEY.

Herkimer Co., N. Y.

Sabbath Reading.

ARTLESS SIMPLICITY.—A lady visited New York city, and saw on the sidewalk a ragged, cold and hungry little girl, gazing wistfully at some cakes in a shop window. She stopped, and taking the little one by the hand led her into the store. Though she was aware that bread would be better for the cold child than cake, yet, desiring to gratify the shivering and forlorn one, she bought and gave her the cake she wanted. She then took her to another place, where she procured her a shawl and other articles of comfort. The grateful little creature looked the benevolent lady full in the face, and with artless simplicity asked: "Are you God's wife?" Did the most eloquent speaker ever employ words to better advantage?

THE richness of religious thought and sentiment may be inferred from the immenseness of its literature. If you will cast your thought over the area covered by letters, you will find that a large part of the area is covered by the arguments and experiences and reveries of religion. All along from the times of far-off Egypt to our own period, this single sentiment has said more than has been uttered by the sentiment of ambition or of love.

ABOUT a year before his death some one sent William Cullen Bryant a picture of apple blossoms. In acknowledging it he wrote: "They do not exactly suit the last day's of life's December, but they agree charmingly with that new springtime of existence, my entrance to which cannot be far off, and where I hope to find the orchards of Paradise in full blossom."

IF there be any true religion in us, it is much more likely to be discovered and drawn into actual exercise by an exhibition of the glory and grace of Christ than by searching for it in the rubbish of our past feelings. To discover the small grains of steel mixed among a quantity of dust, it were much better to make use of a magnet, than a microscope.—*Andrew Fuller.*

HAS it never occurred to us, when surrounded by sorrows, that they may be sent to us only for our instruction—as we darken the cages of birds when we wish to teach them to sing?—*Richter.*

Various.

BRIEFLETS.

IF kept clean, says the London Garden, asphalte is undoubtedly the best pavement yet discovered for crowded streets. . . . . "Justicia" who writes the interesting Leaflets in the above magazine, speaking of the great thirst of the public for variety, says that in the case of melons one may see "new" kinds brought out year after year without the slightest improvement in merit or the slightest difference from the old kinds which have been known for ages. Thus somebody raises an extra-fine specimen owing to favorable conditions of season, and immediately assumes that it is a new variety and gives it a new name. A certain number of seed houses must try it to know what it may be worth and a certain number of people order it for trial, and the result is that a small stock can be got rid of. . . . . Real progress is possible and desirable in many ways, but the christening of a melon with a new name because it happens to be a fine specimen has nothing to do with progress and is, in fact, a dishonorable practice. . . . . One individual from Jersey City writes Dr. Tanner advising him to use the water supplied to the inhabitants of that city, because it contains a large amount of meat in the shape of insects, snails and worms. . . . . While drinking some water, Dr. Tanner asked one of his watchers to take a drink with him. The proffer was declined and the Doctor then asked him if he had sworn off? . . . . . E. P. Roe sends us the following telegram: "Come see Snyder Blackberry. It is wonderful—also Cuthbert Raspberry." . . . . . Boston is making an effort, through its newspapers, to induce the school authorities to have the children of the public schools taught to swim.

CATALOGUES, ETC., RECEIVED.

THE BOOK OF ENSILAGE, or the New Dispensation for Farmers, by John M. Bailey; published by the author, Billerica, Mass.; price $2. This is a handsomely gotten up volume of 200 pages, neatly printed and bound in cloth. In it the author gives his experience with ensilage during the past year, and according to the book it has been an extraordinary success, and Mr. Bailey does not hesitate to advise his fellow farmers in the strongest terms to embark in this "new dispensation." We are of the opinion that the author attaches altogether too much importance to the system of ensilage. He paints it in very seductive colors and makes some extravagant statements, which we would be pleased to see carried out in practice. He thus states that two cows can be kept the year round in excellent condition on the ensilage grown on half an acre; that mutton can be raised for nothing if wool costs 30 cents a pound, etc. Mr. Bailey may be sincere in his statements, but we think they will certainly mislead those who unconditionally put their trust therein. Our reasons for this may be found in previous numbers of the RURAL NEW-YORKER. We describe the contents of the last half of the book in the author's own words. "I have added a short description of the herds and flocks of the 'Winning Farm' and 'Virginia Stock Farm,' together with more or less concerning the different breeds. I confess that my object is not *altogether* a benevolent desire to benefit others solely, but is partly for the purpose of advertising my horses, cattle, sheep and swine."

REPORT OF INDIANA STATE BOARD OF AGRICULTURE for the year 1879.—This is a fine volume of 560 pages bound in cloth, but printed in rather small type. It contains a report of the proceedings of the Board of Agriculture, a list of premiums awarded at the last State Fair, some able essays by professors of Purdue University and others, and also reports of the proceedings of district and county societies, with doings of several associations in the State. The appendix contains a sketch of the Indiana Pioneer Association, with the names, ages and number of years in the State, of some 240 members, all being among the first settlers of the State. The book contains much valuable information in regard to Indiana.

PAMPHLET. "Manual Labor at the Michigan Agricultural College." Spoken at Manchester and Romeo Institutes. By Pres. T. C. Abbott. President Abbot is the best possible authority on the labor system, as it has been practiced for many years at the institution of which he is the head. He has been a keen observer of the physical, intellectual and moral results of manual labor upon student life, and in this lecture he has given the question a brief and impartial examination, from which only one conclusion can be drawn, and that is that manual labor, in agricultural colleges, is both practicable and necessary to fit the student for his work in after life.

PERSONAL ITEMS.

L. M. Kallock, Charles De Young's murderer, was arraigned for the crime at San Francisco Saturday. A motion to set aside the indictment will be argued in a few days.

Among the ancestors of M. Challemel-Lecour the French Ambassador to England, were two fraudulent bankrupts and a forger. He has had, on that account, no little trouble in obtaining recognition of his talents and public services.

During the debate on the Reform bill in 1850 Mr. Gladstone pointed to six men who, all entering the Parliament young, succeeded in becoming leaders of the House. Mr. Pelham entered at 22, Mr. Pitt at 21, Mr. Canning at 22, and the first Sir R. Peel at 21. Gladstone himself entered at 21.

The queen of Siam and the king's favorite child were drowned on the night of June 1, a picnic boat on which they were sailing being run down by a steam launch. Nearly all her attendants also perished. The bodies have been recovered and Bangkok, the capital, is plunged into mourning. The king is nearly distracted with grief.

The last election in Ireland was a poor candidate's triumph. In Sligo Mr. Sexton, a journalist defeated Mr. King-Harmon, Lord-Lieutenant of the county, an immense land-holder. In Roscommon the O'Connor Don, though of ancient Irish stock, holding large estates, and supported by the Roman Catholic clergy, was defeated by Mr. O'Kelly, another journalist.

M. Jules Ferry, the French Minister who introduced the bill for the expulsion of the Jesuits from France, is the direct descendant of a man who, 120 years ago, established several houses of the same order in that country. M. Ferry's ancestor having lost his wife, joined the order of the Jesuits, and after studying at the Jesuits' college at Rome, was ordained a priest. He returned to France one of the most ardent followers of St. Ignatius. His name was also Jules. The present Minister is the great-grandson of the son that this reverend father had had before he embraced the monastic career.

A Turkish journal, commenting on the elevation of Mr. Gladstone to the Premiership, asserts that he was a Bulgarian, "His father was a pig dealer in the Valley of Kustendje," says this veracious chronicler, "and young Gladstone ran away at the age of sixteen to Servia, and was then with another pig dealer, sent to London to sell pigs. He stole the proceeds, changed his name from Trogadelr to Gladstone, and became a British subject. Fortune favored him until he became Prime Minister. Gladstone has no virtues." The Turks don't love Gladstone very much; but the writer of that biographical sketch must have read a good deal about American Presidential candidates in our political papers about election time to be able to concoct such a "life."

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

Humorous.

A DRINK for the sick—well water.

A CRUEL husband calls his wife "green fruit," because she never agrees with him.

IT will take a pretty heavy frost to kill this speech crop that is coming on now.—Corry Press.

"How sad!" exclaimed one blade of a pair of scissors to the other; "how sad! We only meet to sever!"

"YOU never saw my hands as dirty as that," said a petulant mother to her little girl. "No, but your ma did," was the reply.

THE compositor who set up "pimpled chops" for "dimpled checks" didn't look a bit natural in death.—Modern Argo.

"CAN tough fowl be made tender?" asks a housewife. Certainly; in many boarding-houses the boarders find the landlady tenders tough fowl.

"TOM," said a girl to her sweetheart, "you have been paying your distresses to me long enough. It is time you made known your contentions, so as not to keep me in expense any longer."

"How came you to fail in your examination?" asked the tutor. "I thought I crammed you thoroughly." "Well, you see," replied the student, "the fact was you crammed me so tight I couldn't get it out."

AN old Highland clergyman, who had received several calls to parishes, asked his servant where he should go, the servant said: "Go where there is most sin, sir." The preacher concluded that was good advice, and went where there was most money.

"How do you pronounce s-t-i-n-g-y?" Professor Stearns asked the young gentleman nearest the foot of the class. And a smart bad boy stood up and said it depended a good deal whether the word applied to a man or a bee. Go to the head young fellow.

A LITTLE fellow, turning over the leaves of a scrap book, came across the well known picture of chickens just out of their shells. He examined the picture carefully, and then, with a grave, sagacious look, slowly remarked, "They came out 'cos they was afraid of being cooked."

"ARE animals color-blind?" asks a scientific journal. Well, our opinion is, if that querist were to put on a red shirt and undertake to go across a lot containing a bull, he could most satisfactorily answer that question without submitting it to the press.—Waterloo Observer.

A DROLL fellow fished a rich old gentleman out of a mill-pond and refused the offer of twenty-five cents from the rescued miser. "Oh, that's too much!" exclaimed he; "tain't worth it!" and he handed back twenty-one cents, saying calmly, as he pocketed four cents, "that's about right."

GOING home from church, she remarked to her husband: "Did you notice that bald-headed man in front of us, and how young he looked? I never saw any one so young before with a bald head." Then he shut her up by replying: "My dear, I was bald-headed before I was a year old."

"LOOK heah, squire, dars a niggah in Galveston what's been sassin' me; supposing I jes maul de life outen him?" The lawyer replied: "You would be apt to get your neck stretched." "Now, boss, you is jokin. What do white folks care for one niggah moah or less now de census is done tuck!"

A DARKEY who was stooping to wash his hands in a creek, didn't notice the peculiar actions of a goat just behind him; so, when he scrambled out of the water and was asked how it happened, he answered: "I dunno 'zactly; but 'peared as if de shore kinder h'isted and frowed me."—American Punch.

How beautiful is night! How silently she tiptoes across the meadows of yonder peaceful vale. I hear, in fancy, the soft rustle of her shadowy garments as they trail above the—blank, blank, the blankety cats! There they go again! When a fellow does feel a little touch of sentiment, there's always something to startle him back to the stern realities of life.—Kokomo Tribune.

A Kind of Torpor

Sometimes afflicts the kindneys and bladder which, if prompt measures are not taken to overcome it, seriously jeopardizes their health, and often proves the forerunner of irremedial disorders. The diuretic properties of Hostetter's Bitters, which stimulate these organs without irritating them, peculiarly qualify it to avert all danger to be apprehended from the condition described. It encourages secretions when deficient, and aids the discharging functions by invigorating the urinary organs. While the stimulants of commerce exert an effect somewhat akin to the Bitters upon the kidneys and bladder, their fiery properties, being modified by medicinal ingredients, have a tendency to unduly excite, but the potent and salutary vegetable extracts with which the stimulative property of this medicine is combined, constitute it a safe as well as an effective preparation. As a general invigorative and alterative, also, it possesses very great popularity.

"DARWINIAN."

Our village grocer (great Floriculturist).—"Most extr'or'nary thing, sir. Last year I had some bacon in my shop that went bad durin' that hot weather, and I buried it in my garden. You'll hardly believe it, but all my Asters this season came up streaky!"

Biographical.

THEODATUS TIMOTHY LYON.

Theodatus Timothy Lyon, the subject of this sketch, was born at Lima, Livingston County, New York, on January 23rd., 1813. His father was Timothy Lyon, for whom he was named. The family emigrated from Connecticut to Western Massachusetts, and in the early settlement of the "Genesee County" removed and settled in Lima.

His mother, Mary, was the daughter of Jonah Davis, a farmer, who early emigrated to Lima from Delaware County, New York. His father owned and carried on a farm, but devoted his attention mostly to architecture and millwrighting. From the age of about twelve years, T. T. Lyon's Summers were spent partly at farming and partly at mechanical work, he having developed a considerable liking for machinery. Aside from such employment his time was spent in a district school up to the Spring of 1828, at which date his school privileges were brought to a close by removal with his father to the then remote and wild Territory of Michigan, where this family settled at Plymouth about twenty miles northwest of Detroit. About the year 1826 or 1827, on visiting the grown-up orchard of a neighbor, he found the owner in the tops of his apple trees employed in inserting buds in the smaller branches. On returning home he procured and sharpened a case-knife and proceeded to cut buds from a favorite apple tree, and insert them in the limbs of other trees in the farm orchard, thus taking his first lesson in practical pomology.

During his first year's residence in Michigan, he was employed in "tending" a small country store established and conducted by his father at Plymouth. His employment was afterward for a time diversified by carrying the mail, on horseback, the route extending from Tecumseh, in Lenawee county, to Maumee, then a part of Michigan, but now belonging to Ohio, on the one hand, and Pontiac, in Oakland county, on the other; with a weekly trip to Monroe, in Monroe county, at that time but little more than a French village. In obedience to the earnest desire of his parents, in the Spring of 1836, he gave up his long-cherished purpose of pursuing a course of study, and returned to Michigan from a visit to his old home in Lima, N. Y., resuming the business of selling goods and teaching school, and finally turning his attention to farming and manufacturing lumber, occasionally filling the position of township clerk and school inspector.

On December 6th, 1838 he was married to Miss Marilla Gregory, daughter of Mr. William S. Gregory, long a prominent farmer in Plymouth. In 1842 he spent a year at the Wayne county poor-house, in charge of the establishment as keeper and farmer. In 1844 he commenced a small nursery at Plymouth, mainly with the purpose to grow a supply of trees for his own planting, as he had, in compliance with the wishes of friends, abandoned the idea of going further West to carve out a new home in the wilderness. He collected the varieties for the nursery from surrounding orchards, accepting the names by which they were commonly known. He soon learned the fact that in so doing he had, in many cases, incorrect and local names; this started him upon the process of correction and identification.

Such a work is likely to grow upon a person, and, in the case of Mr. Lyon, this proved not to be an exception to the rule. He soon saw the need of a broader knowledge, and amid the toil and care of business he entered upon the study of the limited pomology of thirty years ago. A series of articles in a Western paper prepared by him, describing the apples known and valued in Plymouth and vicinity, attracted the attention of Mr. Charles Downing, of Newburgh, N. Y., and brought about an acquaintance between the two persons. From Mr. Downing's trial grounds at Newburgh, he was enabled to obtain numerous varieties of new and comparatively untested fruits and, having a decided *penchant* that way, and his recently planted orchards being in the right condition for the purpose, he indulged extensively in the testing of novelties as a matter of personal and public satisfaction but with little, if any, regard to profit. The valuable test orchards at Plymouth are the outcome of these experiments.

From 1861 to 1865, under a Republican county administration, he held the position of member and Secretary of the Board of Superintendents of the Poor of Wayne county, and was continued one year as Secretary by the succeeding Board of Democratic County Auditors.

THEODATUS TIMOTHY LYON.—Fig. 262.

On June 17th, 1864, the Detroit and Howell Railroad Company was organized and Mr. Lyon was elected President. This was followed April 13th, 1867, by the organization of the Howell and Lansing Railroad Company, and, as both were parts of the same line, Mr. Lyon was elected President of this also. This position he held till, in 1870, and 1871, the roads were turned over to an Association of Boston men. As a consequence of his connection with the railroads, his attention was diverted from the subject of pomology, and the care of his orchards was mostly delegated to other hands. This arrangement was hastened by the failure of his wife's health, together with the final sickness and death of her parents.

On the completion and opening of the Detroit and Lansing Railroad and its consolidation with the line from Lansing to Ionia, Mr. Lyon's connection with it ceased, leaving him without special employment, but on account of the continued feeble health of his wife he was disinclined to return to the farm.

At this juncture strong inducements were offered him to remove to Western Michigan, and resume his former pursuits, which he did in 1874, becoming connected with the Michigan Lake Shore Nursery Association as its President. This enterprize was inaugurated at an inauspicious time; and, as a consequence of the subsequent shrinkage of values, together with the failure of a large number of the subscribers to the capital stock to fulfil their engagements, it has been thought best to dissolve the corporate organization.

In December 1876, Mr. Lyon was elected President of the Michigan State Pomological Society, to which position he has been annually re-elected up to the present time. He was also for two years a member of the Executive Committee of the Michigan State Agricultural Society, and at three different times the delegate of that Society to the sessions of the American Pomological Society.

These, and various minor positions of similar character, together with the supplying occasional matter for the press have entailed upon him a voluminous correspondence, drawing largely upon his time and energies, but with little direct advantage to himself. Mr. Lyon is a walking cyclopedia of the nomenclature of fruits, and can identify all the leading varieties of Western fruits at a glance, and Michigan is greatly indebted to him for his long and persistent labors of love in this direction. J. C. H.

Farm Economy.

A SCIENTIFIC VIEW OF COMPOSTS.

PROFESSOR F. H. STORER.

In case the fermentation of a compost heap becomes so active that there is danger of losing fertilizing materials, it may sometimes be well to turn over the heap, with addition of new portions of peat or some other inactive material; and, on the other hand, by forking over compost heaps after the first fermentation has run its course, so that air may be admitted and the materials be thoroughly mixed, the fermentation may be renewed and carried much further towards completion than would otherwise have been the case. But, in spite of the well-known fact that composts gain very decidedly by the process of forking both as to the chemical activity and the mechanical condition of the product, it seems to be questionable whether much forking is justifiable from the economic point of view. Repeated forking may be proper enough when the compost is to be used for horticultural purposes, and the object is merely to provide the best possible food for some fastidious plant; but for the general uses of a farm it would seem to be better not to refine the compost too much, but to rest content with bringing it to a fairly good condition. In this sense the establishment of new heaps and the procuring of ample supplies of material for their construction, would seem properly to take precedence of the system of frequent forking which was formerly in repute. It is to be hoped that the methods which have occasionally been proposed of stirring compost heaps with plows, harrows and road scrapers may be so systematized and improved that they shall meet all reasonable requirements, and that the method of forking by hand may be reduced to the lowest possible limits. It might even be possible to devise some simple method of forking by horse power which would supersede the manual operation.

Composts prepared in the manner above suggested have several good qualities which are peculiar to them as a class. As compared with barn-yard manure they are convenient of application, whether to plowed land or to grass, and they are easily incorporated with the soil. One good way of looking at a finished compost is as loam highly charged with fertilizing ingredients, *i. e.*, as a "saturated earth," fit to be strewn directly in the hills and furrows in which seeds or plants are to be placed. A good compost is both *strong* to promote growth and *mild* in that it will not hurt seeds or young plants. On the other hand, when comparing composts with the commercial fertilizers, we have to inquire, in the first place, what the nitrogenized constituents have cost in either case, and there seems small room for doubt that, in very many instances, all things considered, the compost-nitrogen which has been made, as it were, at the farm will be found much cheaper than that bought in the form of a chemical manure. Furthermore, the water-holding power of the compost must be considered, since in droughty seasons, and particularly on light land, it may be a point of no small importance. It may, indeed, happen in some cases that the position of a man's farm as regards moisture may of itself determine whether it is best for him to use commercial fertilizers or composts. It is manifest that many a bottom-land abundantly supplied with moisture might be as grateful for the application of commercial fertilizers as many of the light upland gravelly and sandy soils of New England have been found to be for composts. It is tolerably plain, at all events, that in situations liable to drought composts are, in general, better fitted than most commercial fertilizers for promoting that peculiar moist mellowness of the soil which is an esteemed

condition of fertility. They act, too, as a mulch in some sort, and keep the soil from "binding." It is to be remembered, withal that besides its power of holding water, the presence of mere humus may be advantageous in other ways in some situations.

There is yet another highly important item to be mentioned in respect to composts, namely, that when kept for some little time in heaps, or mixed with the soil in which crops are growing, or spread upon grass land, they become true "niter-beds" in which saltpeter and other nitrates are formed from the nitrogen of the peat which in its natural state and but for the composting would, with some rare exceptions, have had little if any value in this sense. The discovery a few years ago that nitrification is, in its turn, a peculiar kind of fermentation, due to the presence of living organisms, has thrown a flood of light upon the action of organic manures in general, and of composts in particular, and has shown very clearly why old composts were formerly so much esteemed. In the days when the use of active nitrogenous manures like guano, nitrate of soda and sulphate of ammonia, was unknown in agriculture and horticulture some of the effects now obtained by means of these chemicals were got by the use of compost so thoroughly rotted that it was really a weak saltpeter earth. The old custom of frequently forking over the heaps was justified by the end in view, and it is a point still to be determined whether the heaps had not better be made of different sizes at the two stages of putrefaction. For the nitrification stage more ready access of air may be needed than would suffice for the earlier fermentation. Since a fair supply of moisture is needed at both stages, it is well to establish compost heaps in places where the materials will not dry off too rapidly. Moisture and warmth are essential conditions of nitrification, as well as an abundance of air.

Nowadays it is probably more rational not to keep compost long, but to use it as soon as the early or putrifactive fermentation has been carried far enough to thoroughly "cure" the peat and disorganize the materials so that they shall be, mechanically speaking, fit for use. The subsequent nitric fermentation will then go on in the fields, after the compost has been applied to the soil. By proceeding in this way the peat may be made to supply to the crops the best kind of nitrogenous food gradually and continuously throughout the growing season. Since warmth is known to be favorable to nitrification, it will be of interest to inquire whether composts had not better be applied by preference to hot weather crops, such as Indian corn, for example. It is known already, for that matter, that corn does prosper upon, and readily put to use, the nitrogenous food that is supplied by good humus. An old compost heap that has been well cared for must be filled with the organisms which cause nitrification, in the same way that the poudrette formerly made outside Paris and other cities was filled with them. It is but a few years since the reproach was made, as against the chemist, that a small quantity of poudrette placed in a hill of corn made the crop show a color and vigor of growth which no chemical analysis of the material had accounted for. But the seeming mystery has lately been made plain, and we now have every reason to believe that the chief merit of the poudrette depended upon the living things within it, which caused the nitrification of the humus of the soil, and so fed the crop.

The merit of composts for top-dressing grass lands is another point to be kept in view when contrasting them with commercial fertilizers. There are probably many situations where it will profit the farmer to use compost upon his hay-fields, although the application of commercial fertilizers is, economically speaking, quite inadmissible. There are several reasons, besides the comparative cheapness of the compost, why this fact should be true. The compost covers the ground sufficiently to smother moss, and its particles fall into the spaces between the grass plants in such wise that they do good considered as mere earth. It has often been noticed that many grass fields, and particularly those which are mossy, do profit considerably by applications of mere dirt, such as road-dust or the like. But the earth of a well-prepared compost is true humus, and as such is specially well fitted for the use now in question. The significance of the earthy compost considered as a mulch, has already been alluded to, and so has the slow but continuous nitrification of the compost earth which is most advantageous for the grass. In the case of composts prepared with lime or marl, a specially beneficial action is often noticed, due to the correction of a certain acidity in the land which hinders the growth of the better kinds of grasses and favors the introduction of inferior vegetation.

One important circumstance which has been lately noticed should be kept in view when considering the nitrification of composts, viz.: that the nitrifying ferment needs a large quantity of carbonaceous food in order that it may prosper. (See page 172 of the RURAL, for March 13.) Here probably is one of the reasons why peat and humus in general are so well suited for making composts. From this point of view it may be seen that even those kinds of peat which are not particularly rich in nitrogen may still be fairly useful in compost making, when the heap is to be carried to the nitrification stage, or so used that nitrification may result from its use in the fields. The use of sawdust for composting may be considered under this head, and there are some facts of experience which justify us in so considering it. Excellent results have been obtained in Germany by composting bone-meal with sawdust and allowing the moistened mixture to ferment before applying it to the land; and comparative field experiments have shown not only that the bone-meal thus composted gave better crops than the plain meal, but that the compost could justly be regarded as a cheap source of nitrogenous food. It may be said, it is true, that the sawdust acts beneficially in the first hot fermentation—either to procure or to mitigate it—and that the carbonic acid which results from the oxidation of the sawdust works to dissolve the bone earth: but there is room for believing that the sawdust is useful also in the nitrification stage. The question is well worth studying whether sawdust and peats poor in nitrogen may not perhaps be as well suited as the richer peats for composting with bone-meal and with highly nitrogenous matters, such as fish, flesh, and slaughter-house refuse. It is not impossible that when thrown directly into the barnyard, *i. e.*, when "used as absorbents," the carbonaceous character of the materials may be as important as the proportion of nitrogen contained in them. In this view of the matter the esteem in which sawdust is held as bedding for milch cows may depend, in some part, upon the character of the resulting manure, and not alone upon the cleanliness of the animals bedded with it, as has sometimes been supposed.—[To be continued.

MANUFACTURE OF PHOSPHATES.

T. H. HOSKINS, M. D.

THE great hindrance to a general and much more extensive use of manufactured fertilizers is unquestionably their high cost compared with the return. So long as Eastern farmers are compelled to compete with the unmanured products of the Western virgin soils, they must have cheap fertilizers if they are to use them at a profit. We may be assured that they neither will nor can long use artificial plant food upon their crops at a loss or without profit. And yet the manufacturer, too, must make a living profit. How can these two interests be reconciled? Being obliged, in my own farming operations, to depend mainly upon purchased fertilizers, I have studied the subject with a lively interest for a dozen years or more. I have experimented much in the making of fertilizers, and have visited some of the largest manufacturing establishments, and conversed freely with the proprietors on this matter. I got very little satisfaction out of the study and inquiry, but settled down to the use of pure ground bone, mixed with three or four times its bulk of unleached hardwood ashes, made pretty wet in tight casks or boxes for a month before using. More lately, dissatisfied with the high cost and uncertain purity of ground raw bone, I have resorted to the use of fine bone-ash, made on my own premises, and mixed with dry ashes, using sulphate of ammonia in the mixture or separately as the nitrogenous element. I am satisfied that for myself either of these methods is cheaper than the purchase of commercial fertilizers, whether superphosphates or formula manures. But I do not like the "bother" of this home manufacture, and would gladly pay a reasonable price to have the work done for me by those who make a specialty of the business.

There is one point connected with the manufacture of fertilizers in which I think a great mistake has been made. I refer to the relative values attached, in analyses and estimates, to the different forms of phosphatic material. Thus, in the report of the Connecticut Experiment Station for 1878, page 19, we have the following table of "Trade Values":

	Cents per pound.
Phosphoric acid soluble in water	12½
" " "reverted" and in Peruvian guano	9
" " insoluble in fine bone and fish guano	7
" " in fine medium bone	6
" " in coarse medium bone	5½
" " in coarse bone, bone ash and bone black	5
" in fine ground rock phosphate	3½

Practical experience has taught me that no such difference in agricultural value exists between these different sources of phosphoric acid as is here set down. I regard the phosphoric acid of reverted superphosphate as in no degree less effective upon crops than the phosphates so manufactured as to be soluble in water. Ground bone, after being treated with ashes as above alluded to, is also equally effective with the soluble superphosphate, used with an equal quantity of ashes on the crop. This opinion is the result of many careful experiments, varied in method, and upon various crops, for a series of years. Bone ash, finely ground, is also nearly as effective as soluble phosphate, and I should not estimate its value (rating the soluble form at 12½ cents for its phosphoric acid) below 9 cents for the phosphoric acid it contains. The South Carolina phosphate I have not experimented with; but I see no reason why it should not, when very finely ground, be pretty nearly equal to bone ash.

The objection made to the less soluble phosphates is that they are not so uniformly distributed through the soil, and are not so immediately available as plant food. The difference in cost, as above estimated, is, however, much greater than the difference in value on this account, while there is serious objection to the very soluble form of the fertilizer in the fact that its acidity makes it injurious to the plant in its early stages of growth, while on light soils such extreme solubility renders the phosphoric acid liable to be carried too deeply into the soil. But there are other weighty considerations. In very high culture, and especially where there is constant succession of tillage crops only, immediately available plant food in liberal quantity is required. But when we come to look at the needs of the average farmer of the Eastern States, whose objective point is almost uniformly grass, and whose tillage crops are preparatory and subordinate to the grass crop, we see that extreme solubility in a fertilizer is objectionable.

I take up, for instance, a piece of mowing or pasture on which the grass has ceased to give a profit, and put it through a rotation, say of corn, potatoes, and wheat, seeding it again to grass with the last crop. The decaying sod, with a moderate application of an ammoniated superphosphate in the hill, will usually give a pretty good crop of corn. If the soil is light and the sod very thin, a dressing of ashes may be needed. Next year I plant the field to potatoes, using a liberal quantity of a "potato fertilizer" containing a good allowance of soluble phosphoric acid and German potash salts, with some nitrogenous material. Next year I seed to grass with wheat, using a "wheat fertilizer" composed of a soluble phosphate and a liberal supply of nitrogenous material, with a little salt and potash. I have a good crop of wheat, but what have I left in the ground for the succeeding years of grass from which I mainly expect to derive my profit? Almost nothing. The land is not bettered at all by the three years' course of tillage. It gets a fresh *seeding*, and may, for one or two years, give me more grass than when it was broken up, but that is the end of it.

Now, going by the Connecticut "Table of Values," let me apply an equal *cost* of phosphoric acid in fine ground bone, bone ash, or South Carolina phosphate, together with the same amounts of potash and nitrogen, to my corn, potatoes, and wheat. These three crops, according to my own experience, will be equally good, and the grass will be more than four times better. On a light soil I should steal 25 per cent. from the cost of the phosphatic material and spend it for ashes or potash salts. Under this treatment we shall apply more than double the quantity of phosphoric acid to the field, one-half of which would be taken by the tillage crops and the rest be left for the grass, while the expense would be the same.

Farm Topics.

WESTERN FARMING.—XI.

W. I. CHAMBERLAIN.

Colorado Agriculture.

SOME enthusiastic Colorado professor of agriculture wrote lately, if I remember, to one of our Eastern agricultural papers that if Eastern farmers could see the wheat grown in Colorado by irrigation, they would never want to raise wheat in any other way. Such, at least, was the impression left on my mind. There have been reports, too, of 70 bushels or more of wheat per acre raised by irrigation. And Colorado farmers, more enthusiastic than reverent, have declared that with a good irrigating ditch they were not particularly dependent on the Almighty for good crops. Apparently the Lord heard the remark, for there was neither rain nor snow in a large part of Colorado from last August till late in May of this year. The result was that the ground was too dry to sprout the seeds in Spring, and when farmers and even gardeners tried to sprout and bring them up artificially, they wholly or partially failed. The newly plowed ground, when flooded from the irrigating ditches, became too wet, and then, from its strong alkaline nature, baked in the sun and crusted over, so that even the robuster kinds of seeds partially failed, and the more tender kinds failed entirely. A friend of mine in Denver, for example, lost all the labor on five acres of onions, because the tender seeds could not be made to come up by irrigation, even by the most patient and skillful labor. I visited many farms and market gardens near Denver, Colorado Springs, Pueblo, Canon City, Fort Collins and Greeley, and cannot report enthusiastically on Colorado agriculture and horticulture. It is, of course, an unfavorable year, for the fact is farmers need, and till this year have usually had, enough moisture in the soil in Spring to bring the crops well above ground before artificial irrigation is begun. This they now frankly admit; and I heard a man (more noted for his shrewdness and good sense than for any abnormal development of the bump of reverence) remark: "If the Almighty would treat us only half-way decently in the Winter and Spring, so as to get the crops above ground, we would be much obliged, and get along through the Summer alone!"

But, after all, irrigation is a slow and expensive mode of raising crops, and the soils of Colorado are not rich except in alkaline matter. They are the newest soils in our land, and hardly half-decomposed from the primitive rock, as your own eyes show you everywhere you go here. There is little rain and little natural growth and, of course, little vegetable mold. And to attempt to put Colorado in comparison agriculturally with the rich and abundantly-watered plains and prairies of Illinois, Iowa and Eastern Kansas and Nebraska, is obviously unjust. The wonder is that *any crops at all* can be raised on this soil and with this climate. There is a census enumerator out West who some years ago had both arms shot away, the stump being then amputated near the shoulders. He learned to write by holding the pencil between his teeth, and took the census well, though not so rapidly as some who had both hands. But it was a wonder he could do it *at all*. Just so, Colorado agriculture seems to me to be robbed of both its arms—the rainfall and the vegetable mold formed by ages of growth and decomposition; and to attempt to make Colorado surpass Illinois in agriculture is claiming far too much.

Then, too, the area of possible agriculture in Colorado is small. The total area of the State is 66,000,000 acres, and of this vast area only 4,000,000 acres, or *one-fifteenth part*, are such as to render agriculture at all possible on it. A part of this consists of mountain valleys naturally watered; but the most of it should be irrigated from mountain streams; and the latter are only sufficient for the area named. Then, too, the Rocky Mountain locusts, or grasshoppers, make their ravaging descent about once in two years on the average, so that perhaps it is not strange that only 200,000 acres, or *one-three-hundredth part* of the area of Colorado is now under actual tillage. I do not include the vast areas on which the stunted Buffalo grass grows almost without moisture, and which are grazed by great herds of cattle. But those Colorado steers are lank and bony so far as I saw them, and do not compare favorably with the well-fed cattle of fertile Illinois. Some large cattle figures are given, however. For example, a certain Denver lady whose name I cannot recall (though I remember to have heard her called the princess of Colorado graziers) is said to have sold last year $170,000 worth of cattle and still maintained, by increase and growth, the size of her herd. If she did, she must have a great many thousands of steers, and graze a great many tens of thousands of acres of land. My informant said her ranches were all irrigated.

High local prices favor agriculture and horticulture proper. Raspberries and blackberries were from 40 to 60 cents per quart and new potatoes eight cents per pound and other vegetables in proportion. Even hay, grain and other heavy products of agriculture are exceedingly high. This is partly due to the great influx of mining population to Leadville and the Gunnison and other mining regions, and partly to the heavy rates charged by the railways for long, local west-bound freights. Whether these high freights are for the present necessary or wise I do not feel called on to offer an opinion. They are, however, like the tariff to manufactures in a new country, the very life of young agriculture. But I venture the prediction that in time a wholesome competition will bring down the rates of railway freights, and, of course, agricultural products will pour in from the richer plains and better watered climates, and Colorado agriculture and horticulture will then be chiefly confined to the production of articles not easily transported either on account of their bulk, difficulty in handling, or their perishable nature.

But, considering the great obstacles to be overcome, the progress made in agriculture in Colorado is exceedingly creditable, and if she could be cut off from communication from the gentile world as long as Utah was, her agriculture by irrigation would doubtless arrive at the same stage of advancement. But such isolation in this age is neither possible nor wise.

Denver, Colorado.

Arboricultural.

ARALIAS.

WILLIAM FALCONER.

ARALIAS grow wild in Europe, North America, Japan, Eastern and Southern Asia and the South Sea Islands. They consist of trees, shrubs and herbaceous plants, and are valuable, some on account of their ornamental character and others because of their economic use. Our native aralias, as the Ginseng, Dwarf ginseng, common Wild sarsaparilla and Spikenard, are common in rich woodlands; the Bristly sarsaparilla prefers rocky places, and the Angelica tree or Hercules Club is found along our Southern river banks.

The Angelica tree is grown in gardens for its sub-tropical appearance and its immense compoundly-panieled umbels of white flowers. A. Chinensis, from Northern China, and A. cordata, from Japan, closely resemble the Angelica tree and are cultivated for the same end. In European sub-tropical gardens they are extensively used, the Angelica tree the most so.

The Spikenard, on account of its ornamental appearance when laden with fruit, sometimes gets a footing in our gardens; but it is not worthy the place. A. papyrifera, the Rice-Paper Plant indigenous to the swampy forests of Formosa, is also highly favored for sub-tropical work, and although not hardy in the North, it winters well in a frame, pit or cellar. The stems may be all winter-killed, but so long as the fleshy roots keep plump and fresh, so long can a numerous stock be raised. Little pieces of the roots, as in the case of bouvardias, produce goodly-sized plants in one season.

A. Japonica, has large, deep-green, glossy leaves, is a common plant in cool greenhouses, a pretty ornament in the Summer garden, and a second-quality window plant. It is not hardy here. It is hardly choice enough for a small plant collection.

Among the economic uses of the aralias, the famous Chinese rice paper, made from the pith of A. papyrifera is conspicuous. My neighbor, Dr. Henry P. Thayer, at his extensive laboratories at Cambridgeport, manufactures a fluid extract from the American sarsaparilla (A. nudicanlis) that is gently stimulative and alterative; one from the bark of the root of the Dwarf Elder (A. hispida), of diuretic and alterative propensities; and another from the root of the Spikenard (A. racemosa), that is aromatic and alterative and which is used in pulmonary diseases.

But the most beautiful kinds come from afar—India and the South Sea Islands. Many of these aralias, as Veitchii, Guilfoylei, elegantissima, maculata, armata and the like, are valuable and highly decorative greenhouse plants seldom met with outside of our choicest collections of tropical exotics. They are mostly shrubby and always prettiest in a young state—say when two to five years old. But what are we to do with such costly plants after they grow up leggy and bare and in a measure lose their comeliness? Cut them back and use the branchlets as cuttings and cions for grafting. Those who propagate the finer, hard-wooded aralias sometimes experience difficulty and delay in attaining this object; hence the finer sorts will always be expensive.

In habit and leaf form these exotic aralias vary more than do the wildlings of our own woods; A. filicifolia, for instance, has ample, fern-like leaves; reticulata, strap-shaped; elegantissima, digitate with slender, thread-like leaflets, and so on. The color of the leaves also differs materially in the different species. Some are deep-green; others olive-green, bronze, spotted and blotched, or maybe margined with white or whitish yellow.

Aralia monstrosa, the subject of the annexed illustration, is one of the handsomest of the genus. It is a "new" plant, recently introduced from the South Sea Islands and is now being disseminated by Mr. B. S. Williams, of London, England. Mr. W's description of the plant is; "leaves pendant, primate, having three to seven oblong elliptic leaflets deeply and irregularly serrated. The leaflets are broadly margined with creamy white, the surface blotched with gray." He quotes the price of each plant at one guinea—about $5.25. But I assure you a plant as vigorous as that represented in the illustration, and as well furnished, and in first-rate condition in every way, cannot be sold at a profit in New York to-day for twice, and I question if it can for thrice, that amount.

I will take this opportunity of again reminding RURAL readers that it is their duty to encourage home enterprise. Why is it that an Englishman can buy a plant in London for $5, that will cost an American $10 in New York? Simply because the American prefers to patronize a foreign market and pay high prices together with duties and other expenses, and accept risks as well, rather than to deal with the nurseryman who lives in his own city. True, our nurserymen do not keep many of the more expensive "new" plants, because they are not justified in doing so. But by your patronage impress upon our nurserymen that you will buy your plants at home rather than abroad, and you will find men and capital, too, at home that will penetrate the uttermost ends of the earth to procure "new," choice and unheard-of exotics to supply your wants. Then you may expect to purchase plants at first cost, without the burden of trans-Atlantic expenses, customs, and other items that swell your bill some one-third or half the price of the plants. Besides, we will banish the life-risk of the plants—the greatest barrier of all.

Pomological.

SIMONS'S RED APPLE.

SIZE, medium to large. Form, oblate, tapering to the apex; sides unequal. Flesh, medium fine, pale yellow or yellowish-white, tender, moderately juicy, nearly sweet or mildly subacid, with a pleasant aromatic flavor. Core, rather open. Seeds, light brown and of medium size, pointed. Calyx open, in a deep basin. Stem short and small, set in a very deep, open cavity. Color, crimson, dark on the sunny side, but lighter in the shade, with somewhat obscure but darker stripes throughout, and clear, deep russet around the stem and calyx, and russety specks covering the whole surface. Quality, "very good." Ripens in Georgia the last of August and beginning of September.

It is said to produce regular crops. It is a wilding, having been found growing in the woods in Macon County, Georgia.

Our Early Peaches.

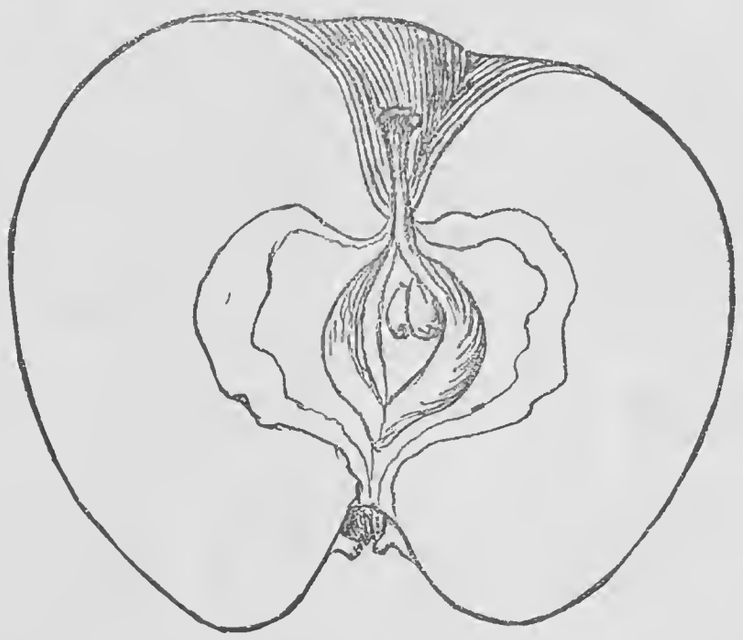
The Amsden and Alexander peaches began to ripen July 18, and were followed closely by the Beatrice, Louise and Rivers. Amsden appeared a trifle larger and better than Alexander; both are very productive and sold at Rochester for $1.25 per basket of 12 quarts at first; but the price declined subsequently. Beatrice was nearly as large as the above, more highly colored, and of better quality, but sold at the same price. It did not rot at all, while the others did somewhat. Louise came a few days after Alexander; it is about the same size, but of better quality. Rivers is a light cream color much the largest of the above, but not very productive. In quality it did not meet my expectations. The red cheek spoken of in the catalogues was wholly absent.

I have the Schumaker peach, said to be four weeks earlier than the Alexander, but it is not in bearing. The leaf is very bright and healthy. I state this fact on account of the hint, thrown out from a certain quarter, that these very early varieties produce fruit prematurely simply for the reason that they are attacked by the yellows. I have escaped this trouble entirely. It does not do much injury on our strong loamy soil. CHAS. A. GREEN.

Monroe Co.

The Early Sweet Water Peach.

LATELY on some of the fruit stands about the city could be seen quite a quantity of this old-time favorite, early peach. Many years ago this variety was considered the best of the very early peaches in this neighborhood, ripening about the first week in August. It was largely supplanted by Hale's Early, on account of its color, the Sweet Water being pale white and Hale's Early a deep red. Everybody planted the latter, and everybody wished it had never come into existence, for more money has been lost by it than was ever made by it. If a wet day, or even a good shower comes when the fruit is ripening, it immediately commences to rot, and the larger part of the crop is lost. In Delaware whole orchards of it have been grubbed up and used as firewood. This only shows the folly of abandoning well-tried, standard fruits for the untried novelties continually coming up. Great caution should be used in such cases, and a few experimental trees planted and tried before planting large orchards of them. JAMES HOGG.



SIMMONS'S RED.—FIG. 263.

Small Pears and Apples.

It is a prevalent idea among fruit growers that for marketing purposes large pears and apples are the most salable. However this may be with late Autumn and Winter fruit, it is not really so with the Summer and early Autumn varieties. During the Summer and early Autumn the markets are supplied with berries, plums and peaches, grapes and melons which people largely use and only need pears and apples to make up a larger variety of table fruit The large hotels at the watering places and in our large cities have to supply their tables with everything in season, and require a large variety of fruit. A guest at one of these hotels will take a peach, or a plum, or a few grapes, or a slice of melon, and may wish a pear or an apple. If either of these is large, he simply cuts out a quarter and leaves the rest. This, of course, is a loss to the hotel proprietors, as it has to go down to the servants' room. We have heard them complain of this, and say that Bartlett pears were the most costly fruit they had on their tables on this account, and that Seckel pears at the same price per bushel were far cheaper in the end. Fruit for hotel use should be bright-colored; that is to say, yellow or red-cheeked pears or apples are more desirable than green or russet fruit, as they look better on the table. For such use the eye as well as the palate must be taken into consideration.

ARALIA MONSTROSA.—FIG. 264.

Marseillaise Figs.

I can corroborate what B. F. J. quotes from a French *savant*, on this fruit in the RURAL of July 24. I was at Marseilles in the summer of 1867, but as the soil around it is generally very barren, I do not recollect seeing fig trees growing in its immediate vicinity, though they probably may to some extent in gardens.

At Avignon, 50 miles or so up the Rhone, north of Marseilles, I plucked figs of fair quality from trees growing in quite a dry soil. I did not observe the character of this soil particularly, but it is my impression now that it was a light gravelly loam, and naturally rather poor. How much it had been fertilized artificially I cannot say.

No doubt by a proper choice of varieties, the growing of figs could be greatly extended in the United States; and this is a thing well worthy of more attention than has yet been given to it by our horticulturists. The best sorts are delicious, the poorest are little better than a green cucumber—that is, to my taste. Others, however, may differ with me as to this, for the old adage says: *De gustibus non est disputandum;* which is equivalent to the English "There is no disputing of tastes."

A. B. A.

The Vineyard.

NEW GRAPES AND OTHER FRUITS.

S. B. PECK.

THAT there have been great improvements made in fruits and vegetables during the past 50 years will be admitted by everyone who has paid any attention to the subject. Some of these improvements have been made by hybridization, a method requiring more science and care than most farmers and horticulturists possess; but many of them have occurred by natural cross-fertilization or evolution, requiring no more science than any farmer, man or boy, possesses.

The Concord grape, after deducting from its many superior qualities its lack of true vinous flavor and its too thin skin for keeping and rough handling, stands to-day, after many years' experiment, nearly, if not quite, at the head of American grapes. This, as I understand, was obtained by careful selection from the product of the seeds of native wild grapes. The Iona, standing nearly at the head of the list for flavor and for wine, is simply the second generation from the Catawba, and obtained by merely a selection from the products of the seeds of selected specimens.

On page 190 of the Report of the Mich. State Pom. Society for 1879, is an account by T. T. Lyon, President of said Society, of his reception from G. W. Fulkerson, of Ovid, Clinton county, of eight varieties of seedling grapes, selections from the products of the seeds of a single bunch of the Wilder—Rogers's hybrid No. 4; and Mr. Lyon says of them: "We were greatly surprised, not so much on account of the quality of the fruit, some of which we thought as good as, possibly even better than, the parent; but more especially from the circumstance that so many varieties of such high average quality should spring from a single bunch of any variety."

The writer of this article has been in the habit for the past few years (after lamenting that he did not begin 30 years earlier) of selecting, from the seedlings springing up in his garden, any vines that have shown marked peculiarities, and giving them cultivation; and though their products have always, so far as fully fruited, been worthless, there is one fruiting for the first time this year that shows remarkable progress in one direction, it has sixty clusters of blossoms on its ten feet of a single cane, most of them shouldered or forked. What will be the color or quality of the fruit is not yet shown, but its fecundity is certainly remarkable. I have two others not yet fruited that are remarkable in their nearly round, very dark-green leaves and dark-colored, hard, wiry canes. I speak of these, not so much as showing marks of improvement, but as interesting features in natural products, and as an encouragement to young people of both sexes, who have anything to do with the cultivation of the soil. Fortunes have been made by the production of new varieties of plants by the most simple processes open to all, and I promise with much confidence that fortunes are still in store for the persevering in horticultural experiments. Let not ninety-nine or nine hundred failures to one success discourage you. Select seeds from the best fruits; plant them in profusion; select the most promising plants and give them the best culture, in the best soil, and if, on fruiting, their product show any improvement, plant again from this improved product.

What I have said of grapes by the way o

encouragement to experimenters may, with equal propriety, be said of small fruits generally, and of peaches and plums, as well as of many vegetables.

The student of nature will find much to admire and to stimulate his curiosity in the natural productions of the peach from miscellaneous pits. Although a few varieties are almost sure to produce their kind, the majority will be a departure, each showing perhaps only a single feature from which to guess its parentage. A notorious idiosyncracy of this fruit is, that it will occasionally produce fruit with a smooth skin, the nectarine, from the regular peach pits. Nothing in horticulture is more curious and inexplicable, unless it be the sweet-and-sour apple, the actual existence of which can no longer be doubted, though proof is lamentably lacking that it has ever been produced, as has been claimed, by the union of two half buds that somebody once effected, but who, when and where, seems never to have been known.

Judging from the large amount of new varieties of the strawberry and raspberry that are yearly heralded, and their peculiar excellence lauded, I conclude that there is in these fruits a chance for the careful experimenter to obtain notoriety, if not a fortune, in the production of a new variety of strawberry that shall excell in all other respects the Wilson, a thing which I claim has not yet been accomplished.

Horticultural.

RURALISMS.

I HAD a talk with the editor of the RURAL a few days since about strawberries, during which he made the point that the word staminate, as often applied to strawberries, is wrong, and I agree with him. Years ago we had a long and lively war of words about pistillate and staminate strawberries, which did much good, though some of its lessons have been forgotten. Since then the words "perfect flower" have found a place in some catalogues very often, however, interchangeably with staminate, but more from force of habit than want of knowledge, I sometimes fall into this way myself. Why not begin now all round to use the proper words? Since I sometimes meet parties, even among strawberry growers, who do not know the difference between a pistillate and a perfect strawberry flower, a little explanation will not be out of place. For want of such knowledge strawberry beds have been made that proved to be quite barren. Naturally and botanically, the flower of the strawberry is perfect, having both stamens and pistils in the same flower. In cultivation we have varieties that bear imperfect flowers called pistillate because of the absence of stamens, and these kinds need the presence of perfect-flowered kinds to fertilize them; otherwise they will not bear fruit. A staminate flower is one that bears only stamens, and is consequently barren. Inasmuch as there is now no staminate variety in cultivation, the word should be dropped altogether, not only in print, but in conversation; a thing which some of us will find it hard to do. The pistillate varieties being marked with a P. in parenthesis, as is now done in some catalogues, it may be taken for granted that all others bear perfect flowers.

It may be of interest to note that the sexual character of the strawberry flower is sometimes modified in a marked degree by the weather. I have a number of times noticed in the Spring, when the weather is changeable and cold, that in some kinds the first flowers that open are destitute of stamens, and might easily be taken for pistillates. During the last Spring this was the case with even such kinds as Sharpless, Great American, Lincoln, and Duchess. These flowers produced no fruit. I say they were destitute of stamens; but the microscope revealed these organs in a rudimentary form, but there was no pollen. This will account for some early flowers not setting, and others producing very imperfect fruit. These cases must not be confounded with those where the stamens have been destroyed by frost. In the latter case the stamens turn black.

Nothing surprised me more during the past terrible drought than the wonderful display of wild roses. It seems to me that I have never seen it equaled. Week after week, fully exposed to the scorching sun, they lifted their harming pink flowers above the dry and brown grasses of the meadows, redeeming them, as it were, from the appearance of utter desolation. Not here and there a flower, but great masses of them, as if consulting together how they should restore the green carpet which so well befits their own modest beauty. And not only in the meadows, but along the roadside, and in many places even in the railroad cuts, masses of them bloomed profusely. Beautiful wild roses everywhere. Did it ever occur to the rose fancier that our wild rose would be an excellent subject to work with?

On page 492, the editor gives some pointed and deserved criticisms on "Pictured Exaggeration," which had also occurred to myself. These criticisms will receive additional point when it is known that some of the parties who indulge in these exaggerations ridicule without stint (and justly) the miserable French frauds who visit us almost every winter with crude drawings, representing gooseberries as big as goose eggs, pears of the size of marrow squashes, apples that emulate the dimensions of field pumpkins, bloated strawberries that grow on trees, and so on through a long list, with flowers to match or even excel them; and the truth compels me to say that hundreds are deceived by them. If so, how much more likely are they to be deceived by drawings executed in the most artistic manner? We want not only the size of the pictures reduced, but also the length and number of the adjectives in the descriptions that accompany them. I am convinced that both buyer and seller would be benefited by the change. HORTICOLA.

Sheep Husbandry.

SHEEP AND WOOL.

A. B. ALLEN.

BOTH of these are paying so well now, it is gratifying to observe the increased attention our farmers are giving to the improvement of the first for mutton, and of the second for the various requirements of the manufacturer, and especially in the finer grades.

The past year's clip of wool is estimated at 230,000,000 lbs, and yet it has not been found sufficient to supply our factories, and an additional 50,000,000 lbs have been imported for this purpose. Supposing our sheep averaged three and a half pounds of wool per head, it would require rather over 14,000,000 more of them to supply what we are now importing. But before these could be added to our flocks the rapid increase of population would give us many more persons to be fed and clothed than now. Meanwhile woolen fabrics will be rapidly on the increase in variety and quantity, so that it may be doubted whether our flocks could be brought up to meet all this within 20 years, however strenuous might be the exertions of sheep breeders to accomplish it.

The number of sheep now in the United States is estimated at 40,000,000. If these could be doubled, or even raised to 100,000,000 by the year 1,900, would they be too many to supply our wants? By that time our woolen fabrics will be so improved, that, as in the case of cotton fabrics, we may become large exporters, and if so, we shall then want a considerably larger proportion of wool to our population than is now required. We are also becoming greater consumers of mutton than formerly, and smaller eaters of pork; and this with the exportation of fat live sheep and their dressed carcasses, will also more than keep pace with their breeding.

An increased production of the finer qualities of wool is deserving of greater attention on the part of flock-masters among us. The Australians are proving themselves highly enterprising in this respect. From their recently improved combing wool, the French manufacturers fabricate those fine cashmeres and challis, which they readily sell as fast as made, at extravagant prices. From the Silesian and Eclectoral wools grown in various parts of Europe, shawls are manufactured in France and Austria, worth from $150 to $200 each. I presume this wool is of the same quality as, and no finer or more suitable for the above purpose than, that grown from the Silesian flocks kept for years past by Mr. Chamberlain of New York, Mr. Croskey of Ohio, and Mr. Cockerell of Tennessee. When I visited the late Mr. Chamberlain at his farm at Red Hook, on the Hudson River, some 25 years ago, he informed me that his Silesians were as hardy as Vermont Merinos, and they appeared to be so, and always subsequently when I have seen them. Messrs Croskey and Cockerell say the same of their flocks; and as they are thrifty animals of good size, and grow large fleeces, I can see no objection to the rapid increase of such among us, but very much in favor of it. There is no danger of a superabundance of this kind of wool being produced in America; and if it were ever to be the case, our European market is always ready to take it at a high price.

A World's Fair of sheep and wool is to come off at Philadelphia next September. We may expect great good from this, if the live animals and the fleeces of the best sorts of sheep are exhibited there from different quarters of the globe. It will then be well worth attending; and I hope as many of our flock masters as possible will make it a point to do so, and contribute liberally of their products. A comparison of such with others is the best method they can possibly adopt to ascertain what will be best for them to breed hereafter for the two purposes of wool and mutton.

Dairy Husbandry.

THE DAIRY COW.—No. 4.

HENRY STEWART.

How to Feed a Cow. 1.

THE best cow that could be selected will fail of satisfying her owner unless she is well fed. This term "well fed" should include not only a sufficiency of food but a selection of the best kinds. The choice of foods for cows is now so large that one must be troubled by the redundancy rather than by any difficulty in procuring the best food; and yet it may be necessary to be able to distinguish between the different kinds of food so as to arrive at a decision as regards the cost of feeding; for some of these foods cost much less than others in proportion to their feeding value. Grass and hay are the standard food of cows. A good cow will do her best upon the best of pasture; this being of mixed grasses, of which Kentucky Blue grass or common June grass forms the greater proportion. In estimating the theoretical values of foods the best quality of mixed meadow hay is taken as the standard and is rated as par, or 100, in the comparative lists frequently published. The following table of the theoretical comparative feeding values of the substances mentioned in an air-dry condition may be studied with advantage. The table gives the amounts of nutritious elements contained in each substance, with the crude fiber which is also nutritious to a small extent.

Feeding Stuffs.	Albuminoids.	Crude Fiber.	Carbo-hydrates.	Fat.
Coarse wheat bran	12.9	8.1	59.1	3.5
Wheat middlings	11.4	4.8	66.8	2.9
Rye Bran	12 6	2.5	67.0	2.2
Buckwheat bran	17.1	14.7	46.4	4.4
Pea-meal	23.7	4.5	54.5	3.5
Palm-nut cake	16.9	17.4	41.0	10 0
Corn starch meal	3.6	3.4	18.8	2.0
Brewers' grains	5.9	3.9	13.2	1.5
Malt sprouts	25.9	9.3	45.5	1.1
Linseed cake	32.4	7.3	31.5	11.6
Cotton-seed-meal	41.5	3.1	24.4	18.0
Hay.				
Timothy, headed out	8.4	28.9	44.4	1.7
Timothy, in full blossom	6.2	29.1	46.6	1.7
Timothy, nearly ripe	5.5	31.0	45.7	1.7
Red clover, before blossom	12.2	23.8	41.1	1.5
Red clover, full blossom	11.6	23.8	41.7	2.0
Red clover, out of blossom	11.3	25.6	41.0	1.6
Red clover, nearly ripe	8.9	27.2	24.0	2.0
Hungarian, headed out	10.7	28.9	34.8	2.0
Grains.				
Barley feed	12.7	7.0	63.5	3.2
Oats, white	11.5	12.2	57.8	5.1
Oats, mixed	8.0	12.9	48.0	4.7
Corn, (Eastern)	10.0	1.7	69.3	4.9
Corn, sweet	11.4	3.8	64.3	7.7
Corn, (Western) yellow	8.9	2.0	70.8	4.1
Corn, (Southern) white	9.7	1.8	70.4	4.1
Rye	11.0	3.5	67.4	2.0
Millet	12.7	9.5	57.5	3.3
Peas	22.4	6.4	52.5	2.0
Straw.				
Winter wheat	3.0	40.0	36.9	1.3
Winter rye	3.0	44.0	33.3	1.3
Barley	3.5	40.0	36 3	1.4
Oats	4.0	38.5	36.2	2.0
Fodder vetch	7.5	42.0	29.0	1.0
Pea straw	6.5	38.0	34.0	1.0
Bean straw	10.2	34.0	34.2	1.0
Seed-clover straw	9.4	42.0	25.0	2.0
Corn stalks	3.0	40.8	36.7	1.0
Corn cobs	1.4	37.2	42.6	1.4
Salt marsh hay	7.3	32.1	40.8	2.9
Rush salt grass	4.6	32.8	44.2	1.7
Coarse salt grass	5.3	30.6	38.3	2.4
Fresh marsh hay	9.6	32.8	39.3	2.1

But an article of food is practically valuable only to the extent to which it is digestible and of the above mentioned nutritive elements not all are capable of digestion. The actual digestible nutriments are given below, together with the relative money value and the comparative value, taking the best clover hay at one dollar per 100 pounds.

	Digestible nutriments.			Money Value.	
	Albuminoids.	Carbo-hydrates.	Fat.	Dollars per 100 pounds.	Compared with Meadow hay.
Wheat bran	10.0	48.5	3.1	1.01	1.58
Wheat middlings	8.9	54.8	2.6	1.00	1.56
Rye bran	10.6	50.0	2.3	1.00	1.56
Buckwheat bran	13.5	42.4	3.2	1.15	1.79
Pea meal	20.9	45.4	2.8	1.53	2.38
Palm-nut meal	16.1	55.4	9.5	1.61	2.51
Corn starch meal	3.2	19.3	1.8	0.39	0.60
Brewers' grains	4.8	11.2	1.2	0.36	0.56
Malt-sprouts	20.8	43.7	0.9	1.33	2.08
Linseed-cake	27.6	27.0	10.4	1.89	2.98
Cotton-seed meal	35.2	17.6	16.2	2.30	3.60
Timothy, headed	4.4	43.6	0.8	0.62	0.97
Timothy, full blossom	3.1	39.9	0.5	0.52	0.81
Timothy, ripe	2.7	40.2	0.5	0.50	0.78
Red clover, before blossom	6.7	35.8	0.8	0.67	1.05
Red clover, full blossom	5.9	38.5	0.9	0.64	1.00
Red clover, out of blossom	5.7	38.8	0.7	0.63	0.98
Red clover, ripe	4.0	39.2	0.9	0.56	0.87
Hungarian	6.0	38.3	0.7	0.64	1.00
Barley, feed	10.1	57.1	3.1	1.06	1.64
Oats, white	8.7	43.3	4.0	0.94	1.47
Oats, mixed	6.0	44.3	3.7	0.82	1.28
Corn, Eastern	8.4	65.8	3.7	1.09	1.67
Corn, sweet	9.6	61.8	5.9	1.19	1.86
Corn, Western	7.5	67.3	3.1	1.04	1.62
Corn, Southern	8.2	66.8	3.1	1.09	1.67
Rye	9.9	65.4	1.6	1.08	1.68
Millet	9.5	45.0	2.6	0.93	1.45
Peas	20.2	64.4	1.7	1.48	2.25
Wheat straw	0.8	35.4	0.4	0.37	0 57
Rye straw	0.8	36.5	0.4	0.35	0.55
Barley straw	1.3	40.6	0.5	0.44	0.68
Oat straw	1.4	40.1	0.6	0.45	0.69
Fodder-vetch	3.4	31.9	0.5	0.46	0.71
Pea-straw	2.9	33.4	0.5	0.44	0.69
Bean-straw	5.0	25.2	0.5	0.55	0.86
Seed-clover straw	4.2	28.5	1.0	0.49	0.76
Corn stalks	1.1	37.0	0.3	0.39	0.61
Corn cobs	0.6	41.7	0.4	0.41	0.64
Salt-marsh hay	3.7	38.7	0.9	0.54	0.84
Rush-salt grass	2.2	40.5	0.5	0.48	0.75
Coarse salt grass	2.5	30.3	0.7	0.47	0.74
Fresh-marsh hay	4.8	38.4	0.6	0.58	0.90

These tables, however, are only approximately correct, as will be obvious to one who is experienced in feeding cows; for instance, corn cobs are set down as being more valuable than corn stalks, and yet no one can be made to believe that as regards the actual feeding value of these two substances. Again, the condition of the substances exerts a large effect upon their nutritive value; for the best grown and cured stalks of the smaller and sweeter kinds of corn and the soft cobs of the green ears of sweet corn, are of far greater value than the stout stalks and dry, woody cobs of the Western and Southern Dent corn. The figures in the table are to be taken as a sort of guide-post, which points the way; and as by shutting the eyes one might miss his way when near his journey's end, although he had passed by many guide-posts on the road, so one who reads this table must, nevertheless, try for himself how near in practice its figures may come, and, after all, turn this way or that when he finds it necessary, to reach the ends he has in view. In several years' practice during which I have used more or less of all these feeding substances in producing milk and butter, I am inclined to agree very closely with the figures given in the last column, with the exception perhaps of the coarse fodders last mentioned. And yet upon one occasion, at least, in feeding fresh marsh hay to some cows, I found it to increase the milk considerably as compared with good Timothy hay; but the hay was grass and not sedges and chiefly that known as Blue-joint (Calamagrostis Canadensis) which is one of the most valued wild grasses of the Western States.

These values, then, being given, it only remains to choose from the list such as will be found the most convenient to grow, easy to procure or econonomical to purchase, and to combine them so as to make them the most effective in use. The practice of feeding is one of the most difficult in the business of dairying, and the enthusiastic owner of a newly acquired family cow may well be appalled at the view of all the figures above given, which are sufficient to stagger the majority of experienced dairymen. A few practical rules for feeding, then, may be given with the precise rations advisable to suit cows of different sizes and for the production of butter or of milk, not forgetting the effect of the different foods on the quality of the products; for this is of importance.

Industrial Societies.

EUROPEAN CORRESPONDENCE.

The Royal Agricultural Show at Carlisle.

CARLISLE, Cumberland, July 19, 1880.

"QUEEN'S weather" is a phrase indicative of fine, sunshiny days, and owes its origin to the excellent weather that has for years been common on occasions of public *fetes* or displays in which Her Majesty has taken part. "Royal Agricultural Society weather," or simply "Royal" weather, is soon likely to have a significance the reverse of this, if the shows of the "Royal" are held a few times more amid such a pluvial down-pour and such a sea of mud as have rendered this and the last exhibition at Kilburn a discomfort to the visitors, as well as a source of disease to some of the stock and of loss to the Society. By this time, however, the Royal should be accustomed to a debit balance at the close of its shows. Of the forty previous exhibitions money was lost by thirty-one, amounting in all to the sum of £73,093, equal to $353,770, while nine only left a credit balance aggregating £27,067, or $134,004, so that from its first show in 1839 down to this, the Society has been out of pocket by its exhibitions the net sum of £222,766, to which must be added a loss of at least $5,000 on account of the show just closed here. Although, doubtless, a balance on the right side of the account would be pleasant enough to the members at the close of their annual exhibitions, money-making is not at all the object of these shows, but rather the encouragement of all sorts of improvements in stock and agricultural utensils and products of all kinds. Accordingly the shows are held each year in a different part of the country, so that the farmers of all sections may in turn be stimulated and encouraged by the choice products brought together for their edification in their own neighborhood, and the awards of money and honor that crown success in every department.

Throughout England there are every year many county and district agricultural fairs, some of them of national importance, such, for instance, as the Bath and West of England show; but the agricultural show *par excellence* is that of the Royal Agricultural Society. What the Derby is to other races, this, wherever held, is to other shows, and the winner of a premium here partakes of the high honor that distinguishes the winner of "the blue ribbon of the turf" at Epsom. It is this consideration that attracts to these annual exhibitions the best of everything agricultural in the country, and often from abroad, that draws from all quarters visitors interested in agricultural affairs, and that renders an account of each show a matter of yearly interest to the farmers not of the British Isles alone, but of all progressive and especially of all English-

speaking countries, for, after all, there is no incentive to national amity and good-will so strong and lasting as an identity of language.

This old "border" town, which, in the days of English and Scotch warfare stood many a siege, was this year selected by the Society for its forty-first annual exhibition, which opened on Monday, July 12. From the first day to the last the weather was simply execrable—as bad as last year at Kilburn. Just as then, the misery started by dripping and pouring clouds overhead, was completed by deep, ubiquitous mud under foot—yes, and over foot. Planks had to be laid here, too, along the chief walks to enable visitors to get about with even a semblance of comfort. The northern folks are a sturdier race, however, than the Cocknies, and care less for rain and mud, so that, in spite of all discomforts, about 100,000 paying visitors inspected the exhibits during the week. This number is from twenty to sixty thousand less than that of the visitors to the four last shows of the Society; but these were held in much more thickly populated districts, and the weather was much more favorable at all except last year at Kilburn, and then of the 120,284 visitors, 67,000 were admitted during five additional days through which the show was extended; so that, in view of the wretched weather and the location of the exhibition, this fair was a success so far as visitors were concerned.

It was a success, too, in the number and excellence of the exhibits. Omitting last year's show at Kilburn, a suburb of London, for which special efforts were made on account of its Metropolitan character, the numbers of cattle shown here were fully an average as compared with the exhibits of the past seven years. Short-horns, of course, were far more numerous than any other breed. This is the case at all the local and national shows in England. Here there were just four times as many of them as of their rivals in beef—the Herefords; about nine times as many as of their rivals in milk—the Ayrshires; and more than three times as many as of the Jerseys. The multitude of this breed at every show is both a cause and an effect of their paramount popularity. The many prizes they win, owing to their intrinsic merits and their great numbers add to their reputation; which, in turn, increases the number of medium-quality Short-horns raised and of choice ones exhibited. The number of entries of all classes of each breed was as follows: Short-horns, 146; Polled Angus, 48; Jersey, 42; Polled Galloway, 38; Hereford, 37; Devons, 24; Polled Norfolk and Suffolk, 20; Sussex, 18; Long-horn, 18; Ayrshire, 15. In most cases all the entries were not filled; for instance, out of 146 entries of Short-horns, 133 only were exhibited; and out of 37 Hereford entries, only 33 were shown.

Horses.

The horse, the noblest animal on the farm and its motive power, comes first in the catalogues and in the admiration of the general public, and of horses the agricultural horse very properly takes precedence in an agricultural exhibition. Of this kind there were 279 entries, of which 107 were stallions of all kinds, 123 mares and fillies and 50 mares, colts, and geldings competing for special premiums. Agricultural, or cart, horses are here divided into three principal classes—Shire horses, Suffolks and Clydesdales, each of which breeds has its special admirers, and is also excellently adapted to certain conditions. The short-legged, active and hardy Clydesdale is well suited to a rough, uneven country and a severe climate; and hence is a favorite among the Canadians on your side of the water; the ponderous Shire-bred is justly a favorite on level country roads and city streets; while the short, thickset, clean-legged Suffolk will prove more satisfactory than either in a clayey country where the adhesive mud would soon clog and weigh down the tufted legs of his rivals.

Here as in nearly every department in these exhibitions, it is noticeable that some exhibitors take the lion's share of the premiums in certain classes year after year and at county, district and "Royal" show after show. They are always wealthy and generally titled men who, for honor or profit, pay special attention to the breeding and purchase of the best of their kind in one or more particular lines of farm animals. Having ample means to secure the best of the best breeds and the most skillful help to manage their stock, they have so great an advantage over ordinary, well-to-do stock-owners, that the latter are seldom willing to incur the trouble and outlay necessary to prepare an animal for exhibition, for it takes a couple of years of careful handling to fit, say, a Short-horn for the show, and even should it win a premium, the chief reward would lie in the reputation thereby gained for the owner's herd.

A visitor to the different fairs, too, will be sure, year after year, to see the same prize-winners at all the principal shows, the veterans at the head of each class occasionally changing places with each other, according to slight changes in their respective conditions, or, more commonly, according to the whims or prejudices of the judges; but in nearly all cases shutting out from the premium list all not belonging to their artistocratic clique. These usually begin by appearing at the different exhibitions in the youngest class, advancing each successive year to an older one, until they have become "adult," after which they appear until age or death puts an end to their victorious careers. Of course, there are many advantages in such a practice, especially to the owners of the successful animals, but it strikes me forcibly there are some disadvantages, especially in a little country like this, within whose narrow borders the necessarily frequent sight of the same prize animals must become a trifle monotonous and uninstructive to the visitor. It adds to the evil, too, that the animals are never weighed; so that the eye aided by the memory is the only judge of any changes in their conditions from one exhibition to another.

As an illustration of the above remarks the Earl of Ellesmere, of Worsley Hall, near Manchester, took all but one of the first premiums for Shire horses, besides three second and one third premium in the same department. In pigs also he carried off four first and three second premiums for the large White breed, three first and one second for the Small White breed and three first for other breeds. His Short-horn, Attractive Lord, too, was considered by many a better beast than the first and second adult prize-winners, but had to be content with the third premium. On the whole, the display of these horses was excellent, that of Shire horses being the largest and finest and that of Clydesdales being the least excellent. The premiums for horses agggregated $10,285. —To be continued.

Entomological.

OUR ENEMIES, THE INSECTS, AND THEIR CONTROL.—No. I.

It is becoming more apparent each year that agriculture is seriously threatened by the great increase of its insect enemies. The States and general government appoint and set on foot costly inquiries. All the ingenuity of man is exhausted in mechanical inventions and poisonous destructives, yet it is but too apparent that, notwithstanding all our efforts, noxious insects are on the increase, and the present methods of destroying them by hand-picking and mechanical means, as well as by vegetable or mineral poisons, are alike inadequate. Our feathered friends, the birds have been so reduced in numbers that Nature's balance of power is also destroyed, and a like condition is found with reference to beneficial insects. There are no statistics sufficiently full and accurate to enable us satisfactorily to estimate the amount of injury done to our crops by these pests every year. It clearly may be counted by millions for New York State alone. The sums to be added for the nation at large, and for all the other nations of the world are simply beyond computation.

This is the condition in ordinary years; in exceptional ones as when Caloptenus spretus, the hateful locusts, or Blissus leucopterus, the chinch-bug, prevails, the calamity becomes painful to contemplate. People of all nations, civilized and savage, at present and in past ages have felt and been forced to suffer hunger and starvation from calamities caused by insects. The common farmer and the scientific agriculturist have alike studied the problem without finding adequate relief, but at length it is thought there is a glimpse of hope.

The word entophytes is employed to denote those parasitic plants which grow in or upon living insects and animals. The term is not confined to a particular class, some entophytes being algæ, others fungi; they belong to the lower sections of the orders of Cryptogamia. Many of them are common to both plants and animals. It is through the use of the spores of these parasitic plants found naturally or germinated artificially, and employed as infectious or poisous to insects that relief may finally come to our imperiled agriculture.

This subject has been so little investigated that scarcely any definite and precise information is attainable, and what inquiry has been made, has mainly been confined to scientific men for scientific purposes. The subject needs, in part, to be taken out of the hands of scientists as a purely learned inquiry, and to be popularized or, as much as possible, divested of its technicalites and taken up by agriculturists for practical and economic advancement. Ever since Pasteur studied the silk-worm diseases of southern Europe, and proved that the disease was caused by Botrytis bassiana, an entophyte (or mold), sporadic in its origin, it has been dimly apparent that here was possibly a factor that, if rightly employed, might solve the problem of controlling insect ravages. This silk-worm disease has never been subdued, and the utmost precautionary or sanitary measures have still to be maintained throughout the silk districts of France and Italy. Healthy, uncontaminated eggs from California and Japan have to be annually imported at great expense, in order to maintain the present status. The parasite appears, and on microscopic examination, can be even seen in the eggs laid by the affected insects.

Herein is where hope is apparent for agriculture. If the parents can be poisoned so that they cannot lay sound, healthy eggs, and if the poison continue effective through the larva and pupa stages, and is again developed in the mature insect, finally causing death and entailing such conditions upon all descendants, the ultimate solving of the whole problem may, perhaps, be confined to finding out, first, the parasites that are destructive to each particular group of insects; second, the means of obtaining or of artificially propagating the spores, and, third, their proper employment in the work of destruction.

The spores of the common yeast plant, and a number of others have been employed for this purpose with some apparent success, and a number of other varieties have been suggested; but it will, doubtless, be found that a single one or a single class will not answer for all insects, and that inquiry must be made among the various classes and orders of Cryptogamia, for those appropriate to different insects. Insects of different classes and orders have often been observed to become the prey of fungi, but the subject is too voluminous to be entered upon here. It will be sufficient, at this time, to state that insects are often destroyed in large quantities in some mysterious manner by natural causes, and the probabilities are that entophytes in some of their occult or unstudied forms, are usually the means or cause of destruction. D. S. Marvin.

The Poultry Yard.

ARTIFICIAL INCUBATION.

HENRY HALES.

Sometime ago, I promised the Rural readers that I would give some attention practically to hatching by artificial incubation, and report my experience through your columns. In keeping this promise I lay myself open to criticism by those whose experiences have been different from my own. As this subject is now receiving much attention, those who report a great success are likely to be applauded as sharp, clever men. Now, I do not claim this, and, dull as I may be, I will give you the honest result of my observations. I started by examining the merits of many different machines, all claiming to be perfect, and selected the one that appeared to have all the requisites and little or no complicated arrangements, and which was sold at a reasonable price. I hear some one say I bought too cheap a machine. Well, I found one that was brought out last Spring for $25. I procured it early in March. I thought the cellar under the house, being light and dry, would be a good place for it, and I have often heard such a place mentioned as being a good one for an incubator. In this I was much disappointed. I found the temperature too much disturbed by the violent changes of the weather outside at that time of year; later in the season it would be better. The temperature of my machine was too irregular; the cellar was subject to a change of from 15 to 20 degrees in a few hours, so my first batch of one hundred eggs was nearly all spoiled. I believe it imperative during such seasons to have an incubator in a place where at least a little of the effect of fire is felt, to moderate the severity of such changes. I did not wait more than five or six days before I learned how my eggs were going on, for with an egg-tester one can see plainly by that time which are good.

As soon as I found my mistake I shifted the machine to a second-story landing, where the temperature was about as even as could be desired. Another batch of eggs was deposited and this time most of them started right. The thermometer kept very regular and everything looked prosperous. In about two weeks many eggs became rotten; they appeared to dry up too much in the shell, as the air bubble got much too large. This could hardly come from too dry an atmosphere, as a large pan of wet sand was kept constantly under the egg-drawer, the bottom of which was of drugget. I thought, perhaps a very light sprinkle of hay for the eggs to lie on might be better, but did not find it so after a trial. The temperature of the egg drawer was kept at about 100 degrees. I sometimes sprinkled the eggs with tepid water, yet they wasted away too much in the shell. The result was that a few weakly chicks and ducks hatched, but many more could not break the walls of their little prisons.

In assisting the little creatures to freedom, I found the shells of the hatching chicks in a condition entirely different from that of an egg hatching under a hen; that from the incubator was as hard as a newly-laid egg, while that from under a hen was quite soft and easily broken, having a rotten appearance, as it yielded quite easily to the pressure of the young chick. I think much more has to be learned in this direction, as so many chicks are not able to get out of their shells in incubators. It has been generally supposed that this occurred because the chicks are weak; is it not that the shells are strong? Perhaps the natural perspiration of the hen rots the shell to such an extent that it may be easily broken by the delicate chick. I tried slightly greasing the shells of some with lard when I put them into the incubator, but I did not find that this gave any help.

I tried a third batch of eggs with no better result. My eggs were all from my own yards, of eight varieties of fowls and two of ducks. Precisely the same kind of eggs hatched well, at the same time, under hens. What confirms my theory about hard shells is that I found that the eggs of Plymouth Rocks, which have harder shells for their size than the eggs of most other fowls, were hatched more tardily than those of White Leghorns and other thinner-shelled eggs.

I have made inquiries of others who tried incubators this Spring, and find opinions vary very much concerning them; many were more successful; some were successful with one batch and afterwards failed; others had no better luck than myself. Altogether, I did not consider my experiment a success. I did better with the poor old biddy, and with all her faults I love her still. [We should be pleased also to publish the experiences of other readers with incubators.—Eds.]

Industrial Implements.

Messrs. J. A. Field, Son & Co., of St. Louis, Missouri, have made a valuable improvement in their Star three-roll cane mill. The scraper in all this style of mills has heretofore collected more or less of the finer portions of the crushed stalks which have to stay there over night—or until the mill is used again. This matter, if the weather is warm or murky, ferments, and many a batch of sirup, the first in the morning, has been spoiled by this, when the maker has not known the cause of it. The improvement consists of a simple arrangement by which the scraper can be removed and the mill washed out in two minutes perfectly clean.

Miscellaneous.

London-purple.—A correspondent writes us:—"By the way, I have just make a trial with London-purple on my potatoes. I am sorry I had so much faith in it; my neighbors have proceeded with more caution. I mixed one ounce of the purple with three gallons of water, and sprinkled about half of my patch. The only effect that I could see was that it killed all the potatoes that I put it on, and all the inconvenience it gave the bugs was that they had to foot it to the other potatoes, and there was not a bug that even walked lame. The merchant wishes to find somebody that wants a house painted purple." [We have used London-purple on several acres of beetle-infested potatoes with results entirely satisfactory, and have received equally favorable accounts from other quarters.—Eds.

Certain Death to the Potato Beetle. —A Canadian genius hailing from lively Toronto, sends us the following very effective though perhaps a trifle slow mode of exterminating the Doryphera decem-lineata:—"Take two blocks of wood, two inches square; pick up the bug and lay it on block No. 1; lay block No. 2 on block No. 1, so that the bug rests between the two; then sharply press the blocks together, and that bug will never trouble potato vine more. Repeat the operation with other bugs until the potato patch has been thoroughly rid of the pests." The remedy is certainly more effective than a number of those we have seen recommended, and almost as practicable.

WHAT OTHERS SAY.

We find the following in the London Mark Lane Express: "A certain agricultural institution—it would be cruel to mention its name—has recently added another feather to its already weighty plume. A short time ago one of the members of the staff, finding there were certain plants absent from the botanic garden, sent a long list of plants to one of the leading botanic gardens in this country, and asked for specimens on the ground that they could not be obtained in the neighborhood, nor yet from the nurserymen and florists. In this list of plants occurred, amongst others: 1, Secale cereale; 2, Triticum repens; 3, Phalaris Canariensis. The people at the botanic garden are immensely tickled at this, inasmuch as No. 1 is the common rye of which any farmer would have given the professor a few grains; No. 2 is the troublesome Couch-grass, which the farmers have had in far too great a quantity during the past Spring; and No. 3 is the Canary grass which may be easily grown from the canary seed with which we feed our feathered pets."

FRENCH PRIZE ROSES.—L'Illustration Horticole has the following: The Journal of Roses, published in France and devoted exclusively to roses, has had the happy idea of organizing a sort of plebiscite to obtain opinions as to the best roses. Eighty-five lists were sent in, and from these was made out the following list of fifty having the most votes:

La France	79
Baronne Adolph de Rothschild	76
Paul Neron	76
Gloire de Dijon	72
Souvenir de la Malmaison	72
Jules Margottin	70
Marechal Niel	70
Baronne Prevost	67
Gen. Jacqueminot	52
Captain Christy	50
Belle Lyonnaise	47
Eugene Appert	47
Louis Van Houtte	47
Anna de Diesbach	47
Aimee Vibert	44
Souvenir de la Reine d'Angleterre	43
Charles Margottin	42
La Reine	42
Victor Verdier	42
Charles Lefevre	41
Comtesse d'Oxford	39
Madame Boll	39
Gloire de Ducher	36
Madame Falcot	36
John Hopper	35
Madame Lacharme	34
Cecile de Chabrillant	33
Louise Odier	33
Marquise de Castellane	33
Celine Forestier	32
Elizabeth Vigneron	32
Boule de Neige	31
Madame Victor Verdier	30
Therese Level	30
Geant de Battailles	29
Rose du Roi	29
Triomphe de L'Exposition	28
Elise Boelle	27
Lord Raglan	27
Camille Bernardin	26
Duchesse de Cambaceres	26
Lamarque	26
Marie Van Houtte	25
M. Boncenne	25
Ophirie	25
Alfred Colomb	24
Empereur du Maroc	23
Jean Pernet	23
Madame Scipion Cochet	22
Chromatella	22

The figures show the number of votes given to each.

THE CRANBERRY.—Here is an interesting little item from the American Garden, respecting the cranberry: It is most profitably cultivated on low, moist, level lands, where drainage as well as overflowing can be applied, as circumstances may require. Yet, like many other plants, it may be grown successfully under conditions very different from those in which it is found in its wild state. Any loamy, naturally moist garden soil will grow cranberries. The plants are set out and cultivated exactly like strawberries, until the vines have covered the entire ground, when no other care is necessary than to pull out the tall weeds. An occasional light dressing of fine swamp muck or sawdust is very beneficial and keeps the ground moist. A small beginning in cranberry culture may even be made in a flower pot. Plants grown in this way are not only highly ornamental, the fruit hanging on the vines until the blossoms appear for the next crop, but also astonishingly productive.

THE editor of the Cultivator and Country Gentleman has visited the grounds of E. P. Roe He says, in the course of his remarks respecting his visit, that Mr. Roe plants his trial grounds with all the varieties in ordinary cultivation as well as the new aspirants for public favor.— — — The new red raspberry, the Cuthbert, is evidently the best on his grounds, taking vigor of growth, hardiness of plant and yield of fruit into consideration. It apparently is as good on rocky, slaty soils as on the deeper alluvium of the valleys. The canes are strong, foliage dark, profuse and healthy, and the fruit grows in large bunches, ripening well together on the same bunch, but as some canes are always later in ripening than others, the season is sufficiently prolonged. The fruit is of good quality, not so fine as Brinckle's Orange or similar tender sorts, but still good enough for the general taste. The fruit grows larger than most other sorts, on a hot, dry soil, but, of course, is much larger, and the crop is larger on rich, deep soils. It proves, even on the north side of a cold, high, rocky mountain (where Mr. Roe's farm lies), exceedingly hardy, never winter-killing in any exposure. Its vigor of growth is such that it can be distinguished at a distance from Brandywine, Herstine and other vigorous sorts. The berry is sufficiently firm to endure carriage well. The new sort called Queen of the Market seems to be identical with the Cuthbert.

Mr. BENSON tells the N. Y. Tribune that in September, 1878, he put a small trout in his well, which is 26 feet deep and covered at the top with plank so that but little light could gain admittance. Late in the Autumn of the year he cleaned the well and found his troutship apparently enjoying good health and fully a third larger than when he was put in. A short time ago, after the lapse of nearly two years he cleaned the well again and, contrary to his expectations, the trout was there and grown to quite respectable dimensions. Had not the water been exceptionally pure he would no doubt have perished in a short time.

GAS COAL-TAR INSTEAD OF PARIS-GREEN.—A correspondent in the Western Rural makes the following statement: "We are using successfully in this locality gas coal-tar, and find it more simple, safer and cheaper than Paris-green. It is prepared as follows: Put four or five gallons of gas coal tar in a barrel; fill up half full with water, and stir well, so the water will become impregnated with the tar; after the tar has separated from the water sprinkle the latter on your potatoes, cucumbers, rose bushes, cabbages, etc. Care must be taken that the water is not too strong. This has been tried by a gentleman in this city for four consecutive years, and he cares nothing for the insects so far as his garden goes. For the worms that infest fruit trees, a smoke from the burning tar is a "dead-sure" remedy; every worm or insect will immediately drop from the tree, choked and lifeless, and no injury whatever will be had to the foliage, as by sulphur."

RAISING POTATOES.—From the Elmira Farmers' Club as reported in the Husbandman, we take the following:—

J. R. Conklin.—We do not raise as big crops of potatoes as in former years, but I think none of us knows why. I plant the stem ends because the seed ends give too many sprouts.

D. T. Billings.—Will they give any more than the whole potato, and will a whole potato give more than a piece—say one-quarter?

J. R. Conklin.—I think it will, but of that I am not sure. It seems safe to assume that the more eyes there are in the hill the more sprouts will grow.

G. S. McCann.—I have planted whole potatoes, large and small, and pieces cut to halves, quarters and smaller, even to single eyes. As a rule the best and largest yield will be had when the largest, smoothest and best potatoes are planted whole. This will not hold good every year, but it will in average seasons. Last year, some rows in my potato field planted with large whole potatoes had so much larger tops than other rows alongside planted with cut seed, that the difference could be seen a long distance away, and the crop was as much better as the appearance of the tops.

President McCann.—Why plant large, whole potatoes if they send up no more shoots?

G. S. McCann.—Because they furnish support for the shoots until they have become vigorous and strong.

W. A. Ward.—A piece with two or more eyes may give as many, and as strong shoots, as a whole potato; but the piece will probably not prove as safe a dependence in ordinary planting from year to year. If I were going to settle upon a safe rule for field planting I should select fair, smooth potatoes of good table size, and would put one whole potato in each hill. There can be no safer way, although the requirement for seed would be greater, perhaps, than where cut pieces are used.

CABBAGE TEST-PAPER.—A useful test-paper may be made by boiling a pound of the leaves of red cabbage in one pint of water for some time, and then straining the blue liquor through muslin. Evaporate to about half its bulk; place layers of white blotting-paper in the liquid, and then hang them up to dry. Acids change the blue color of the paper to red, and alkalies turn it green. This is a very good substitute for litmus paper.—Journal of Chemistry.

APIARIANS, it appears from the London Farmer, are so numerous in Paris as to become a nuisance to their co-citizens. One inhabitant alone in the 19th Arrondissement keeps from 800 to 900 hives; and there are great numbers to be found in the 13th Arrondissement, near the goods station at Ivry. Valuable as are the bees to their owners, they do a great deal of damage in various directions. At the Say sugar refinery, for instance, it is calculated that the damage amounts to 25,000 francs a year; for a whole jarful of sirup will be completely emptied in less than a couple of hours, and two or three bushels of bees are taken or destroyed within the day. The workmen, who are obliged to follow their occupation bare to the waist, suffer terribly from these little pests, and frequently get badly stung. The busy bee improves the shining hour to the serious disadvantage of many peacefully employed Parisians.

Everywhere.

RURAL SPECIAL REPORTS.

GA., Washington, Wilks Co., July 31.—Our wheat and oat crops have been thrashed out. Oats have turned out well—that is, the red rust-proof variety. All other sorts rusted and their yield is poor. Wheat, too, has given a very poor yield. The corn and cotton crops now need rain. Upland corn has been damaged badly by drought. Cotton is good where it has been well and properly cultivated. The fruit crop is almost a failure in this section—what the late frosts left has been damaged by insects. About all our garden crops have been ruined by dry weather. J. C. D.

ILLINOIS, Baldwin, Randolph Co., Aug. 1.—In all low or improperly drained lands, the wheat was badly winter-killed. It also failed to tiller out as much as it did the year before, and the general opinion was that the crop would fall short considerably from that of the previous year, and so it looked until harvest. Up to then we had a rather wet Spring, and after wheat was harvested we had a week of heavy showers which damaged the crop considerably in the field before it was stacked. Still, as the thrashing proceeds, the crop is turning out well, and, putting in the increased acreage, will nearly, if not quite, equal last year's remarkable crop. With oats the prospects at the time of wheat harvest were splendid; they were thick on the ground, high enough and headed out first-rate; but for some reason they failed to fill and the yield will fall far short of what was expected. The continued showers had made corn grow and tassel out well; but two weeks of hot, dry weather have dried it up, until now, unless we have rain very soon, there will not be half a crop. Even with rain now it must be damaged considerably. We are never certain what the crop will be until it is gathered in the granary; a few days of unusual wet or dry weather may cause a loss of nearly half a crop. Sometimes, early-sown wheat is the best, and perhaps next year the late-sown will be ahead. N. J. S.

IND., Columbia City, Whitely Co., July 31.—Wheat is two-thirds of a crop; oats a full crop; rye and barley are not much raised. Fultz wheat is the main variety. Sorghum is not much grown. Corn is light owing to so much cold weather. Potatoes are not very good. Fruit is about half a crop. Early cherries are plentiful but there are not many late ones. W. S.

IOWA., Vail, Crawford Co., July 31.—The weather is delightful. Farmers are busy harvesting their grain. Wheat will average about 15 bushels per acre and is of good quality. Oats, a fair crop. Garden vegetables are abundant. Fruit a fair crop, but owing to the newness of our country, fruit is not as plentiful as it will be in a short time. Corn looking well, and an excellent yield is anticipated. M. E. G.

KANSAS, Burlington, Coffey Co., July 26.—Fall-sown wheat is a good crop and harvested in fine condition. There were in this county 8,078 acres of the Fultz, Walker, Cottingham, Little May and Odessa. The Fultz takes the lead and so far has given good satisfaction in all parts of the county. The Walker has its admirers also, who claim that it is ahead of the Fultz. The Little May appears to be running out and the Odessa has not come in yet to any great extent. Estimated average for the county, 23 bushels per acre. Of Spring wheat there were 69 acres; it is not a paying crop. Of barley there were only 10 acres; it does not succeed here. Rye does well here and is sown chiefly for late Fall and early Spring pasture for cattle, and after being thus eaten down it yields from 15 to 25 bushels per acre. There were 420 acres sown. Oats is good, taking the county through; but the absence of rain in some parts of the county in the early part of May caused them to be light there; but they are extra-good in those parts more favored with early rains. Again, some farmers did not get their oats in early enough, and in those cases there is a slight falling off. Oats to do well here, must be got in early—very early—not later than February if it can be done. There were 4,083 acres sown: estimated average yield, 35 bushels per acre. Corn is the king crop this year, and from present appearances it seems likely to outdo all previous yields. There are 42,120 acres planted, and the estimated average yield is 60 bushels per acre. The principal varieties grown here are the large and small Dent, and a striped or Calico corn, an extra-large kind, yielding enormously on the bottoms. It is known pretty much by the name of Bloody Butcher. Of buckwheat there were 79 acres in the county. It is not reliable, our Falls being a little too dry to make a paying crop. Still, some people plant it every year for home use, and they have always got some. Of potatoes there are 774 acres and they promise a crop far better than any raised here for years. The principal varieties are the Red and White Peachblow and the Snowflake for Winter; and the Early Rose, Early Vermont and Snowflake for early. Sweet potatoes look well; there are 41 acres under them and they do well. Sorghum, too, thrives here, but it is cultivated only for home use. The Minnesota Early Amber is the leading variety. There are 287 acres in this season. Of apples there will be over half a crop, and the following sorts do well and are esteemed about in the order named: For Summer:—Red June, Sweet Bough, White June, and American Summer Pearmain. For Fall:—Fall Pippin, Rambo, Striped Sweet Pippin, Fall Wine, Maiden's Blush, White Bellflower, Fulton Strawberry, and Grimes's Golden Pippin. For Winter:—Rawle's Jeniton, Missouri Pippin, Winesap, Ben Davis, White Winter Pearmain, Milam, Limber Twig, Stark, Smith's Cider, McAfee's Nonsuch, Sweet Romanite and Golden Russet. There are a great many others that do well in most seasons; but the above-named have given general satisfaction in all situations. There are also some good apples that have given the best satisfaction, but the owners do not know their names, nor does any one around here. The trees are hardy and very productive of fruit of good size and quality. This year they are well laden with fruit, and a great point in their favor is that the fruit does not drop till fully ripe. Pears are not successful in all parts, though in some locations they do well and the owners would not part with them on any account. Most of the leading varieties are being tested in nearly all parts of the county, but as yet not much can be said about them further than that some of them have winter-killed already, mostly on the bottoms; yet in other parts, especially on the uplands, they are growing finely. Of cherries, the Early Richmond is the only one worth cultivating; this does well. The only plums worth planting are the Wild-Goose, Sand and some native wild plums. The Damson does well in places, but, as a rule, the curculio gets away with them too much to make them profitable for general cultivation. Of grapes there will be a very full crop; the vines are fairly loaded down with fruit: many kinds do well here; but the following prove reliable:—Concord, Dracut-Amber, Martha, Delaware and Hartford Prolific. Peaches are only partially successful. Many were winter-killed last Winter. There will be over half a crop this season. The seedlings appear to do the best. Hale's Early and Crawford's Early do well also. Gooseberries were a full crop, they do pretty well and bear in abundance, but the fruit is rather small. Houghton's Seedling is the principal variety. Currants are not successful here. Some are being tried on the north sides of houses and tight fences, but with what success has not yet been determined. Strawberries are not to be relied on. Some seasons they do well; but, as a rule, the season is too dry to make them a paying crop. Blackberries and dewberries do finely and this season there will be extra-full crops. The Kittatinny is the principal kind cultivated. Raspberries do well in some parts; but are liable to be winter-killed. A. G.

MICH., Watson, Allegan County, July 26.—From about the 12th of May to the 4th of July, we had such incessant rains that the streams were all full, and land so soft, especially clay or loam, that we could make but little headway with farm work. Since the 4th, we have had splendid weather for haying and harvest, and it has been well improved. Wheat at this date has been all secured; and the hum of the thrashing machine is heard in every direction. Where thrashing has been done, the yield was good, both in quality and quantity. The Clawson is the most popular variety, as it will flourish on all soils. I had a piece of about thirteen acres on a loamy soil which had been lately cleared, and could be only imperfectly drained, on which during the late rainy weather the water stood around the roots the greater part of the time, and it came out all right. The harvesters had to wear rubber boots while cutting it; and when it was stacked the ground was so soft that one-fourth of a load was all the team could draw. It was cut during the week ending July 10th and stacked during the week ending July 17th. Now the same ground is as dry as any one could wish, and we feel a little as the Englishman did after such a protracted wet spell, when one day the sun came out and he laughingly remarked, that "God was going to smile on us once more." Haying is very nearly done, and all cut since the Fourth has been put up in good order. Some of that cut in June will be worthless. Potatoes on upland will be good; they are worth now 50c. a bushel in market. The Colorado beetle has troubled them this year but little. I attribute it to the protracted wet weather, I think the eggs need sun to hatch them. There has been and is now an abundance of all kinds of fruit, and it has been very healthy. New wheat started at 80c. per bushel. If this pleasant weather continues, corn where the land was not so low that it was drowned out in May and June, will be a good crop. As a consequence of the wet weather most of the pieces are grassy, but a week or two of thorough cultivation now will remedy that. Butter is extremely low—only from seven to ten cents per pound, and the yield thus far very moderate, for during the wet weather there was but little substance in the grass, although its growth was large, so that we predict a better market this Fall. Cheese factories are also running, but that product is also low, so that the furore for keeping cows has abated from what it was four or five years ago. H. D. E.

MICH., Big Rapids, Mecosta Co., July 27.—Wheat on heavy soils was badly winter-killed, and on lighter soils, where in the Spring it promised to be a heavy crop, at harvest time it proved to be very deficient. The crop, however, will be an average one. The weather for the past two weeks has been unfavorable—rain every day, with the exception of the 23d and 24th, during which days the greater part of the crop was secured, though I fear some of it was put up in bad condition. Hay, oats,

rye, and potatoes are good. Very little barley is grown here. This is comparatively a new country, especially for cultivated fruits; but wherever there are orchards old enough to bear they are heavily loaded. I have an orchard of about 500 trees—apples, pears, plums, and cherries—and nearly all are loaded with fruit. Wild fruits, such as blackberries, raspberries, and whortleberries, are in great abundance. W. C.

Mo., Springfield, Greene Co., Aug. 1.—For some weeks just ended Greene Co. has had it warm and dry. Our farmers worked right on thrashing, haying, etc.; but were getting a little apprehensive for the corn crop. All is right now, however; it has rained finely and still rains with a fair prospect of more. Already the land is pretty thoroughly wet, making a sure thing of a good corn crop. Farmers are now happily furnished a good season for turning over the land for wheat, sowing grass, turnip seed, etc. It is a good time, too, for setting new strawberry beds. We shall now have fine pasture till Winter. Sheep, cattle and other stock are quite healthy here. Large numbers of cattle have died recently in Jasper and Boston counties, 60 to 75 miles west of us, their deaths being due, it is said, to "Texas fever." It is said 400 head died on one farm. The disease, like "hog cholera," is unmanageable and incomprehensible. JOT.

N. C., Park Hill, Burke Co., July 31.—The Ennobled oats are conceded by all who have seen them to be superior to any in this section. The harvest is about over. Fall wheat will yield from 25 to 35 bushels per acre—Clawson and Scott being the principal varieties sown. Hay is an average crop. Oats are rather above an average. Of peas none are sown on account of the bug. Roots good. Fruit much scarcer than last year. R. J. K.

N. Y., Hornellsville, Steuben Co., July 28.—At present the prospects for us in this and ten or twelve or more surrounding towns, in Steuben, Alleghany and Livingston counties, are not quite so encouraging as at my last report about June 24, and some modifications are necessary. Since that time we have had but slight showers and are now suffering I think from the worst drought in the growing season for many years. Winter wheat has been good and was gathered in fine condition. Hay is nearly all in, and is of good quality and in fine condition, but light. Spring wheat is very light, hardly an average piece is to be seen. Barley is fair to good. Oats are a fair crop—straw short, but heading out well and beginning to turn while a few early fields are cut. Potatoes must be a light crop; early ones are now being dug for market being probably the largest we shall have. Corn is suffering badly from the dry weather; the leaves are rolling up in the day time and there is not dew enough to cause them to unroll during the night. Fodder corn could not make a growth. Hungarian grass, when sowed to eke out a scanty hay crop, utterly refuses to come forth, and buckwheat when it has started commences to blossom when only three or four inches high. Apples are dropping to a great extent and this will materially lessen the expected crop. Meadows, when cut, have mostly turned brown; pastures are drying up badly and it is reported in many instances dairymen are feeding hay. Water grist-mills are much troubled, for the "sound of the grinding is low" and we are passing through a first-class drought with streams, wells, springs, and cisterns in perfect sympathy. For many days we have been looking to the south and west for the "winds likely to bring rain," but so far see nothing but billowy clouds like huge dry sponges rolling over our heads after all their moisture has been squeezed out over the prairies of the West. Even the moon has gone back on us—one hundred miles east she has given her votaries a firmer faith than ever in her influence, and to those one or two hundred miles in our rear she has, according to her "signs and changes," proved to be a true prophetess, but to us, alas! only a gay deceiver. But somebody, I think it is the pitiless Daily Tribune, says, "It has been part of the farmer's nature to grumble and to predict ruin to himself ever since the days of Cain, *who was the first of them all.*" Now, as a farmer, I don't want to hit back, but we have it on good authority that the Devil had a good deal to do with the first pair of farmers in the Garden of Eden and that he has kept it up ever since, and if he was the means of bringing more upon poor Cain and his descendants than they could well bear without grumbling, the reproof surely should not come from a printing-office, where of all places, we know he is perfectly at home and a not unimportant adjunct. But let that go—as farmers we will not be ruined this year. Wheat is good; hay, oats and barley, fair; fruits enough and some to spare; plenty of everything to eat; plenty of work for those who wish to work at good wages; good prices for all that a farmer can raise, and this brings money to pay his work hands, with a general contented feeling among laboring classes; still why may not a farmer speak of facts and not be termed a grumbler, when he fodders his cows in July, drives them half a mile to water, with a poor prospect of buckwheat and Johnny cakes of his own raising, and is pretty certain of having to eat small potatoes for the rest of the year! C. J. P.

N. Y., Madison Co., July 30.—We had a severe drought here in May and June, so the hay crop will be 50 per cent short. Spring grain is looking well. Corn is looking fine; if nothing happens to it there will be a large yield. We shall need all the coarse fodder to keep our dairies through the Winter. Potatoes are going to be a large yield, if they don't rot. Apples promise a fine crop. Some Winter wheat is raised here, and it is all harvested: very nice but not a very heavy yield. The great pests here now are the grasshoppers; they are eating almost as much as our cattle and are stripping our oats and buckwheat clean. My Ennobled oats are looking fine and my cow-peas are growing very nicely. The beet seeds from the RURAL all came up nicely and they are growing very fast. The tops are enormous, so I think there must be some bottoms. I sowed some Pearl millet on the 10th of June and it all came up. Now it is two feet high, and I have counted as many as 20 stalks in one stool. I think it will do well with me this year. I tried Early Amber sugar cane and it looks fine; it is three feet high and keeps up with my corn. I planted some of Blount's corn again this year, and it is looking well; I think I can get it acclimated to this section. I prefer it to the Western corn for fodder. I think it is as good as evergreen sweet corn. My cattle ate it last Fall all up clean and the stalks were as large as my arm and 14 feet long. S. J. V. C.

N. Y., Paris, Oneida Co.—On the whole the season has been favorable for vegetation, and crops are generally looking very well, with the exception of hay, already gathered, which has turned out about half the usual yield per acre, except in a few favored localities; but with a good growth of straw and plenty of sowed corn, and economy in the use of fodder, we expect to carry stock through the Winter without any great difficulty. L. R.

OHIO, Bristol, Trumbull Co., July 31.—The season here was pretty dry through the latter part of May and the fore part of June, but since then it has been very wet. Wheat was a good crop, with but few exceptions, but wet weather has damaged it considerably. Some of it is sprouting in the shock. Corn is looking very well but it has been too wet to allow us to work it properly. Oats, too, look fine in places, but in others they have been badly lodged by the wind and rain. More wheat was raised in this township the past season than in any previous one—Democrat the leading variety. Fultz, however, is grown by some and promises well. J. S. B.

OHIO, Ashley, Delaware Co., July 30.—Harvesting is mostly over and thrashing is going on lively. Wheat is not turning out as good as last year. Oats are a poor crop on account of rust. Corn is very uneven; but looks well, considering the backward Spring. No barley or rye is raised here, and very little flax. Apples are about half a crop; hay half a crop—too cold and wet in the Spring. We have plenty of rain and pasture is doing well. Wool has mostly gone to market; and the highest price was 40c. V. M.

OHIO, Roscoe, Coshocton Co., July 30.—Wheat is not quite as good as last year, but is a good crop. Until the last few days it was very dry, but the wet weather since makes corn look promising. Oats in some places are good, and at others, are not fit to cut on account of the rust. Early potatoes are good. We have plenty of apples and peaches on high ground; but a late frost killed nearly all on low grounds. Grape vines are loaded with fruit. C. MC'C.

WIS., Spafford, La Fayettte Co., July 31.—Wheat, less than half a crop (harvested). Oats, good; very good; never better. Corn promises an abundant harvest. Of barley and rye but little is raised; the latter, however, is good—what there is of it. Cow-peas or beans are growing well, but are not yet in bloom. The man-root, as now growing, is closely allied to the cow-pea; in fact, I can see no difference. Mold's Ennobled oats are growing finely, but are only just heading out, other oats being now ripe. I think they will be quite an acquisition, as by sowing the early sorts, in part, and Mold's Ennobled, the harvesting will not be so driving, as Mold's will still be green when the others are ripe enough to cut. W. S.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Blind Staggers in Sheep.

J. W. L., Smith's Grove, Ky., asks, 1, what causes blind staggers in sheep; 2, what will cure the disease; will the offspring of either ewes or bucks that have had the blind staggers, do to breed from.

ANS.—1, Sturdy or staggers in sheep is a species of vertigo, induced by the Cœnurus cerebralis, which is the larva form of the tape-worm called the "Tænia cœnurus." The victims of this disease are generally under one year old, as sheep above two years old are rarely affected. Dogs become infested with tape-worm in consequence of the introduction into their digestive organs of the larva forms of parasites which exist in the brain of sheep, given to them or placed within their reach as a part of their food. Wherever the infested dog wanders and passes excrement *per anum*, there he distributes the ova, which are taken up by the grazing sheep and passed into the circulation, where by virtue of some selective capacity they seem to locate in the brain of their host. Prevention is better than cure; keep diseased meat away from the dogs, or if these are already infested with tape-worms give a vermifuge to expel the parasite (areca nut) before allowing them to run on sheep pastures. The areca nut is administered as follows: Previously, one scruple of jalap, for a dog of 20 to 30 pounds in weight, should be administered, and a brisk action of the bowels set up. This may also be procured by giving the dog a quantity of butter or any of the common purgatives. Immediately afterwards half an ounce of the powder of areca nut is to be given in pills or in some acceptable food. Some locks of tangled wool dipped in grease or melted fat are given at the same to be swallowed. The worm is killed or paralyzed by the areca nut, is entangled in the wool, and all together are expelled by the purge. The mass should be immediately burned or buried at a perfectly safe depth in the ground. Applied to every dog at intervals of three months, this treatment will free them from tape-worms, and prevent danger of the sheep becoming infested with them. As to the treatment of affected sheep, it consists in an operation by which the skull is pierced and the bladder punctured, when the water in it escapes and is absorbed, leaving the worm to perish. The pressure and irritation upon the skull cause some absorption of its substance, and a soft spot is caused over the bladder. This may easily be felt by a pressure of the finger. A curved awl may then be inserted through the skull and the bladder pierced; or by means of a tubular saw (or trephine), a round piece of bone is cut out of the skull, a flap of the skin first being laid back, and the bone being lifted, the bladder is laid bare and removed. The skin is relaid and held in place by a stitch or plaster, and the wound heals. No other remedy than these is safe or certain, and these frequently fail. But permanent cure is rare, and knowing this the farmer consults his own interest by sending the animal to the butcher as soon as the disease is confirmed.

Causes and Remedy for Cloasma.

H. R. S., Cincinnati, O., asks for a remedy for cloasma, and the cause of it.

ANS.—Cloasma is a skin affection, marked by broad, irregular blotches of a yellow or yellowish-brown color, occurring most frequently on the front of the neck, breast, abdomen and groin. The forehead, eyelids, cheeks and upper lip are sometimes affected, which then take a dark-brown color. In woman, in addition to the causes that produce it in man, it is also often associated with disorders peculiar to the sex. In males it frequently appears after protracted malarial diseases. Long-continued action in the sun's rays, especially in a moist atmosphere; many cutaneous affections, as well as those generating a bad habit of the blood, and disorders due to vicious practices, also cause a pigmentary deposit. In many cases sulphur applied externally in any form will speedily remove the discoloration, and should an ordinary application fail, its use in the bath or fumigation is likely to prove more efficacious. The removal of the pigment is nearly always readily accomplished by any means that cause a superficial inflammation of the skin and the desquamation of the epidermis. Cover the affected part of the skin with a piece of linen accurately fitted, and keep it moist for three hours with corrosive sublimate (five grains to an ounce of water); keep the edge of the cloth constantly dried, otherwise the solution will collect and destroy too deeply. A safer remedy, however, in ordinary hands can be found in repeated applications of iodine or iodized glycerine.

Information Wanted.

R. L. B., Lenoir, N. C., says: "I am engaged in manufacturing sirup from sorghum cane and during the season have an immense pile of crushed cane on hand. I have noticed that cattle are very fond of it when partially dried and when partially decayed. Now if it can be preserved in pits like green corn fodder and the hard shell softened by the gentle fermentations of the silo it will be a bonanza to the sirup-makers. Will some one in your paper give his experience with it. The best of mills leave 25 per cent. of saccharine matter in the crushed stalks, and this I think must be valuable if it can be utilized in the silo."

Miscellaneous.

W. H. E., East Setauket, N. Y., asks, 1, is there any kind of rye that is likely to be more profitable for Long Island farmers than that cultivated there for the last 50 years; 2, He planted the RURAL's Beauty of Hebron by itself last year, on May 15, and got three pecks of nice potatoes; this year he planted all his seed on the same day alongside of the Early Rose; the latter are dried up, but the Beauties look as green as if they might grow for the next 60 days, and he asks whether the seed sent was the Late Rose or Hebron.

ANS.—1. We do not know of any. Rye is one of the cereals that need the attention that wheat is now receiving. 2. Unless by mistake, only the Beauty of Hebron was sent to our subscribers.

M. R., Hull, Mass., asks, 1, at what time in the Fall can forest trees be transplanted in safety; and, 2, if the roots are protected with straw or seaweed, will they be safe from winter-killing; 3, if a tree is exposed only a few days in transport, is it necessary to bind up the roots in sacks and moss.

ANS.—1, Any time after the fall of the leaf; 2, there is no danger that native forest trees will winter-kill whether protected or not, but, of course, they must be in the ground; 3, it will depend to some extent upon the weather and the exposure to which the roots are subjected; the roots of transported trees should never be allowed to dry out, and any measure that will prevent this will answer.

J. M., Nunda, N. Y., has a mare that was kicked on the leg just below the gambrel joint last winter and the leg is enlarged from the fetlock to the gambrel. She is not lame; but the appearance of the leg hurts her looks and value. If he blisters it, should he blister the whole leg to the gambrel or only the ankle where it is largest. The animal has had an enlargement of the ankle for two years due to a hurt when a colt. She is fleshy, handsome and high-spirited.

ANS.—Treatment, we fear, in a case of such old standing would be useless torture to the beast, and of no benefit to the owner.

A. L. S., Cleveland, Ohio, asks certain information regarding the Acme harrow advertisement in our columns.

ANS.—Yes, we do recommend the Acme Pulverizing harrow, and we know whereof we speak. If set *right*, it *needs* the weight of a man to do its best work. Certainly it is easier for the man to ride than to follow the implement on foot. Timothy and clover failed on our Clawson wheat-field in consequence of the Spring drought. After plowing the field with a Syracuse Chilled plow, the Acme was used to prepare the land for again seeding to Timothy and clover. It performed its work in every way satisfactorily.

Mr. John Williams of Gallatin, Mo., writes us "Inclosed I send you a new seedling peach which came from seed in 1875, fruited first in 1878, and now stands very full and some of its ripe fruit was gathered on July 21. This tree has not been cultivated at all and its fruit is fully as large as that of the Amsden that grows in the same condition beside it. Amsden, however, ripened this season July 1. Is it worthy of a name and propagation?

ANS.—This peach is of medium size, brightly colored, sweet, juicy and quite worthy of a name.

M. A. P., Sterling Station, N. Y., asks, 1, which is the better for seed—last year's wheat or this year's; 2, which is the better variety, Clawson or Lancaster.

ANS.—1. Good wheat one year old, is just as good for seed as good wheat of the current season. Which is the better will depend on the quality of each. 2, Lancaster makes the better flour, and pleases the millers more; Clawson yields the larger crop and generally pleases the farmer more.

A. N. K. Searsport, Me., asks, 1, what is the best time to set out raspberries; 2, what are the best varieties for that place; 3, how should the soil be prepared and what kind of manure is best.

ANS.—We should prefer Fall here. Spring would be better for your climate. 2. Turner and Cuthbert for raspberries. Would recommend you to try Snyder and Taylor for Blackberries. 3. Just as you would prepare for any other crop. Barnyard manure is best.

L. T., Kings Co., L. I.—The plant is Cleome spinosa. It is very showy, but somewhat coarse for the flower border.

The Querist is a regular department of the RURAL NEW-YORKER, and we do not think that any persons whose questions we answer are thereby placed under any obligations whatever.

ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, AUG. 14, 1880.

A PUBLIC LOSS AND PRIVATE GRIEF.—With sincere regret, in which we know all lovers of horticulture will join, we have to announce the death of our friend and contributor, M. B. Bateham, of Painesville, Ohio. He died August 5th. We shall furnish an excellent portrait and sketch of his life probably next week.

A MISSTATEMENT CORRECTED. — We have seen circulars sent to certain seedsmen from Mr. Mold, of England—him of "Ennobled" grain notoriety, setting forth that our "Minister of Agriculture" reports great success with his (Mold's) red and white winter wheats in this country. Gen. Le Duc informs us that, except in California, this grain has not proven a success, and that Mr. Mold's statement is unauthorized.

THE FLAX-SEED CROP.—From the present outlook this year's flax-seed crop will be the biggest ever known. Iowa, Illinois, and Kansas have raised extraordinarily large crops. At the outset, however, there has arisen a serious difficulty in transporting the product to market. Owing to the great loss in transit, due to its extremely slippery nature, the railroad companies are refusing to carry the seed in bulk unless shipped in cars made unusually tight for that special purpose, and there are no cars of that sort. Country buyers are writing for bags to commission men in Chicago and other large centers in the West, but it is said there are not bags enough there to move half the crop.

THE YELLOW SCUM ON MILK.—A lady friend has just related to us an incident which is too good to be lost. It illustrates what some New-Yorkers know about milk, and may amuse our readers. The friend owns a handsome country-seat on Long Island, and keeps fine Alderney cows, which, as almost anybody knows, yield very rich milk. The place adjoining hers was hired by a New York family for the season, and they begged her to furnish them with milk, which she consented to do. In a few days, however, her man brought her word that the newcomers had concluded not to take any more milk from her cows. They said they didn't like the "yellow scum" they found on it every morning!

UNCERTAINTY AS TO THE PARENTAGE OF SEEDLING POTATOES.—Of over sixty varieties of potatoes (more or less—we have not counted them) we have thus far failed to find pollen upon one of the flowers which have bloomed up to this time. One object in planting so many kinds was that we might make crosses, and thus be enabled to raise cross-bred seedlings another year. Hundreds of new seedlings are now presented every year, with both parents given as a matter of fact, and "hybrid" seeds are sold in packets for—considering the labor and time involved in producing them—a very low price. We are beginning to believe that the parentage of many of our new potatoes and the hybridizing of these "hybrid" seeds, are merely guessed at or are altogether fictitious. Of course, "seed balls" do form and in such cases there must be pollen. But to find this pollen and to apply it so that a cross is *known* to have taken place is a task that very few have either time or patience to accomplish.

A LESSON FROM THE CIRCUS.—We don't highly approve of circuses, yet we have no doubt there may be "good in everything" if we know how to get it out. Last year a "Grand Combination" exhibited in a field which lies sloping to the west, opposite the window where we now write. That field was mown two weeks ago, and those two weeks have been weeks of drought and heat. The whole field is dry and brown, except four parallelograms at equal distances, each about 25 by 40 feet, which are of a vivid green. These spots are where the horse-tents of the circus stood for about twelve hours. What a marvelous illustration they are to our mind of the value of manure as a protection against the effects of drought. The top-dressing given by the 100 horses that stood under those tents for a short half day made all this difference between a total arrest of growth under a July sun and a close and thrifty aftermath. If the drought continues, these patches may be all the living grass left in that field next year.

PRICES OF HOPS.—Hop-growers should not be too ready this season to dispose of their product except at good figures. At this time last year there were in the country about 60,000 bales of old hops; to-day the most reliable information says that there is not a quarter of that amount in all hands, while many trustworthy persons maintain that there are not over 5,000 bales in the hands of dealers all over the United States—less than half the average monthly consumption—while brewers, on the whole, have but a small surplus to fall back upon should prices of new hops be high. In this State the first of the new crop, "Palmer Seedlings," will probably be marketed from the middle to the end of this month, and will hardly be more than 150 bales. The "Humphrey," the next, will, most likely, be ready to pick during the last week in August, and now promises a yield of from 700 to 800 bales, most of which will be probably exported, as usual; so that by the time the regular crop comes into market the supply of old and early will be very small. The consumption of beer the past year has been greater than ever before in a like period, and is rapidly increasing. The most trustworthy advices from abroad declare that the growing crops will be below rather than above an average, so that while the demand will, almost certainly, be greater than heretofore, the stock on hand is unusually low and the foreign supply is hardly enough for home consumption. It would seem, therefore, that growers are in a position to fix the prices during the early part of the season, provided they do not lend a credulous ear to agents paid to buy hops at the lowest possible figure.

"STAMINATE" STRAWBERRIES.

IF "pistillate," as applied to strawberries, means that the variety possesses but one set of generative organs, why ought not "staminate" to mean that the variety possesses the other set and that only? But the latter word is often used in the place of "perfect," which is just as far from staminate as it is from pistillate. That is to say, a "perfect" flower is possessed of both sets of generative organs, viz., both stamens and pistils. We hope that our small-fruit authorities will eschew the use of the word staminate *in toto* as meaning perfect bisexual or hermaphrodite flowers. We have no use for it at all.

Dr. Gray defines pistillate or female flowers as those in which the pistils are present and the stamens absent; and a staminate or male, as one in which the stamens are present and the pistils absent. Why, then, when we have bisexual or perfect, either of which is just exactly the word needed, should we use staminate, which is well established by the best authorities as having a signification the reverse of that which it is desired to convey.

To show that many of our writers upon small fruits use the words "perfect" and "staminate" interchangeably, we quote from Mr. Roe's new and elaborate work, page 93:

"When both stamens and pistils are found in the same blossom, it is called a *perfect* flower or *staminate*.

BLOUNT'S CORN AT THE RURAL FARM.

WE measured our Blount's Corn Aug. 7, and found the average hight to be fully eleven feet. The highest is twelve feet and the lowest ten. But uniformity in the hight is one of the remarkable features of this remarkable variety of corn. All of our visitors who have seen it say that it is the finest field of corn they have ever seen, and the yield at present promises to be over 100 bushels of shelled corn per acre. The average number of ears per stalk is not less than three, while many bear six and seven, a few eight, and several nine. The ears will be small, certainly, especially the lower ones of those stalks bearing a great number. But, small as they are, we find that there are generally as many as forty-five kernels in a row, while the rows run from ten to fourteen. There has been no "fancy" cultivation or fussing with this acre of corn. No barn-yard manure and only about 350 pounds of concentrated corn fertilizer was used, which was applied at three different times—once before the corn was planted; then when it was three inches high, and last when one and a-half foot high. Should the yield fulfill its present promise, we shall give the particulars of its cultivation hereafter.

It will be remembered that we raised on one-quarter of an acre, last year, at the rate of 72 bushels of shelled corn per acre. But this was under unfavorable circumstances, the chief of which was the stinging frost of June 10. This year *everything* has been favorable, and one acre or more (the exact measurement has not yet been taken) is being raised, so that there will be no "at the rate of" about it. The yield, whether great or small, will be a fair index of what Blount's white Prolific Corn will do on Long Island.

RESTRICTIONS ON AMERICAN CATTLE IMPORTATION.

IN England, on August 5, Mr. Arthur Arnold, Liberal Member of Parliament for Salford, offered in the House of Commons a resolution that in the opinion of the House the regulations regarding the landing of fat stock from the United States restrict the supply and increase the cost of food, and in view of the freedom from disease of the cattle-producing States of America, the House deems it desirable that the government should consider the restrictions with a view to their modification or removal. The first part of this resolution closely follows one offered in 1878, for which twenty-four members of the present government voted, so that it certainly has considerable support now in the administration.

From the first we have strongly protested against the restrictions placed on the importation of cattle from this country into the United Kingdom, on the plea on which those restrictions were founded, while earnestly urging the removal of even a pretext for such restrictions by the entire suppression of pleuro-pneumonia among our herds.

Investigation conclusively proves that, even after the hardships of a long voyage and of an antecedent long journey by rail, American cattle are landed in England in a state more healthy on the average than that of the cattle of the United Kingdom. Last year 76,117 head were imported from the United States, of which only 137 were affected with pleuro-pneumonia, even according to the statements of the examiners at the ports of landing, and considerable doubt has been thrown on the correctness of their diagnosis. Of this vast number 68,000 were conveyed in vessels in which no disease was found. The expense to which the United Kingdom was put by these obnoxious restrictions was double the cost of suppressing the most virulent outbreak of the plague among native herds some years ago, the former amounting to sixteen million pounds sterling, and the latter to only eight millions.

In reply to the resolution, Earl Spencer, Lord President of the Council by whose orders the restrictions were imposed, dwelt strongly, as the chief cause for their unmodified retention, on the law regulating the transport of cattle in the interior of this country, stating that he had been informed that it was illegal to stop the free importation of cattle from one State to another within the Union.

As a matter of fact, the importation of cattle from New Jersey into this State was some weeks ago rigidly prohibited by Gen. Patrick, who has been commissioned by the Governor to suppress pleuro-pneumonia among the herds of New York State, and the legality of the prohibition, which was due to the prevalence of the plague in some sections of New Jersey, we have never heard called in question. As this condition of our laws was assigned as the principal cause for not making any distinction between ports of shipment in the United States, we trust that the practical proof to the contrary thus offered by the authorities of this State, will lead at least to the speedy exemption from the restrictions, of cattle shipped from sections and ports entirely free from the plague.

BREVITIES.

WE learn from Aiken, S. C., that the RURAL Branching sorghum, in spite of excessively dry weather, is making fine growth. From the same source we learn that the "Cuzco" corn has now some "half a dozen nubbins of ears."

WE learn that Mr. Dunham sent his brother out to France last June for fifty Percheron stallions, but his trade has since been so encouraging that he has bought ninety-eight, all of which he expects to arrive in the steamer Greece, now due in New York.

As a good specimen of the care and industry bestowed on their reports by many—very many—of our friends, we would refer our readers to the "Everywhere" from Burlington, Coffey Co., Kansas. To an intending emigrant, such a full account of the products of that section must be useful; to others, at least interesting.

WITHOUT the slightest disposition to write an "alarmist" article, says the Mark Lane Express of latest date, we must reluctantly come to the conclusion that the harvest of 1880 cannot now be the means of saving any considerable proportion of sinking farmers from the ruin which threatens them. We sadly fear agricultural depression has not reached its lowest points.

THIS from the letter of a friend just received: "'Horticola' has pulled my latch string, and he told me such a 'whopper' about your corn which he saw last week at the Rural Farm (12 or 14 feet high and six to ten ears to a stalk!) that I—I—I— felt ashamed of our *tall corn* and consoled myself with the idea that there was room enough on the stalks for all the ears that were inclined to grow. If you have such stalks you had better exhibit a few at the various fairs."

IT is usual among gardeners to save the seeds of the first tomato that ripens, no matter how small or ill-shaped. It is better to wait a few days and select seeds from the largest, firmest specimens and those which ripen fully about the stem. We want tomatoes that will keep longer than any now cultivated. To this end, it would be well to save as many as could be spared and, exposing all in the same manner, select seeds only from those which remain firm and sound the longest.

WE have occasionally referred to a dwarf catalpa under the name C. Kæmpferi. It is a very distinct-looking shrub, the large leaves, of a bright, cheery-green color, growing so thickly as to completly conceal all branches. The form which this bush takes reminds one of a small balloon completely covered with foliage. Well, it appears that instead of calling it C. Kæmpferi, it is probable that it is a dwarf variety of the American Catalpa, C. biguonioides.

IN many lowlands and low-lying woods, thousands of racemes of a pretty white flower may now be seen. It is the Clethra alnifolia—a name which generically and specifically tells of a resemblance to the alder. But it is in the leaf not in the flower. Though found, for the most part, in swamps, it grows vigorously in dry uplands. It belongs to the Heath tribe of plants. Mention is made of the Clethra at this time, so that our readers may have their attention called to the shrub while in bloom, which may induce them to find a place for it in their gardens at a suitable time for transplanting in the Fall.

AMONG the friends well known to agriculture or horticulture, who have the present season visited the Rural Farm, we may mention Samuel B. Parsons, Gen Le Duc, Henry Stewart, Mason C. Weld, F. W. Bruggerhof (Thorburn & Co.,) W. H. Gleason (R. H. Allen & Co.) Samuel Parsons Jr, and Peter B. Mead. The interest they manifested in our tests and the growing crops, and the pleasure which they seemed to derive from examining them were very gratifying to the folks of the Rural Farm.

THE MEAT CANNING BUSINESS is growing to vast proportions in this country, especially in Chicago, which now has in operation more canning factories than the whole of the rest of the country. Prices at the factory are 20 cents a pound for cooked beef and 25 cents a pound for cooked and pressed tongues, the canned goods, of course, consisting entirely of good, nourishing food. This kind of food should be used in many more households than it is at present. In country places where the butcher's cart is seldom seen, what greater convenience can there be than that which enables the housewife at a moment's notice to place on the table the best of beef, tongue, ham, bacon, chicken or turkey.

FROM the best data at present attainable this year's wheat crop will amount to about 290,000,000 bushels, and over and above the amount required for seed and home consumption, we shall have a surplus of about 180,000,000 bushels for export. If our wheat production is to be kept up at anything like its present magnitude it seems not unlikely that we must be willing, at least at the outset, to sell at prices which will force many of our foreign competitors to withdraw from an unprofitable branch of industry. From the latest European advices, however, it seems that the crops across the water, especially in England, are so poor that we shall find a much better foreign demand than we had reason to expect some time back.

IT has been generally supposed that to bury the body of an animal that had died of anthrax, or black-leg, was an effective mode of preventing contagion from the carcass. In a paper read by M. Pasteur, the celebrated scientist, before the Academy of Sciences, Paris, on July 13, it was shown how the common earth-worm may be the means of propagating the disease under such circumstances. When putrefaction advances the parasites that generate the malady are destroyed, but some infected blood and other liquid matter escape into the earth surrounding the body producing germs that may remain inactive for years, but which contain life capable of producing anthrax whenever the opportunity presents itself. Often the germs appear at the surface of the ground over the body of the animal, and Pasteur says they seem to get there through the agency of earth-worms that carry them in their alimentary canals. When the dust of this earth brought up by the worms dries, it is blown upon the plants eaten by the animals which thus become affected. Germs of other diseases, it is thought, may be conveyed in like manner.

Literary Miscellany.

FOUR-LEAFED CLOVER.

Long, long ago I read of one who sought
So far and wide, in many climes and ways,
For four-leaved clover: but he sought in vain,
And went home empty after many days.

Weary at last, he sat by his own door,
And there, right at his feet, the treasure found.
It was so near he had not thought to look
So near at hand and on such homely ground.

And so we often overlook what lie
Right at our feet, and call them common things.
The bird of brilliant plumage and no song
I count less lovely than the bird that sings.

"But O, we are blind. "Had I that gift,"
We say, "were this good or that talent mine,
How would I use it? What good would I do?
Poor blind mortals! how we "seek a sign!"

Each one of us has for its earnest use
Some talent given, five or two or one;
It is no small thing if we use it well,
No small thing if we miss the words, "Well done."

And many blessings come as falls the dew—
Unheard, unseen—and we perceive it not,
So many a battle's fought and victory won,
Where, calm and silent, no man knows the spot.

The four-leafed clover grows right at our feet,
The good is here that we so long have sought.
Let us be watchful lest the clover grow
So low and humble that we know it not.

LILY DAVIS.

CHAPTER I.

"Which is the prettier of the two? Why, the little dark one, of course. Who is she, by-the way?"

"Haven't the slightest idea; only saw them yesterday. Don't admire your taste, though, Hammond.

"As you like; in my opinion the dark one is the prettiest girl I have yet seen in Ryde; and I lay you twenty to one that I know her before the week is out."

"Not at all improbable," returned Rutherford, adjusting his tie. "When you do know her, introduce me to the sister—should think they are sisters, they dress alike."

"Y-yas; rathah neat get up—those blue jerseys," broke in a third speaker, who had just dropped his eyeglass after a long stare in the direction of the sisters. "What do you say to cutting wound by the band and having anothah look? We should meet them."

"Better stay where you are; tney will come back," said Hammond, drily.

"To look at you, I suppose? I declare you are getting insufferable," returned Rutherford, good-humoredly. "Can't imagine what the girls see in you to admire."

The two young men turned off together down the pier. A glance would tell you what they were. Young subs, from their heads to their shining boots. Square shoulders; irreproachably-fitting coats, faultless trousers, straight collars, light ties, hats the sixteenth-part of an inch on one side, an erect carriage, with the faintest suspicion of swagger, just enough in their own estimation, to raise them above the common herd, and prove undeniably to outsiders that they were officers and gentlemen. Good-looking fellows they were undoubtedly, and frank, good-hearted fellows also, despite their youthful vanity, which was harmless and very amusing.

The worst of the three companions was the man they left leaning against the pier-rail, Arthur Hammond. Older, taller, and broader than either of the other two, a magnificent figure six feet two inches in hight, a manner half-frank, half-cynical, with a dash of carelessness in it that possessed an extraordinary charm for most people who knew him, and a face that had a certain dark beauty of its own, but which a coarse mouth prevented from being strictly handsome.

"I like that little thing," he soliloquized. "I wonder who knows her? I must get introduced; it will be something to do, and things have been frightfully slow for the last fortnight."

Just then the sisters in question came slowly in sight, and bowed to a young man, ensconsed in one of the covered seats, as they passed.

"They know Brimley," pursued Hammond to himself. "That will do; he isn't in our set, but I will get him to do the formal and drop him afterwards; probably they are not in our set either, but it doesn't matter."

The wearers of the blue jerseys—Mabel and Lily Davis—paused at the pier-head, and looked over the sea and down at the boats rocking lightly beneath them.

"Here comes the Southsea steamer," said Mabel, looking where the crowded packet-boat was noisily beating her way through the calm blue water. "Shall we go and see her come in?"

"More vanity and vexation of spirit!" sighed Lily, comically. In flat contradiction to her name, she was the brunette. "No: I don't want to see the landing; there are sure to be the usual number of nice people we would like to know and can't, I am sick of it, Mab; we are the best-dressed girls on the pier, and you are the prettiest, and yet we don't know a soul worth speaking to."

"Don't fret yourself about it now, Lily. Let us be thankful that we are here together for an hour."

"Certainly it is a treat, Mab," said the other, with a look at her sister that had a world of love in it. "I would give anything to know those Carruthers girls, but I expect they would never know us; and yet people *do* get into a nice set who are no better than we are. How do they manage it, Mab?"

"They are richer than we are, that is the secret," returned Mabel, turning her delicate profile away from the sunlight. "Money covers multitude of sins. If we had twenty thousand pounds a-year, people would forget that we were ever connected with a livery-stable."

A little vindictive sparkle came into Lily's soft eyes.

"Marry Brimley, and you will have money enough: I'm sure he worships you."

"I hate Brimley!"

"Be quiet," said her sister, quickly. "He is coming this way; and I declare, he has one of the officers with him. What an extraordinary thing! I didn't know he knew any of them."

Little Brimley came up blushing. He was a genuine little fellow, despite his lack of polish, and his adoration of Lily was unfeigned and sincere.

"How d'ye do, Miss Davis—a beautiful afternoon, is it not?—Let me introducc my friend Mr. Hammond."

Hammond raised his hat gracefully to the sisters.

"Are you not too far from the music to enjoy it? Shall we stroll nearer?" he said, his well-bred voice sounding pleasantly in their ears; and in another minute Lily found herself walking by his side, while little Brimley followed abstractedly with Mabel, contenting himself with the back view of Lily's graceful figure, and envying Hammond from the bottom of his heart.

There was the usual light, mutual cross-examination that takes place when two people first become acquainted with each other.

"Were you at the concert last night, Miss Davis?"

"Yes; odd I didn't see you. Where did you sit?"

"In the second row of seats."

"Ah! I was farther back. You were near the Carruthers, then? Nice girls—do you know them?"

"No; we don't know any one here," coldly.

"Then I consider myself fortunate in being the first to make your acquaintance," gallantly.

After this the conversation became more interesting. Hammond never lost an opportunity of conquest, and the present prize was attractive enough to warrant some trouble in the winning of it. It was not what he said that fascinated his victims, but the winning intonation of his voice, and the softness of the glance that accompanied the most ordinary sentence—a glance more full of subtle flattery than a string of conventional compliments, and which few women could resist. In a very short time, without actually saying so, he had inferred that Lily was the fairest specimen of girlhood in the country, that her appearance in Ryde had suddenly awakened in him an interest he had never felt before; that he had vowed he would move heaven and earth for an introduction; and that now he had obtained it he would absolutely *languish* for their next meeting.

At the same time he was mentally taking notes of her in his own fashion.

'Simple little thing! Not in society, but would like to be. Is she powdered or not? Can hardly tell."

As for Lily she was happy. In her opinion she had the handsomest man on the pier, as her cavalier was certainly the tallest; more than all, he was a gentleman, and this was his greatest charm for her. She was not so foolish as to believe implicitly all his words implied, but she knew she was pretty, and it was very pleasant to think that he had been struck with her, and preferred her society to that of the many girls he bowed to as they passed them in the stream of promenaders.

The sun stooped lower towards the sea. The music stopped. The people began to disperse.

"Six, Lily, and we promised to be in at half-past; we must go back," said Mabel.

"We go the same way, I believe?" said Hammond.

And they went the same way, and he parted from her at the door, with a lingering pressure of the hand and a low "I may hope to see you to-morrow, may I not?"

Lily went in with flushed cheeks.

"He is so delightful," she said to Mabel. "So unlike the usual men we meet; and he really seems anxious to know us."

His attentions flattered Lily and pleased her; but at the same time there was a little drop of bitterness in her cup.

His sisters were in Ryde, and he did not introduce her to them.

If Mrs. Davis had been a sensible woman, she would not have allowed her daughters to receive any attention from a man whose mother and sisters did not consider them their equals; but she was weak and good-natured, and rather encouraged than thwarted the intimacy, and so the mischief went on.

The six weeks drifted by.

"Only one more evening, and then we go back to the old dull routine, Mab? How I shall hate it: how I shall hate the people we meet after this little oasis in the desert."

Mabel's only answer was to kiss her, and stroke the pretty dark head that had dropped upon her shoulder.

"We shall come here again next Summer; mamma said so to-day; but I almost hope you won't see Mr. Hammond any more, childie."

"Why?"

"I don't know—I don't believe in him somehow or other. He is very irresistible; but don't lose your heart to him. I am sure he is an utter flirt."

"I am sure of it, too, but let me be happy, now, Mab."

There was witchery in the music that night, a glamor in the lamplight and starlight, a dreamy melody in the low wash of the glistening waters against the wooden landing-stairs. It was a night whose influences swept the strings of love and sorrow, and set them singing in many a heart.

"Don't go in yet," said Hammond, as they left the pier together.

"I must," said Lily, feebly.

"Why should you? your mother and sister are far behind, and they have Brimley with them. Just one more stroll by the rock-walk. It is our last evening, Lily."

Lily looked doubtfully back towards her mother, and wistfully in the direction of the rock-walk.

"Do come," he pleaded. "I have so much that I must tell you. Your people know you are with me. Don't be cruel, and refuse me a last walk; think how wretched I shall be when you are gone."

Would he really be wretched? Her heart throbbed with delight; and he had so much to tell her. Who knew what it would be?

"Well, for half an hour—no more."

The rock-walk was almost deserted. They sat down on a sheltered seat, just large enough for two.

"What time do you start?"

"Mid-day, I think."

"How the time has flown?"

"Time generally goes quickly at the sea."

"Don't talk in that matter-of-fact tone; turn round. I want to see your face," he said, bending his head to hers.

"I'm sure my profile will do as well, it's better than my full face," she answered, mischievously.

"Lily, you shan't teaze me on our last evening. Remember I may never see you again."

The laughter went out of her face in a moment.

"We shall come back here next Summer," she said, with a little wistful glance at him that said so much more than her words.

"And I may be at the other side of the world; there is a rumor of our being ordered out next year."

This was a reserve shot of Hammond's that always told.

"Ordered to India?" she said, and was it the word India, or a colder breeze from the sea, that made her shiver involuntarily?

"Lily, you will write to me, won't you?"

"I haven't got your address."

"I will give it to you, and I know yours. By-the-by, do they read your letters at home?"

"Sometimes. I expect mamma would wonder why you wrote, and want to see."

"Humph! Well, look here, I shall find an excuse to write to you easily enough. I shall write an ordinary epistle, and slip it in a private sheet for yourself, and you need only show one. Do you understand, pet?"

Mr. Arthur Hammond had entered into this honorable arrangement with at least four other young ladies at Ryde and Southsea, though, to their credit be it known, that each girl fondly believed herself to be his only correspondent.

"But won't you—won't you tell mamma?" she said, hesitatingly, playing with the links in his cuff.

"What! tell her that I love you, with my present prospects? She would box my ears for me. No, little woman; no one must know of it but you and I; and after all, darling, it concerns no one else. You don't love any one more than me, do you?"

Ah! the look of perfect heart-surrender she gave him from her lovely eyes! It should have aroused him to a sense of the sorrow he was dealing her. It should have sent him on his knees at her feet to beg for her forgiveness. But he had played the game too often to be troubled by such trifles."

"We must go back! I am sure we have been longer than half an hour. I shall get scolded! Oh, do come!"

"You don't think I am going to let you go like like this?"

What foreboding was it that made her hesitate? Had he not told her he loved her? Did she not consider herself engaged to him now?

"No one has kissed me before," she murmured, hiding her face.

"All the more reason why I should!" And laughing, he held her hands fast and, stooping down, took away the first freshness and purity from the sweetest lips that he had ever kissed.

Poor, foolish little Lily, had she only known how bitterly she would regret those kissses! They seemed a sacred seal and sign of love to her; they were merely a minutes amusement to him.

They strolled slowly homewards after that, and parted at the dark, open doorway of the house where the Davises were staying. He took her face in both his hands.

"I shall want a letter every week. Good-bye, darling, good-bye!"

As she sprang up the stairs, flushed and glowing with his warm kisses on her lips, she met Brimley on the wide, lamp-lit landing. His face was very pale, but she did not notice it; she only noticed that he looked short and very plain after the splendid specimen of manhood she had just left,

"One minute, Miss Davis, I implore you! Give me a minute's time to speak to you!"

She halted impatiently; she was eager to pour the story into Mabel's ears.

"I am dreadfully tired, Mr. Brimley!"

"I know. I feel I am a brute to keep you, but I must speak." He grasped the banisters in his nervousness. "I have been telling your mother to-night what you must have guessed long ago, and she has given her consent——"

"To what?" gasped Lily.

"Oh—oh! Lily—Miss Davis—I know I am a rough, unpolished fellow, and can't flatter you and make low speeches, but I love you—upon my honor I love you more than I love my life! Heaven only knows what I have suffered this last fortnight, Lily! Won't you say a kind word to me Lily!

He caught her hands, but she wrenched them away.

"Don't; you frighten me, Mr. Brimley! I—I don't love you—I never could! I am very sorry. Good night."

She turned and fled up to her room and shut the door. Brimley was an honest, worthy little fellow, the son of a rich tradesman, and the liberal allowance he received from his father equalled the incomes of half a dozen of the subalterns of the 200th Regiment. He was in love for the first time in his life—steadily and truly; and he would have made Lily a happy wife, so far as love and devotion can make a woman happy.

"I know what has done it," he muttered to himself. If that officer had not come in the way she would have loved me!"

Meanwhile Mr. Arthur Hammond sauntered contentedly home to his quarters.—[To be continued.

MAGAZINES FOR AUGUST.

The Herald of Health.—Contents: Common Mind Troubles; Feminine Athletics; The Wisdom of Trust; Humorous Paragraphs; A Presidential Candidate; What shall we do with our Daughters? Record of Hygienic Progress; Good Habits Taught in the Sunday-school; Courage; Darwin's Reply to a Vegetarian; Diphtheria from bad Water; Soda and Saleratus; Garments for Little Girls in Warm Weather; Bread and Disease; Light Unleavened Cakes; To Cure Fits of Sneezing; The Era of Pads; Sanitary Errors; Honors to Woman; To Test Milk for Water; Women's Headaches; Mouth Disinfectant; The Treatment of Sprains; Current Literature; Health Foods.

What Shall We do with our Daughters?—The question at the head of this article is going the rounds of the newspapers, and receiving all sorts of answers, according to the opinions of the various writers who discuss its merits. It does not seem a very difficult question to answer.

Let us give our daughters a scientific education. It is just as useful for them as for our sons. Then they would cease to read so many novels, which only excite that part of their nature already too well developed. The knowledge of various sciences would remove from woman's life a very grave danger; that of sentimentalism. Novel reading develops the sentimental, the emotional sides of their natures. A study of the sciences would develop the more cool, self-reliant womanly character.

Much more might be said. We will only add, so far as possible fit them for those duties of life which are almost sure to come to them after they become mature. Thus will they become more charming as daughters, more useful as women, more happy as mothers.

The American Naturalist—Contents:—The Fabrication of Aino Cloth; English Birds compared with American; On the Age of the Laramie Formation as indicated by its Vegetable Remains; Notes on the Flowering of Saxifraga Sarmentosa; Destruction of Obnoxious Insects by means of Fungoid Growths; Recent Literature; General Notes; Botany; Zoology, Anthropology, Geology and Palæontology, Microscopy; Scientific News; Selected Articles in Scientific Serials.

This number maintains its usual standard. The articles are treated in an entertaining manner, while they are filled with the power of enlightenment obtained from scientific research. Readers must be educated to a point of appreciation for deep literature to enjoy the contents of its pages, and for such it is intended.

Good Company, Number Eleven, opens with Notes of Travel, by Charles Dudley Warner, at the end of which he throws the charm of his style about an account of the immense Chicago stock-yards in a way to delight the new Porkopolis.

An idea of the prevailing Southern diet and the obstacles to introducing improved methods in cooking is given in an account of personal experience by Mrs. Helen Campbell.

Those familiar with the attractive grace of E. S. Gilbert's nature-studies will not need to be told that his "Midsummer" is adapted to the season and entertaining. Seasonable, too, is Dora Read Goodale's vividly descriptive poem "A Summer-night Storm," and another gracefully descriptive bit of verse, "Sunshine." Mrs. Celeste M. A. Winslow's verses, "Border-lands," have decided merit.

Octave Thanet has the "Romance of a Medicine Bottle," and there is a full allowance of stories by Ellen W. Olney, L. K. Black, Mabel S. Emery and David Ker; also contributions from B. F. DeCosta, Mrs. Edward Ashley Walker and J. B. T. Marsh; and several shorter sketches.

BRIC-A-BRAC.

"The census infamy" is what it is called now by the jealous citizens of St. Louis who have heard that Chicago has the larger population.

An Omaha bride was married barefoot because her husband's family went that way, and she didn't want to seem proud.

Doctor—"You must drink claret to build up your system." Patient—"Oh, don't ask me to do that, doctor. I am a wine merchant; I know how it's made."

Old "Speckle" rose from off her nest
And cackled with much vigor,
As if to say, "That egg's my best,
No hen can lay a bigger."
While Johnnie, standing near the gate,
In mute contempt was gazing,
As if he could not tolerate
The fuss the hen was raising.
His protest took her down a peg—
He raised his voice to say it—
"You fink you're smart—Dod made zat egg—
You toodn't help but lay it!"

A clergyman in Pittsburg lately married a lady with whom he received the substantial dowry of ten thousand dollars and a fair prospect for more. Soon afterward, while occupying the pulpit, he gave out a hymn, read the first four stanzas and was reading the fifth—

Forever let my grateful heart
His boundless grace adore—

when he hesitated and exclaimed: "Ahem! The choir will omit the fifth verse," and sat down.

The congregation, attracted by his apparent confusion, read the remaining lines—

Which gives ten thousand blessings now
And bids me hope for more.

THEN AND NOW.

'Twas in the gloaming,
By the fair Wyoming,
That I left my darling many years ago,
And memory tender,
Brings her back in splendor
With her cheeks of roses and brow of snow.

But where in thunder,
Is she now, I wonder?
Oh, my soul be quiet, and my sad heart hush:
Under the umbreller
Of another feller—
Ah, I think I see her paddling through the slush.
—Deadwood Pioneer.

SCOLDING.

A LITTLE girl, not six years of age, screamed out to her little brother, who was playing in the mud:

"Bob, you good-for-nothing scamp, come right into the house this minute, or I will beat you till the skin comes off."

"Why, Angelina, Angelina dear, what do you mean? where did you learn such talk!" exclaimed the mortified mother who stood talking with a friend.

Angelina's childish reply was a good commentary upon this manner of speaking to children;

"Why mother, you see we are playing, and he's my little boy, and I am scolding him just as you did me this morning; that's all."

SMALL THINGS.

The smallest crust may serve a human life;
The smallest act may lead to human strife;
The smallest touch may cause the body pain;
The smallest spark may fire a field of grain;
The simplest deed may tell the truly brave;
The smallest skill may serve a life to save;
The smallest drop the thirsty may relieve;
The slightest look may make a heart to grieve,
Naught is so much but that it may contain
The rose of pleasure or the thorn of pain.

A GOOD CHARACTER FROM HIS LAST PLACE.

In Galveston, as elsewhere in Texas, when a prisoner has no money to employ counsel, the judge appoints a young lawyer to defend the doomed man, very much as the pauper patients in a hospital are turned over to the young doctor to learn the professsion on. Not long since quite a young lawyer was appointed to defend a man for burglary. The young lawyer, after consulting with his unfortunate client, said:

"May it please your Honor, I want this case continued until I can procure the attendance of material witnesses."

"What do you expect to prove?" asked the court.

"I expect to prove that my unfortunate client is a quiet, sober and industrious man."

"By whom do you expect to prove that?"

"By the officers of the penitentiary, where he has spent the last five years."

PLANTING HIMSELF TO GROW.

Dear, little bright-eyed Willie,
Always so full of glee,
Always so very mischievous,
The pride of our home is he.

One bright Summer day we found him
Close by the garden wall,
Standing so grave and dignified
Beside a sunflower tall.

His tiny feet he had covered
With the moist and cooling sand;
The stalk of the great tall sunflower
He grasped with his chubby hand.

When he saw us standing near him,
Gazing so wonderingly
At his babyship he greeted us
With a merry shout of glee.

We asked our darling what pleased him
He replied with a face aglow.
"Mamma, I'm going to be a man;
I've planted myself to grow."

WHY HE GOT A RECEIPT.

The following story is told of a crafty lawyer, subtle as a fox, who lived in Halifax:

An Indian of the Miami tribe, named Simon, owed him some money. The lawyer had waited long. His patience at last gave out, and he threatened the Indian with lawsuit, process and executions. The poor red man got scared and brought the money to his creditor. The Indian waited, expecting the lawyer would write a receipt.

"What are you waiting for?" asked the lawyer.

"Receipt," said the Indian.

"A receipt?" said the lawyer, "a receipt—what do you know about a receipt? Can you understand the nature of a receipt? Tell me the use of one and I will give it to you."

The Indian looked at him a moment, and then replied:

"S'pose maybe me die; me go to heben; me find the gate locked; me see the 'Postel Peter; he say, 'Simon, what you want?' Me say, 'Want to get in.' He say, 'You pay Mr. J——dat money?' What me do? Me hab no receipt. Hab to hunt all ober the other place to find you."

He got a receipt.

TOO MUCH FAITH.—Traveling on one of our railroads, a little four-years-old lump of boy humanity kept his father and mother in a state of chronic fidgets by continually thrusting his head out of the window to explore the outer world. All remonstrance and threats were unavailing. Finally a bright idea struck the father.

"Fred, Fred," he said, "keep your head in or the wind will blow your hat off!" And in order to frighten his hopeful he slyly slipped the hat off the little one's head and concealed it. As soon as this had been done the child began crying and could not be appeased. Finally "pater familias" told him to look in an opposite direction and he would whistle the hat back again—all of which was very neatly done, and the happy parents settled back in their seats and began to converse very pleasantly, thinking they had cured little Freddie But not so, for in a short time he seemed to brighten up, and away he sent his hat through the car window, shouting, as it disappeared:

"Papa, whistle again."—Patriot.

HISTORICAL SNATCHES.

NOTES and bills first stamped, 1782.

Use of quicksilver, discovered in refining silver ore, 1540.

Pens for writing were first made from quills in 635.

Paper money first used in America, 1740.

Signals at sea first devised by James II., 1665.

Tulips first brought into England, 1578.

Thread first made at Paisley, in Scotland, in 1722.

Mortars for bombs first made in England, 1543.

Microscopes first used in 1621; the double ones, 1624; solar microscopes invented, 1740.

Letters were invented by Memnon, the Egyptian, 1822 B. C.

Earthen vessels were first made by the Romans, 715 B. C.; the first made in Italy in 1710; the present improved kind originated in 1763.

Insurance policies were first used in Florence in 1523; first society established at Hanover, 1530; that at Paris, 1740.

For Women.

CONDUCTED BY MISS RAY CLARK.

ROSEBUDS.

In the merry month of roses, around the wanton vine,
Her slender, rose-tipped fingers in careless grace entwine.
As the silver moon is fading before the radiant show
Of the gorgeous golden sunrise which sets the heavens aglow,
The maiden's dainty fingers, as in eager quest they fly,
Weave meshes round the tender heart of him who stands close by,
Gazing with all his ardent soul on her he loves so well,
Enchanted and enraptured by the sweet, resistless spell.
As glorious as the morning is the charm that binds them there,
Where diamond dewdrops glisten in the incense-laden air,
For on golden wings the phantoms which they eagerly pursue
Will fade away as sunbeams drink the beauty-giving dew;
For in the sunrise of their lives the youth and maiden stand,
Intent upon one purpose with eager heart and hand—
Picking rosebuds.

MY GOOD FOR NOTHING.

What are you good for, my brave little man?
Answer that question for me, if you can;
You, with your fingers as white as a nun;
You, with your ringlets as bright as the sun!
All the day long with your busy contriving,
Into all mischief and fun you are diving;
See if your wise little noddle can tell
What you are good for. Now, ponder it well!

Over the carpet the dear little feet
Came with a patter to climb on my seat,
Two merry eyes full of frolic and glee,
Under their lashes looked up into me;
Two little hands pressing soft on my face,
Drew me down close in a loving embrace;
Two rosy lips gave the answer so true:
"Good to love you, mamma; good to love you."

A GREAT NEED.

I WAS riding, a while ago, over a suburban road, along which were pleasure-grounds, etc., apparently much resorted to by the people of the city. I was struck by the large number of public houses and the various attractions used to secure the patronage of the traveler or pleasure seeker, and I could easily imagine—as the hot sun blazed down in a relentless glare that shriveled the leaves and dried up the dew-drops, and the dusty highway stretched out a long, white, dreary level—how very enticing to a poor, heated, tired mortal some of those wayside inns must be.

Cool, shady piazza, with glimpses through open doors of pleasant vistas beyond; woodbine and climbing roses, in gracefully festooned masses and the sign-boards painted in every device that could lure the fancy and charm the imaginative youth. Alas, that the road to ruin should have so inviting an entrance! For, charming and beautiful as the exterior may be, the same drink is sold that ruins soul and body in these palaces as in the lowest groggery. Of the two places above mentioned, the former are immeasurably the more harmful, for many a boy and man who would on no consideration patronize a "saloon" will unhesitatingly enter one of these resorts, and, like modern Esaus, swayed by the influences which *will* work so powerfully on human nature, sell their birthright—an honorable, useful life, vigor of health and intellect—for what is infinitely worse than a mess of pottage. Humanity is weak, and extremely liable to be influenced in an unguarded moment; moreover, weariness, hunger and thirst are weaknesses that must hold us all in more or less bondage while we are in these tabernacles, so let us have places of wayside entertainment for man and beast, and plenty of them, but let them *not* be of such a character as shall transform man into beast; let the white banner of Temperance rise over them all, and let its spotless folds float triumphantly in a breeze that shall bear upon it no fumes of alcohol.

The Woman's Temperance Union is doing a grand work. Cannot the other temperance organizations, of which there are now so many, lend a helping hand? There should be more suburban temperance hotels.

Now, somebody will say they could not be supported. I think they can, provided they try as hard as their opponents to secure support and patronage; the harmlessness of the dove is a very good and indispensable qualification for this work, but a little of the wisdom of the serpent would not come amiss; now, for instance, since so much depends upon outside attractions, especially in extremely hot, or excessively cold, or stormy weather, why not take a hint from the enemies of the cause? Have they irresistibly attractive signs? Let us have the signs of our temperance houses tenfold more so. Let us have, for the heated term, pictured icebergs and fountains, whose falling spray shall almost cheat the sunbeams; let us have (blushing and glowing) upon our sign-boards, fruits and flowers that shall tempt the very birds and bees; golden glaciers of ice-cream, and foaming glasses of soda. Honeysuckle, lvies, and climbing roses, how willingly will they lend *us* their aid to make our inn a place of delight for the lover of the beautiful! So, with all these, with rooms cool and airy in Summer, and cozily warm in Winter—for the cold winds and snow-storms will come, and we must be prepared for them also with glowing fires, and the various comforts which warm and cheer, and leave no sting behind.

I think success should and would smile upon our efforts.

Now, if some good temperance reformers, with the requisite energy and executive ability, would take hold of this work with a will, there would be a grand and visible advance of the temperance reformation. There is, by far, too much talk, and too little, real hand-to-hand work; those who cannot lecture, and organize societies, need not feel that they are therefore to be excused; there is a work for every one; let us each do our part, earnestly, faithfully, prayerfully, "for God, and home, and native land." ERMENGARDE.

New York.

OPEN LETTER.

DEAR MISS CLARK:—Will you kindly allow me, through the columns of the RURAL, to reply to several ladies at once, who have written to me publicly as well as privately? Much as I would desire it, time and energy would fail me were I to attempt to answer every one personally.

First, the lady in Alabama, whom I have neglected shamefully. She sent me some Florida moss and two beautiful pods (or what is the right name?) of cotton in its natural state. I was delighted with the gift, it seemed so thoughtful of her to send to a Northern woman specimens of Southern products, very seldom seen in this region. I really intended to write and thank her, but I blush to say that I never did so. Still, if she knew how much I had to do, I am sure she would excuse me. This lady, by the way, gave me the first kind, encouraging words that I ever received from RURAL readers. I shall always keep and appreciate her beautiful letter. If she would like to tell me of her success in drawing, I should be glad to know.

Next, the lady who asked for a specimen of my needle-work. I have not forgotten her, but I have done so little lately that I have had nothing suitable to send. In a short time I am going to do, as the children say, "piles" of embroidery—and then, I will remember my neglected correspondent.

Now the lady who asked for a catalogue of engravings. I was able to obtain a list of heliotypes but, so far, I have learned nothing of any particular catalogue of steel plates. I could write out one, if I took time enough, consisting of pictures familiar to me, but I think our friend would find more satisfaction in writing to Earle & Co., No. 816 Chestnut St., Phila. They will give her all the information she needs upon the subject of engravings, photographs, oil paintings, decorated articles of all kinds, as well as every variety of picture-frames.

Lastly, the lady who writes in the RURAL for July 31. I think I know exactly how she feels, and venture to say that she is making encouraging progress, otherwise she could scarcely have come to the difficulties indicated by her letter.

As to the lines in engravings being fine and delicate, I would say, it is not necessary to copy *every* line in a picture, though for a beginner this is the safest way, unless the design be *too* complicated. Aim for the *general effect*, keep the proportion of objects, reproduce light for light, and shade for shade.

Patterns and natural flowers are both useful. Patterns have the advantage of keeping their shape and position, while natural flowers change faster than one can copy them. But don't depend upon the former to the exclusion of the latter. In fact, discard the former altogether, as soon as you can safely depend upon the latter. Constant Reader was exceedingly unfortunate in her selection of a daisy, as, next to a rose, it is about the most difficult flower known to an artist. Buttercups, pansies, hollyhocks, and, indeed, almost any single flowers, are much better for not only an amateur, but an experienced draughtsman. She might, however, in ordering flower patterns, ask particularly for one containing a daisy—*then*, after copying it, she would better understand how to draw one from nature. But, after all, drawing can only be learned by practice—it cannot really be taught. MARGARET B. HARVEY.

YOUR FUTURE HOME.

IT used to be the custom of thrifty New England girls, and those in other sections, to begin very early to accumulate stock toward the "setting out" in that new home all expected some time to have.

It was a common topic of conversation among mothers; they compared notes with maternal pride concerning the number of bed-quilts little Jane had pieced, and the stockings Eliza had knit.

Just as early as it could be done, the six little silver teaspoons were bought and marked, and lucky indeed was the little girl to whom grandma handed down her best feather-bed and all its belongings.

I have heard my father tell of an old lady who said she would not think much of a girl who would consider her outfit complete without a pillow-case full of stockings of her own knitting. If that was the law now about a wedding outfit I think the country would fill up with old maids.

Manners and customs change with the times, but it is still true that young girls begin very early to lay the foundations of their future homes. It depends more upon what a woman is than upon what she has whether her home will be one of prosperity and happiness or the reverse. The habits and temper which the little girl adopts are very sure to follow her on through life; they are parts of her "setting out."

Better than rosy quilts of most intricate devices is a sweet disposition in the housekeeper. No treasures of silver or embroidered tapestry can make a home delightful where this is absent. If sharp words ring through the halls and echo from room to room one may well sigh for "a corner of a housetop alone."

I do not know of one thing besides intemperance that can make a home more thoroughly wretched than a scolding house-mother. It is an easy habit to take up; there is enough to try the patience and provoke the hasty speech almost every day. There is but one way of safety. The iron hand of self-restraint must be brought to bear upon the spirit, and the earlier it is commenced the easier the task.

People sometimes change greatly in mature years, but it is very seldom.

Think of it, girls, seriously while you are at home under father's roof, and ask yourselves this question: "Do I want to be known as a scolding woman when I grow up and have a home of my own?" Cultivate loving, gentle speech among your brothers and sisters. Keep back the hasty words; learn to forgive, and return soft answers to hard speeches.

It will never give you a moment's pain to do so, but will save you many bitters tears, and make you a blessing to others.

With this rare jewel you have in your hand an Alladin's lamp that can make beautiful the plainest rooms in your future dwelling. Without it you would be poor in a queen's palace. J. E. M.

WORLDLY MATTERS FOR GIRLS.

Color.

THIS article is mainly to assist in the selection of the ribbons and bits of color with which a girl loves to brighten up the more sober groundwork of her dress.

The fundamental rules of color are, blue and pink for blondes, red and yellow for brunettes; but there are exceptions to the rules, for instance blondes of the "strawberry" type should never wear pink, but they are not necessarily confined to blue. The new shades of heliotrope are becoming to nearly all, and green to most light complexioned people, pale green (never use a pronounced shade of this color) is particularly adapted to persons having a little color, it brings out a slight flush. Those having a great deal of color can wear pink, it has an opposite effect, and tones down the complexion.

There are, of course, other colors to choose from and I think that nothing is more suitable than black velvet, it makes the richest contrast to light hair and complexion, that can be found.

Brunettes with clear olive complexions can wear pink and blue, also deep orange and pale lavender. Corn color and dark cardinal are suitable for the darkest brunettes, pale cream is also a very desirable shade for this type.

For those who are neither extreme (and they are the majority) there is a great latitude of choice, but care should be taken especially in the use of pink, it generally gives a yellowish cast to a skin which would otherwise be clear.

Try a color before purchasing, by holding it against the face, and avoid those which seem to deaden the eyes and hair. MISS M. D.

THINGS TO BE THANKFUL FOR.

"Oh!" exclaimed a lady, who had just been conducted through a public building where the old, infirm, deformed and helpless inmates were supported by public charity; "if people could ever learn from others' experience how it would cure the discontent of many grumblers, to go through a place like this, I should think they would come out thanking God for the power of supporting themselves by hard work, and for the privilege of giving to the support of those, so much worse off than themselves." Should not a mother especially be grateful for the gift of sound, healthy children, perfect in the possession of their mental and bodily faculties?

Although the care of them is often wearisome, acting as a constant strain, both of the body and mind, yet how much more comfort there is in such labor of love, than in that where tender pity is the strongest feeling called into exercise. At the sight of such little deformed ones, we feel that we hardly realize our every-day blessings, and are not sufficiently grateful for them. B. C. D.

FOR MISS IRENE.

DEAR RURAL,—Permit me to say a few words in reply to Miss Irene of Fairfax Co., Va. I most certainly agree with her in her article on "Woman's Work;" she deserves credit for the vigorous use of her pen for general information to her RURAL sisters. I am a reader of the RURAL and ask that she will please not think that all of the farmers are the kind she speaks of. Delaware has some of the best farmers in the United States and they are not the kind Miss Irene speaks of.

She had better come to Delaware before she enters the matrimonial state. The Delaware women are not working themselves under the coffin-lid.

Delaware. DR. A. E. S.

WOMEN IN RELIGION.

E. L. T.

IN the New York Sunday Sun of July 4th appears a letter from a Michigan lady of atheistic opinions, in which the writer tries to prove that the higher education of women causes them to reject not only the traditions of the Church, but Christianity itself, and that their emancipation from its "bondage" is of advantage to them intellectually.

She thinks the way of the Church is to treat women as fools or children, over whom it can establish an intellectual domain to which men (accustomed to more freedom) refuse to submit.

She thinks higher education is teaching women that "it is to the unscientific doctrine of the church concerning their inferiority and natural depravity that they are indebted for their inferior position," and she believes that women should take the higher mathematics as a substitute for Christianity.

Think of that, sisters, substitute for the doctrine of "Peace on earth, good will to men," differential calculus, and for universal brotherhood and equality, geometry and surveying!

It is true, the Church formerly imposed great restrictions on women, but was it not an outgrowth of paganism?

After the Reformation—which was an endeavor to produce a purer form of Christianity—the condition of women was greatly improved. It is true, many modern, learned women have rejected part of the Scripture traditions, but to me that seems from lack of faith, and wish to look upon divine events from an entirely materialistic standpoint.

If women would only look upon scientific matters in a scientific light and spiritual matters in a spiritual light, they would not confuse their science with their theology.

FASHIONS.

Chemisettes are again in fashion.

Low shoes are worn a great deal to show the colors and embroideries on stockings.

Little girls wear their hair loose and flowing down the back, not braided or curled.

Rich and substantial fabrics are necessary when plain and untrimmed suits are preferred.

The new gold threads introduced into laces and embroideries are not tarnished by washing.

The favorite colors for figured lawn dresses are heliotrope, pale blue, pale rose and old gold.

Fancy ornaments, such as gold pins, daggers and arrows, are worn in the hair for evening.

When imitation pearl beads are used for embroideries they should be very fine to look real.

New lisle-thread gloves are in all the new shades of almond, drab, biscuit, gray and wood colors.

Black, white, and cream-tinted Surah silks are all used as linings, as well as the brighter colors.

Fashionable stockings are embroidered in rosebuds, forget-me-nots, buttercups and polka dots.

Almost every fashionable toilet has some hint of the rage for the bright and clever notions of the Japanese.

Foulard handkerchiefs are trimmed with Breton and Languedoc laces, and made into bows, jabots and fichus.

Japanese white straw hats are trimmed with white lilacs and bows of white satin ribbon for children's wear.

Quantities of gold lace, gold net, gold braids, galloons and cords are seen on summer bonnets and dressy hats.

Turbans, Fanchons, Derbies, Japanese Fayal and rough-and-ready, broad-brimmed hats are equally fashionable.

The strings of small bonnets are more frequently tied in a bow in the back over the chignon than under the chin in front.

When a floral tablier is worn the coiffure and corsage bouquet flowers must correspond with those sown on the tablier.

Yellow lace is much used for trimming dresses and jackets. It is sometimes worked with colored threads to match the dress.

Carnation stalk is a new tint of green that only blonds can wear, and is intended to console them for not being able to dress in yellow.

Breton lace is used in preference to Languedoc for trimming evening toilets of mull, crape, and even silk, its close and delicate patterns being more admired than the rambling designs of the Languedoc.

Shirring is more used than at any previous season for the front of dress skirts, but is now shirred horizontally, in wide clusters, instead of lengthwise, as it was formerly.

A pretty new style of cap is composed of a cream or colored silk handkerchief, edged with a dark fancy band, arranged with the points to the front, back and sides, mounted on a wire band, the center being puffed to form the crown. The hair must be worn a little high with it to render it becoming.

ABOUT WOMEN.

Two Japanese young ladies from Vassar College attract much attention at Saratoga.

THE Empress Eugenie has passed a night on the spot where her son was slain, and supported the trial better than could have been expected.

MISS FRANCES COLENZO, daughter of the Bishop, has written a book on the Zulus, and presents Cetywayo as a peace-loving and magnanimous ruler.

MISS SIDNEY PAUL GILL, the author of "I Want to be an Angel," has died at Newark, N. J., at the age of sixty years. She was born at Birmingham, England.

THE Princess Louise, wife of Lord Lorne, Governor-General of Canada, has adorned with her own hands the panels of a white door in her boudoir, by painting thereon the branch of an apple tree in leaf and fruit, so artistically that it is said the apples "are ripe and rosy enough to cause a second fall."

A NEW songstress has appeared in London. Theatrically she is known as Mademoiselle Nevada, or the Nightingale of the Sagebrush. This successful singer is Miss Emma Corriane Wixom, of Austin, Nevada, who after some tuition at home has been trained to additional excellence in Vienna, where she has appeared in opera.

THE Mrs. Wodehouse who was married at the British Embassy a few day ago to the Marquis of Anglesea, will be recalled as Miss King, of Georgia, who, ten years ago, was prominent in fashionable society in Washington during the season. In 1872 she married the Hon. Henry Wodehouse, brother of the Earl of Kimberly, who died in 1873. She is a perfect type of a Southern beauty.

A MIDDLE-AGED American woman is rejoicing that it has at last been settled by both the eclectic and historic societies of that Western State that the world generally may be permitted in the future to say Ar-kan-saw! A quarter of a century ago all Western men pronounced the word broadly, with a heavy emphasis on the last syllable, making it sound "very much Indian," and there seems to be no good reason for mincing the vigorous and resonant name after the broken accents of the French travelers, who, with the inherent self-sufficiency of their nation, first assume a sovereign right to mispronounce any word, and then spell the mispronounced syllables according to the dictates of their own fancy.

HINTS.

A SPOONFUL of stewed tomatoes in the gravy of either roasted or fried meats is an advantage.

LEMONS.—To keep lemons fresh, place them in a jar filled with water, to be renewed every day or two.

HOUSEKEEPERS may be glad to know that a tablespoonful of ammonia in one gallon of warm water will restore the color of carpets.

TO REMOVE grease from wall paper, lay several folds of blotting paper on the spot and hold a hot iron near it until the grease is absorbed.

PUT one or two red peppers, or a few pieces of charcoal, into a pot where ham, cabbage, etc., is boiling, and the house will not be filled with the offensive odor.

THOSE who object to tea-leaves for sweeping the carpets can use freshly-cut grass instead. It answers the same purpose for preventing dust, and gives the carpet a fresh, bright look.

SICK-HEADACHE can often be greatly relieved, and sometimes entirely cured by the application of a mustard plaster at the base of the neck. The plaster should not be kept on more than a quarter of an hour.

IF you want good starch, mix it with cold water; add boiling water until it thickens, then add a dessert-spoonful of sugar and a small piece of butter. This makes a stiff and glossy finish equal to that of the laundry.

FOR a damp closet or cupboard, which is liable to cause mildew, place in it a saucer full of quick-lime, and it will not only absorb all apparent dampness, but sweeten and disinfect the place. Renew the lime once a fortnight or as often as it becomes slaked.

A GOOD way to keep cut flowers fresh is to lay them in wet cloths. Take them out of the vases at night, sprinkle with cold water, and wrap them with cloth made very wet. The weight of the cloth will not crush the most delicate flowers, while it keeps out the air and prevents their falling to pieces or opening further.

ICED TEA is a nice as well as a fashionable drink for Summer meals, but it is not so generally understood that the best iced tea is not steeped in hot water. Just try "steeping" it for a few hours in cold water, using a little more tea than for the hot beverage, and having it strong enough to be weakened with ice water when it is served. The flavor and effect are much better than by the hot-water method. And, by the way, the same plan is coming to be more recognized as the best for the preparation of the herb teas used for medical purposes, especially such as throughwort (boneset) and others, which, steeped in hot water, produces an unpleasant and undesirable nausea. This effect is obviated by steeping in cold water, and the tea can be made much stronger, and used to better advantage.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

HOW TO LIVE IN SUMMER.

WE have received a pamphlet of 30 pages, called "How to Live in Summer," by Mrs. Amelia Lewis, former editress of the National Food and Fuel Reformer, London, England. It is published by the American News Company, of New York, price 10 cents. From it we extract the following: The operation we call roasting meat should never be carried on in hot ovens without covering. All boiling operations should be carried on by a steaming process. The broiling process has no reasonable basis; by it the meat is never thoroughly done, and when it is done it is burnt up and it has lost its finest juices.—Bacon is not the best dish for Summer breakfasts.—No boiling up of old coffee will ever make anything like a good cup.—Tea should be placed in a heated pot (silver, china or granite ironware), some warm water just sprinkled over it and after standing three or four minutes, the boiling water be poured on.—Many diseases that follow on Summer and are the curse of our Autumns are entirely brought about by carelessness in living.—Soups are by no means to be despised in Summer, but they must be *fresh soups*.—That evil stockpot of which ladies and cooks are so fond, is an article which should never be allowed in a kitchen where health is studied.—Fish of all kinds is an excellent food for Summer.—Fish pies covered with suet crust make a good meal. Suet crust is lighter than lard crust, but the suet must be chopped very fine and the crust be made of warm water.—Fish cooking should be encouraged in every way. Ladies and cooks should never think that they have come to the end of their inventive power when they have boiled or fried fish.—Roast beef should come seldom on the table in Summer.—There is no doubt that clear, fresh soups, made overnight, thickened with a little rice and sago, and warmed up the next morning, might give to many a delicate constitution more vigor for the day than either tea, coffee or milk, for the latter is not easily digestible for all adults.

For the workman there is not a more nourishing dish than

Brown Onion Stew.

Take some fine chopped suet and melt in a saucepan, add a good many onions cut right across, and partially brown them, sprinkle a little flour over them and stir well, adding warm water to make gravy. Put in pepper and salt, and whatever pieces of meat, cut in strips, with a little kidney or liver, you require, or brown these also with the onions; let simmer about ten minutes or so, and then place carefully well-peeled potatoes on the top. This stew must gently simmer till done and not be stirred about, so that the potatoes come out whole. A few spoonsful of catchup to be added some minutes before serving. It is light of digestion and very nourishing for Summer.

Steak Pudding.

This is also a digestible, nourishing dish for work-people. Make crust of fine-chopped suet, flour and warm water; place round basin; cut pieces of steak, with some liver or kidney in strips, and put in with some fine-chopped onion, pepper, salt and a little mace; moisten with some warm water and close up with crust. If you have no steamer; place a trivet in the bottom of the saucepan and put basin on it, so that the steam from the boiling water below cooks the pudding. When well done, which you will know by the knife coming clear from the crust, take out, place on a dish, broadside down, and open top a little. Put in a small piece of butter and a couple of spoonsful of catchup, and a beautiful gravy will run out round the dish.

Steamed Lemon Pudding

suits Summer weather. Crumb stale bread, add one or two spoonsful of fine flour, put to it very fine chopped beef suet, brown sugar, the juice of two or three lemons, well strained, and the finely chopped peel of one or two, also a few pounded sweet almonds, if desired. Beat up the yelks of three or four eggs well, and the whites of two, with white sugar; when the dry substances have been well mixed add the eggs and a little warm milk. Mix well and place in a buttered shape for steaming. If there is no steamer, place it on a trivet in saucepan. When done pour over it sweet white sauce with vanilla flavoring.

A few sponge cakes, first soaked in milk or some sherry wine, with jelly or jam put over them, and a nicely boiled custard poured over it, make a refreshing pudding. Plain, light suet puddings, with fruit, and steamed, are to be recommended; also stewed fruits of all kinds; fritters with different flavors, particularly the orange; light open tarts, with fruit on top, but *not* covered by crust; omelettes with fruit, and all sweet dishes that recommend themselves to our good sense as easily digestible, nourishing and not overheating.

HOUSEHOLD HELPS.

Farmerine.

KEEP your temper, though the situation be trying.

A nice way to cook new potatoes in the skin is to steam them instead of boiling. Put them in a steamer over a pot of boiling water; it takes longer than to boil, but they are always mealy.

Commence to grate a nutmeg at the stem end.

Learn something new every day.

Put salt in the water in which eggs are poached.

A pretty house plant is a lemon tree, easily grown from seed, and some of the leaves can be used for flavoring. A few tied in a cloth and dropped in apples (for sance) while cooking impart a pleasant flavor.

Be cheerful; it is good for yourself as well as others.

Sixteen large tablespoonsful are one pint.

Use aqua ammonia for the stings of bees.

Now is the time for gathering ferns to press, oats, many kinds of grasses, and "treasures of the wild-wood," all of which are useful for decorating our homes when chilly Winter comes.

Forty drops are equal to one spoonful, and four teaspoonsful are equal to one tablespoonful.

Occasionally do some pretty piece of fancy-work.

Dipper gourds make excellent things to keep salt in for kitchen use. Cut a hole in the side large enough to admit the hand and to remove the seed; also cut a small hole in the handle to hang up by.

Strain meat fryings through a thin cloth; keep in a cool place, and you have a cheap shortening for "every-day" pastry.

Keep a blank book with a thick cover in the kitchen, and copy any bits of information that may likely be of use at some time. Be sure and write in a large, clear hand.

Take a day and your family into the "heart of the wild-wood," and picnic in the old-time way, and you may be sure the day cannot be counted *lost*.

Peeling Peaches with Lye.

I have used lye for removing skins from peaches for canning or drying purposes, and think it better than peeling with a knife. It is not only a quicker process but a better one, leaving the fruit perfectly smooth, and especially nice for preserving whole. Fill an iron kettle with water; place over the fire; put in a piece of concentrated lye and let it dissolve until strong enough to cut the skins—you can tell of its strength by dropping in two or three peaches—then take out and put in your fruit. Home-made lye is as good as concentrated, but not having any ashes, I bought the concentrated article.. The fruit must not remain in longer than is necessary to cut the skins. A wire basket is the best thing I have found for dipping them in and taking out. Plunge at once into a tub of cold water, rinse thoroughly, and wipe the skins off with a cloth.

MRS. M. L. K.

QUESTIONS ANSWERED.

Tapioca Pudding.

N. asks for directions for making the above.

ANS.—Wash a cupful of tapioca and let soak several hours in a pint of milk; then add another pint of milk, the beaten yelks of four eggs, a cup of sugar, half a cup of butter, cinnamon, nutmeg or the grated rind of a lemon, a little salt, and, last, the beaten whites. Pour into a buttered dish and bake from three-fourths of an hour to an hour.

We have found

Tapioca Farina

a very nice dish. The farina tapioca comes quite finely ground. Stir a teacupful or a little more of this into a quart of boiling milk and boil gently until it thickens. Eaten with a flavored sweetened cream.

Cucumbers in Brine.

Oliver Jenness asks for the best way to keep cucumbers for pickling when one does not care to put them into vinegar at once.

ANS.—Cut off the cucumbers, leaving a short piece of the stem on, carefully placing them in a basket without bruising, wash in cold water and lay in a cask two or three inches deep; cover with salt—the coarse quality—and repeat until all are in. It will be necessary to throw in a little water with the first layer, afterward the salt and liquid from the cucumbers will make sufficient brine. Spread a cloth over them; have fitted a board that will go inside of the cask, keeping all the cucumbers under, and place a heavy stone on top. When fresh cucumbers are to be added, remove the board and cloth, washing off from them and the sides of the cask every particle of white scum. Any of the top ones that seem soft throw away. Put in the fresh cucumbers layer by layer, with salt between, as at first. When the cask is almost full strew over salt, cover perfectly with cloth and replace board and weight. The cucumbers must every one be kept under the liquid. Look after them, washing off, from time to time, the scum that covers cloth, board and weight. To insure success the cucumbers should not be bruised, and they should be put into the cask soon after gathering. When wanted for use, take out as many as you wish, replacing the cloth, board and weight. Put the cucumbers into a vessel that is large enough to hold two or three times as much water as there are pickles. Cover with cold water, let stand three or four days, or until fresh enough, changing the water each day. Then cover with hot, spiced vinegar.

Fruit Cans.

J. Welfou will find a responsible wholesale dealer by applying to Geo. F. Bassett & Co., 49 Barclay Street, New York.

Felon Cure—A Correction.

The receipe given in the RURAL of June 19th, page 399, should read hard soap, salt and turpentine instead of lard, etc. I think the lard would neutralize the effects of the turpentine.

MRS. W. C. GIFFERD.

News of the Week.

HOME NEWS.

MAX BURCKHARDT, editor and proprietor of the Humorist, a German weekly published in San Francisco, committed suicide recently by taking morphine. The cause of the act is unknown. He was a native of Berlin, and about 50 years of age. .....S. W. Hoffman, ex-Auditor of Cincinnati, Ohio, was arrested on the 1st inst., on the affidavit of Julius Dexter, of the Sinking Fund Commission, charging Hoffman with the misappropriation of two Cincinnati bonds of 1,000 each while City Auditor. Bail was fixed at $5,000.....On the 1st inst., a large balloon that was used for short aerial excursions at Youngstown, Ohio, broke loose from its moorings and went skyward with a man and woman in its basket. The balloon rose to a great hight, then drifted in a northeasterly direction and disappeared from view.....Railway enterprises to the number of 287, and covering a contemplated mileage of over 20,000 miles, have been reported to our notice during the past six months, as either in process of construction or projected, in 33 States and Territories. Certainly these figures are very encouraging to all whose business is in any way connected with railway building or operation, as they show the great activity in the business.....The very latest expedient for getting rid of the Chinese in California is to tax the six companies out of existence..... Visitors at Niagara Falls find hackmen, hotel proprietors, and shop-keepers at that place as aggressive this year as usual; for some reason there are but few visitors, however. Nobody has gone over the Falls yet this year, but several persons have toppled over precipices by accident or otherwise. It is a popular place for suicides..... The Rev. Mr. Adams, of Dunkirk, N. Y., has been suspended from the Presbyterian Church for heresy. His offence consisted in that he announced in a sermon that he could not believe in eternal punishment.....The Public Printer having refused to allow the employes under him pay for the Fourth of July, a committee of printers paid a visit to First Controller Lawrence, of the Treasury, to get a decision from him regarding the legality of the withholding of pay for public holidays. Judge Lawrence informed the committee that he was not at that time ready to make a final decision, but would hold the case under advisement. The Judge decided the 3d inst. that the employes are entitled to receive pay for public holidays. This decision is of interest, as it may be taken as a precedent for similar cases....

UTES SIGNING THE TREATY.

A special dispatch from Los Pinos, under date of August 2d, says: "Indians were struggling into the Commissioners' quarters all day yesterday to sign the treaty. The chiefs having signed the agreement, the others were fearful that unless their names were forwarded to Washington they would receive no part of the $60,000 which the Commission is authorized to pay out as soon as arrangements for the removal of the Utes are perfected, which will probably be some time next Fall. The Commissioners will probably leave here about the 4th inst. for the South Ute agency, except Col. Meacham, who will remain at Los Pinos to take the census. The removal of the Utes is only a question of time, and the Commissioners are hurrying matters as fast as possible. A year from this Fall will probably see the reservation open to settlement."

The new iron bridge across the Red River, on the St. Louis, Iron Mountain and Southern Railway, is completed, and trains will now cross. Its length is 788 feet between the abutments. There is a draw span 300 feet in length, a fixed span of 312 feet, and two fixed spans of 88 feet each. The bridge is a first-class one in every respect.

THE ALABAMA ELECTION.

The election held in Alabama on the 2d inst., was for a full ticket of State and county officers. An immense vote was brought out. As in a great many Democratic counties there were no nominations, each candidate brought votes to the Democratic State ticket. The Republicans had no ticket in the field, and supported the Greenback ticket, though there was no regular organization throughout the State. The vote for that ticket will be very small. The returns so far received show large gains for the Democrats in the counties of the Congressional district now represented by Mr. Lowe. Mr. Lowe's district is the Eighth, and consists of the counties of Colbert, Franklin, Jackson, Lauderdale, Lawrence, Limestone, Madison, and Morgan. The Democratic majority will not be less than 30,000, and returns indicate a larger majority than that if the same ratio is kept up by the other counties. Returns from Mobile county show a clean sweep for the Democrats against the Republicans and Greenbackers. The lowest candidate on the Democratic ticket will have 1,000 majority. Special dispatches say that Tuscaloosa, Perry, Dallas, Bullock, Macon, and Montgomery counties have gone heavily Democratic. The returns from Madison, Limestone, and Morgan Counties are also highly favorable to the Democratic ticket.

The election in Utah resulted in the liberals carrying a part of their ticket in two counties..... Out of 18 judicial districts in Kentucky, the democrats have just carried 15.....The opinion generally prevalent that the South would lose some eight to ten Congressmen by the new apportionment resulting from the new census, does not seem to be borne out by the preliminary returns. A part of the present representation may be transferred from the eastern to the western of the southern States, as will a portion of the eastern northern States to the western.

The female popula ion figures prominently in the census returns of Colorado, the youngest in the sisterhood of States, and ranges all the way from more than a third, in a comparatively aged town like Denver, to 3794 among Leadville's 15,183 people and 686 to the 4674 in the newer mining town, Silver Cliff.....One great trouble with Edison's electric light has been to get an engine that would run the dynamo-electric machine fast and steady enough. The Southwark iron foundry at Philadelphia is now trying to see what it can do, and proposes to turn out a 100 horse-power engine that will make 600 revolutions to the minute.....The most disastrous fire which has visited Buffalo, N. Y., for some years broke out in Dewitt's planing-mill last week and swept over an area a quarter of a mile long and about 500 feet broad; loss $225,000, insurance $185,000.....The census office says that the total population of the United States will be a little over 49,000,000. The official count will be needed to determine whether Ohio or Illinois is the third state of the Union in population..... .....Fifteen disguised white men went to the house of Joe Thompson, a colored man, 20 miles from Atlanta, Ga, last week, dragged him out, beat him and his wife fearfully, fatally shot his son, and killed his daughter. There is great indignation throughout the county, and a citizens' meeting at Jonesboro denounced the killing and offered $500 reward for the murderers. The State authorities are also determined that the murders shall be properly avenged. Gov. Colquitt and the Gate City Guards of Atlanta have taken the seven prisoners arrested from Jonesboro to Atlanta for safe keeping, and other arrests are expected to follow. John Gray, the leader of the gang had recently been prosecuted by Thompson, and been convicted of assault and battery..... Information comes from Texas that what is known as the Grand Army of Occupation organization, whose object is the invasion of Mexico under General Dalrymple, is assuming considerable proportions. Three hundred men are enrolled in Austin and vicinity, and the first regiment of Texas cavalry, of which Col. Armstrong, of Austin, is commanding officer, has 300 members and recruiting is going on. General F. W. James, who is general of Texas militia, has been given command of the department, embracing Texas, New Mexico, Arizona and California. He has appointed his staff, and consultations have been held, but the results have not yet transpired. The movement is attracting a good deal of attention, and the belief is expressed that if the government does not interfere serious trouble will result..... At Tyro, in Davidson county, Va., a few nights ago, Uriah Phelps ejected some negroes from his store. Anticipating further difficulty, he secured the services of O. W. Chick, a young man addicted to sleep-walking. The men watched in the store half the night and then fell asleep. Subsequently Chick got up and cut off Phelps' head with an ax. Chick was arrested. He claimed he knew nothing of the deed till some time after it was committed. Chick's habit of sleep-walking and the friendly relations of the two men turn public opinion in his favor..... ...The earnings of the Chicago and Northwestern Railroad for July show an increase of $390,000.....The Illinois Secretary of State has licensed the Metropolitan Elevated Railway of Chicago. It has a capital of $5,000,000..... On the 6th inst. the Italian wife murderer, Balbo, paid the penalty of the crime with his life. Strenuous efforts had been made to induce Governor Cornell to commute the sentence, but he declared that he was unable to justify himself in any interference with the execution of the law. Balbo was hanged in the Tombs, New York city, early in the day... ....Secretary Evarts has been notified that an American missionary named Harris has been murdered by the Turks near Constantinople. The government promises reparation. The slayers of Dr. Parsons and his two servants, murdered near Ismid the other day, have been arrested. They are nomad Turks, and have confessed.....

THE NOTORIOUS BENDER FAMILY.

Two tramps, an old man and woman, supposed to be the notorious John Bender and wife, who committed the wholesale murders on the Bender farm in Labette county, Kansas, in 1872 and 1873, were arrested at Fremont, Nebraska, on the 29th ult., since which time an effort has been made to prove the character of the parties, and has resulted in the general belief that the notorious outlaws are at last in custody. They call themselves McGregor and have been living among the Sioux Indians for a year or more. The woman is six feet in hight and very stout, weighing over 200 pounds. Bender is also a man of very large frame. Reporters and officials have succeeded in getting very complete confessions from the two that they are the identical Benders concerned in the various murders, and they were on the 7th instant taken to Kansas by the Sheriff and assistants. It was reported that young John and Kate Bender were somewhere in the neighborhood of Omaha, but they have not been found.

Elizabeth Monahan, of Seabright, N. J., died on the 7th, from the effects of a druggist's mistake in putting up a solution of morphine instead of Epsom salts.....The completion of the Washington monument at Washington was began on the 7th.

The annual rate of mortality, according to the most recent weekly returns, in Calcutta was 18; Bombay, 31; Madras, 31; Paris, 26. Geneva, 21; Brussels, 24; Amsterdam, 20; Rotterdam, 24; the Hague, 15; Copenhagen, 25; Stockholm, 24; Christiania, 19; St. Petersburg, 48; Berlin, 38; Hamburg, 23; Dresden, 18; Breslau, 31; Munich, 33; Vienna, 27; Buda-Pesth, 41; Venice, 24; Alexandria, 40; New York, 24; Brooklyn, 17; Philadelphia, 17; and Baltimore, 28. Small-pox caused 48, measles, 39, and typhoid fever 20 deaths in Paris. .....Bradford, Penn., July 28.—Dr. A. G. Hopkins was to-night held for trial on the charge of involuntary manslaughter in carlessly prescribing morphia—instead of calomel—from the effects of which Mr. A. McCarroll, his patient, died on Saturday... ....Danville, Va., July 28.—In Patrick County, last Friday, Pink De Hart met Amos Woolvine on horseback, with Mrs. Hart behind him. An altercation ensued between the men, ending by De Hart shooting Woolvine with a revolver through the forehead and neck, killing him instantly. De Hart then went to Patrick Courthouse and surrendered himself. He suspected that improper relations existed between his wife and Woolvine.

FOREIGN.

The dispute between Turkey and Greece and Montenegro remains in *statu quo*, with the probability growing stronger that Montenegro will be placated by the cession of Duligno, instead of a part of Albania, which it would be hard to hand over in the teeth of its brave inhabitants, and still harder to retain. The Powers seem to "weaken" a trifle on their demand of territory to be ceded to Greece. The fact is that while they are anxious that their wishes should be obeyed, neither of them is willing to begin hostilities to enforce obedience, as no one knows where the war would end, once begun. Moreover, the illness of Mr. Gladstone, which has been severe though nearly over, has somewhat retarded measures, for he is the greatest philohellenist in Europe. Then again, the trouble out in Afghanistan, menacing the security of the British Empire of India, makes Englishmen regard the interests of Greece, just now, as mere trifles. It is not unlikely, therefore, that Greece will, for the present, have to rest content with a good deal less than she wants of her neighbor's property, in the belief that when the "sick man" dies, she will get a proportionately larger slice of his land than she might otherwise obtain....In South America the war between Chili and Peru still drags its slow and cruel length along. In Lima there is an ugly report that some Peruvians entered Mosquequa, where the victorious Chilians had left their wounded in care of the natives, and murdered every one of them. It is also said the Chilians have sent a force to wreak a terrible vengeance. In Callao Bay a Chilian transport has been sunk by a Peruvian torpedo with a loss of about 150 men out of less than 200.....

In England, just as predicted here last week, the Compensation for Disturbances bill has been overwhelmingly defeated in the House of Lords, quite a large number of Liberal lords having opposed its passage as vigorously as the whole body of the Conservatives. In Ireland, where now the relaxing grip of the landlord is again thus tightened on the tenant, the discontent is loud and deep. The Government has already sent 1,000 troops from England into the most discontented districts, and more are held in readiness for embarkation, should any disturbances break out. Most likely an agitation will be started in favor of the abolition of the House of Lords, but it will be generations before that will take place. The late disaster in Afghanistan absorbs public attention just now, and re-inforcements are being pushed forward as rapidly as possible, 1,000 troops having already left Southampton for the scene of war. Gen. Stewart has left Cabool with his forces to relieve Candahar which is beset by Ayoob Khan, who has taken several small places on the British line of retreat or of succor. There is a good chance that a great deal more of the Afghans will join the victorious standard, but of course, almost like *our* Indian wars, the triumph of the white man is a mere question of time.

Sir Bartle Frere to whose mismanagement as Governor of England's South African dependencies the Zulu war and other troubles in that section have been widely attributed, has been recalled. The Conservatives and the Queen herself were strongly opposed to this step, but public opinion demanded it, and the government has been obliged to yield.....Gladstone's sickness has caused a great deal of anxiety throughout the world during the week, but he is now declared out of danger.....Servia and Bulgaria are reported to have formed an offensive and defensive treaty, in view of probable trouble between Turkey and her neighbors..... It is now stated positively, after having been as positively contradicted, that the Baroness Burdett-Coutts, the greatest living heiress and philanthropist, is about to marry Mr. Ashmead Bartlett, an American by birth, who has acted as her secretary and almoner for some years. By becoming his wife the Baroness will lose a large portion of her income—to the extent, it is said, of $500,000 a year, in accordance with the will of the Duchess of St. Albans, who left her a vast property on condition that if she married an alien or naturalized citizen, her interest in the Coutts Bank and other properties should cease. The Baroness is 66; Mr. Ashmead not yet 29.....In Italy the Clericals have gained great victories at the municipal elections at Florence and Rome, having returned 12 candidates out of 14 vacancies.....Russia is to have new flotillas of revenue cutters in the Baltic and Mediterranean, to be under the Minister of Finance in peace, but to belong to the Navy in war time.

In France the victory of the Republicans at the late election for Councils-General which, in turn, elect senators, has proved much greater than was expected from last week's advices—they have elected more than three times as many as their opponents combined. This gives a certainty of their success at the general elections next Summer. In Germany the unusually large tide of emigration to this country is causing no small uneasiness, as much of the bone and sinew of the country and, above all, of the "food for powder" is thereby lost. Bismarck is in temporary retirement for his health's sake, and all things are therefore quiet and uninteresting.

AGRICULTURAL NEWS.

Reese Owen, a Pittsburgh pork packer, has failed. Liabilities, $160,000.....The railroads are doing an enormous business in moving grain eastward. Yesterday week 1,500 car-loads of grain passed Poughkeepsie, N. Y., which is an unprecedented number for any one day.....The land question in California is summed up by a California paper in this way: There are about 100,000,000 acres of land in California. A little less than half of this area is unsurveyed, or about 45,000,000 acres. There is not much exceeding 4,000,000 acres under cultivation, although something more than 6,000,000 acres are inclosed with fences. There are 5,000,000 or 6,000,000 acres of land, more or less, which can be bought for from $1.25 per acre up to $7.....A shrewd farm hand bought for $160 the big meteor which fell in Emmet County, Iowa, last year, and was laughed at by his comrades for what they conceived to be his idiocy. He has now sold it to the British Museum for $6,500.....A miller at Poplar Bluff, Mo., was noted for never fulfilling a promise. No grist was ever ready on time. The other day an exasperated customer, who had come twenty miles to meet with the usual disappointment, fell upon him with a knife and killed him..... A Parliamentary return, just issued, of cases of eviction which have come under the knowledge of the constabulary in Ireland shows that during 1877, 406 families were evicted; in 1878, 834 families; and in 1879 there were 1,098. During the current year, up to June 20, there have been 1,063 families evicted. The aim of Mr. Forster's bill was to prevent further extermination. Hence landlords' opposition.....The tenants of an estate in Leinster have combined not to pay rent, but to postpone payment. On the landlord remonstrating with one of them, and pointing out the unpleasantness of their probable future relations, the man replied: "Well, yer know I can't pay yez the rent, but if you're anyways short, I'll lend you it. ..... The Russian newspapers report that much mischief is being done to the crops in southern Russia by locusts and other insect pests. In the district of Rasachs 5,000 men were daily employed in the work of extirpation. On the railway from Tiflis to Poti the locusts lay so thick on the line that the trains were obstructed. The steppes of the Don have been swept bare of all vegetation, as if a fire had passed over the land. Fourteen companies of soldiers are employed in the Odessa district in destroying these insect plagues. The mischief is not confined to the south; swarms of locusts have been observed also in the northern governments. A huge swarm passed by Moscow in the middle of June at an elevation of from 70 to 100 feet.....Sweet corn is canned in Circleville, O., at the rate of 750,000 cans per acre, at an establishment which has been several years in successoperation. They grow their own corn, sometimes planting 500 acres. Boston is their usual market. .....The French Ministry of Commerce has, for the first time published the statistics of the imports of cattle and pigs into France. The return applies to the first four months of 1880, and shows that 87,000 head of cattle, 575,000 sheep and 95,000 pigs were imported. Of these, only 131 oxen, 1,345 sheep, and 26 pigs were brought from America, the principal importer of oxen being Italy.

Baron J. J. Van den Wyngaert, President of the German Millers' Association, is visiting this country, at the request of the German government, to inspect the various wheat-growing regions and the methods of milling. He praises Minnesota and northern Dakota as the best wheat-growing States. He says that great injury is done to farmers of that section by grain merchants and elevator men, inasmuch as their choice wheat comes to European dealers so mixed with inferior grades that it is much depreciated, and Russian wheat not nearly so good, has to be used to give proper strength to the flour.....Thrashers in Indiana state the wheat in that State is light this season. Several experiments show that a hundred bushels of the growth of this year weigh only as much as ninety-two bushels raised last year. The light weight is evidently due to the hot weather in June which hastened the growth of the grain too rapidly..... ....The North American Beekeepers' society will hold its annual session at Cincinnati, Ohio, on Wednesday, Thursday and Friday, September 29, 30 and Oct. 1, 1880, commencing at 10 A. M..... In Canada the Grand Trunk authorities have received their annual report of the state of the crops from 159 places on the line of the railroad, from the State of Maine, in the East, to Detroit, in the West. The report states that Fall wheat was partly winter-killed in some sections between Toronto and Port Hope; from Toronto to Sarnia it is very good, and promises a yield of twenty-five to forty bushels to the acre. Spring wheat in many places is badly injured by rust, and, to all appearances, will fall considerably below an average. Peas and corn are generally looking well, and promise a large yield. Barley and oats are progressing satisfactorily. Hay is considered above an average crop. Clover-seed was partly winter-killed. Flax is excellent, and hops are everywhere looking well.....The stocks of pork at Chicago and New York on August 1 aggregated 197,666 barrels, against 223,181 at same date last year—a decrease of 25,515 barrels.....The stocks of lard in New York and Chicago on August 1 amounted to 174,525 tierces, against 259,045 at same date in 1879—a decrease of 84,520 tierces.....The stock of flour in Chicago August 1 is reported at 26,325 barrels, against 38,461 on July 1 and 16,200 on August 1, 1879.

LYDIA E. PINKHAM'S VEGETABLE COMPOUND has done thousands of women more good than the medicines of many doctors. It is a positive cure for all female complaints. Send to Mrs. Lydia E. Pinkham. Sold by all druggists.

Life and health are preserved by carefully aiding nature whenever it shows lack of ability to carry on its work. For torpid liver, bowels or kidneys, no other remedy equals Kidney-Wort.

Kidney-Wort radically cures biliousness, piles and all nervous diseases.

Dr. Pierce's Golden Medical Discovery, cures every kind of humor, from the worst scrofula to the common pimple or eruption.

Four to six bottles cure salt-rheum or tetter.

One to five bottles cure the worst kind of pimples on the face.

Two to four bottles clear the system of boils, carbuncles, and sores.

Four to six bottels cure the worst kind of erysipelas.

Three to six bottles cure blotches among the hair.

Six to ten bottles cure running at the ears.

Five to eight bottles cure corrupt or running ulcers.

Eight to twelve cure the worst scrofula.

Sold by druggists, and in half-dozen and dozen lots at great discount.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug 7, 1880.

BEANS AND PEAS.—Marrow beans have had some good export call which has left the market firm. Prime mediums are not plenty and prices are working upwards. Of pea or white kidney there is little stock. Red have advanced 5c., small orders filling. Green peas quiet at $1.65@1.70. Stock still arriving. B. E. peas as before, $2, when carefully selected, ₱ 2 bush. bag.

Marrow beans, prime, $1.62½@1.65, other, $1.50@1 60; medium, prime, $1.42; other, $1.30@1.73; pea, $1.45@1.65; white kidney, $1.70@1.85; red kidney, prime, $1.50; other, $1.30@1.45; black (or turtle soup), $2, and dull and easier; Cal, Lima, $5.

Receipts of beans for week, 1,208 bush.; exports, 781 pkgs.

BEESWAX.—Small sales at 25@25½c. for Western and Southern.

BROOM CORN.—Trade is light on account of small stock.

Brush and short broom, choice, per ℔., 7@8c.; do., do., common to good, 5@6½c.; hurl, good to choice, 7@8c.; do., common to fair, 5½@6½c.; red and crooked at 3@4c.

BUTTER.—In a wholesale way the market for best creamery is off, but special selected parcels may be quoted up to last week's figures. There is a better offering of table grade State, much of which equals in quality first-class grocers' wants, and the fact deprives creamery of much of its former strength. Oleomargarine begins to conflict with common styles of stock. The unroad is not as yet serious. Western butter holds its own in price, as supplies are not heavy. Exporters are not in treaty for much new business at the moment. The amount taken represents earlier purchases.

Creamery, finest State, 26c.; finest Western, 25c.; good to prime, 23@24c.; fair to good, 22@23c.; sweet cream, fine, 21@25c.; fair to prime, 23@24c.; State, firkins, choice yellow, 22c.; fair to prime, 20@21c.; State, pails and h'f. tubs, choice, 23c.; good to prime, 21@22c.; fair to good, 20@21c; tubs, poor, 16@18c.; Welsh tubs, choice, 22c; good to prime, 20@21c.; fair to good, 19@20c.; Western imitation creamery, 16@22c.; dairy, frish, extra, 20@22c.; good to prime, 18@20c.; fair to good, 17@18c.; poor to fair, 14@17c.; factory, Iowa, June, fine, 18@18½c.; good to prime, 16@16½c.; fair to good, 15@16c.; poor to fair, 14@15c.

Comparative receipts and exports for the past four years:

June 1, 1877, to Aug. 1, 1877...	241,077	44,585

CHEESE.—The market has been feverish and excited this week and has made a sharp advance. The receipts have been moderate, which has indicated the firm holding of countrymen, and the advices from the other side have been encouraging to shippers who have been anxious to obtain supplies, and by the strong competition have placed in cases extreme values on certain special lots. Up to 12c. has been made, but 11¾c. generally represents the market.

Quotations are: State factory, fancy, at 11¾c.; do. good to prime, 11@11¼c.; do. fair to good, 9¾@10¾c.; do. half skimmed, 7½@8½c.; Wisconsin factory, fine, 10¾@11¼c., do. good to prime, 10¼@10½c.; do. fair to good, 9@10c.; Ohio factory, fine, 10¾@11¼c.; do. good to prime, 9¾@10¼c.; do. flat, fair to good, 8¾@9¾c.; do, poor to fair 7½@8¾c.

LIVE STOCK MARKETS

NEW YORK, Saturday, Aug. 7, 1880.

BEEVES.—Receipts for week 14,331 head; do last week, 13,868 do. Heavy failures among butchers took the spirit out of the market. Drovers begin to discriminate between the cash purchaser and one who buys on 15 or 21 days' time more closely than has been the case for over two years; and the financial condition of all the buyers will be keenly studied. Butchers who expect to pay for their cattle took some advantage of the situation, and sellers were forced to lower prices a trifle from the current rates on last Wednesday. Sales, however, were very irregular, and the general tone of the market especially at the close was turning in buyers' favor. Texas cattle were mainly sold at 6¾@7¼c. to dress 55 ℔.; common to fair native steers at 8@8¾c. to dress 55@56℔, good to choice do at 9@9¾c. to dress 56℔, and a few extra at 10c.

COWS AND CALVES.—There is only a peddling sort of a market. Very common quoted at $25@30; then $35@45; is quoted for good milkers and if a dealer stretches a price up to $50 or 55 for really prime it is looked upon as a banner sale.

VEAL CALVES.—Demand good with moderate supply; prices firm

Live calves, N. J. and Bucks Co., choice, 6¾@7c.; prime, 6¾@6¾c.; State choice, 6¾@6¾c.; prime, 6@6¾c.; fair to good, 5½@6c.; poor, 3½@4½c.; heavy, good to prime, 5½@6½c.; buttermilk, 2½@3c.; grass, 2@2½c.

SHEEP AND LAMBS.—Receipts for week, 36,047 head; do last week 31,552 do. The week has been an extremely dull one, and at the close there seemed to be a chance of much giving away in prices. Sales at 3¾@5¾c. for sheep and 5@6c. for lambs, with a few New Jersey at 6½@7½c.

SWINE.—Receipts for the week, 25,564 head; do last week, 18,831 do. Live steady at 5@5¾c. City dressed 6¾@6¾c. heavy to pigs.

TERMS FOR 1880.

The Literary Revolution.

What Is It? It is a method of placing literature, of the best class only, within reach of every one. Books are reduced in price to but a fraction of their cost heretofore. July is supposed to be the Dull Month of the year. Booksellers close shop and go fishing, because book buyers are supposed to have done likewise. The Literary Revolution has made the past July one of the busiest months of the year for dealers handling our books, because the people believe in it. Letters have come to us like a flood; telegrams from dealers have come like the day before Christmas, calling for more books, and quickly. Our bindery is now taxed for the production of 4000 volumes a day, not counting pamphlets, and we are taking immediate steps to double its capacity, to keep up with orders. All Revolutions seek volunteers, and it has been the policy of The Literary Revolution from the start to give special reward to early volunteers in its support. It offers special terms to all whose orders, with cash, are received during August, as follows;

August Opportunities. **July Victories.**

Chambers's Encyclopædia.

A verbatim reprint of the last English edition, in 15 beautiful volumes, clear nonpareil type, handsomely bound in cloth for $7.50; the same printed on finer, heavier paper, wide margins, and bound in half Russia, gilt top, price $15.00. The first eleven volumes are ready for delivery. Volume 12 will be ready Aug. 15. The remaining volumes will be completed by October.

AN AMAZING OFFER.

To all whose orders and money are received during the month of August, we will supply the 15 volumes, in cloth, for $6.50, and in half Russia, gilt top, for $13.00. The volumes issued will be sent at once by express, and the remaining volumes when completed.

A specimen volume in cloth will be sent, postpaid, for 50 cents, or in half Russia, gilt top, for $1.00, and may be returned at once, if not satisfactory.

The "CHAMBERS'S ENCYCLOPÆDIA" comprises the first 15 volumes of our "Library of Universal Knowledge," and the remaining volumes, complete in themselves, will be sold separately when published.

Curiosities. To illustrate and demonstrate the superior literary and typographical character of our books, notwithstanding prices are low beyond comparison with the cheapest books ever before published, we publish twelve books in pamphlet form and send postpaid as follows. As mere curiosities they are worth obtaining by every one, even if they were not intrinsically valuable. As might be expected, they are selling by the million. All the following are unabridged, and none of them are in type smaller than brevier. Nearly all of them have heretofore been published by other houses at from $1.00 to $1.25 each. Macaulay's "Life of Frederick the Great," Carlyle's "Life of Robert Burns," Thos. Hughes' "Manliness of Christ," John Stuart Mills' "Chapters on Socialism," Mary Queen of Scot's Life, by Lamartine; "Leaves from the Diary of an Old Lawyer"—short, thrilling, laughable, pathetic stories—each complete, price three cents. "The Light of Asia," by Edwin Arnold; "Baron Munchausen's Travels and Surprising Adventures;" "Vicar of Wakefield," by Oliver Goldsmith; "Stories and Ballads for Young Folk," illustrated, by Ellen Tracy Alden, each five cents. Closing the list is Bunyan's "Pilgrim's Progress," price six cents; and "Private Theatricals" (humorous stories, not plays), by author of "Sparrowgrass Papers," price, two cents.

Books, 3 Cents. **Books, 5 Cents.** **6 Cents—2 Cents.**

Notwithstanding the amazingly low prices of these pamphlets, they pay us a good profit. The Literary Revolution does not humbug people by pretense of philanthropy. People who have sense enough to appreciate good books are generally honest enough to be willing to pay for them, and they can afford to pay when prices are low as the Revolution makes them. In this connection it is proper to mention a few facts.

Stop Thief! Some millionaire publishers have been adding to our fame and multiplying our friends by calling us pirates. They pay (when they please) foreign authors a copyright. One of them charged you $1.00 for Hughes' "Manliness of Christ"—we sell it to you for 3 cents. How much of the 97 cents difference did Hughes get, do you think? Another published Geikie's "Life of Christ" for $3.00—our price is 50 cents. How much did Dr. Geikie get of the $2.50 difference? His letter to us says "nothing." Scribner's Monthly attacked us recently, calling us Cheap John Publishers. The same electrotypers and printers that do their work are working also for us, and you want no books more beautiful than are some of ours. The great Methodist Book Concern has refused us space even in the advertising columns of its several Christian Advocates. Why? Our books are so cheap they contrast with and injure the sale of theirs. We reduced Smith's "Bible Dictionary" from $3.00 to 50 cents; Kitto's "Cyclopedia of Biblical Literature" from $10.00 to $2.00; and Young's "Analytical Concordance to the Bible," "the Webster Unabridged" of religious literature, the greatest work of the kind which the century has produced, from $15.00 to $2.00. The people only pronounce the verdict who is guilty of wrong-doing—we, or the millionaire publishers

Who Is He?

General Grant. General Grant once said that the best way to get rid of a bad law is to enforce it. If the want of an international copyright is a wrong to foreign authors, American publishers are to blame that there is none, and could influence the passing of such a law quickly if they chose to do so. We believe that the author of a book is as much entitled to absolute property in it the world over as is the author of any other product of the hand or brain. We vote for a law to give him such ownership, and The Literary Revolution more than all other influences is forcing the consent of millionaire publishers to the passing of such a law. But there is plenty of humbug in the talk of high prices being the necessary result of copyright. Five cents copyright on a book would give an author $5,000 on a book that would sell 100,000 copies; and a book intended for the masses that will not sell 100,000 if put at a reasonable price does not deserve to be published at all. And the really standard books that the masses want ought to sell and will sell a million copies each easily when The Literary Revolution has achieved its final victories and made the masses readers of good books. And a million books, paying copyright of even one cent each would give an author $10,000, which is more than ten times what the average successful author now gets. But Bunyan, Goldsmith, Milton and Virgil are no longer wanting copyright, and Macaulay, Carlyle, Gibbon, De Foe, Plutarch and Æsop ceased to receive it long before the days of The Literary Revolution. We do pay five to fifteen cents copyright on several of our books to American authors who have the right to it, and we are paying regular salaries, many thousand dollars a year, to writers in our service.

Standard Books.

Library of Universal Knowledge, 21 vols., $10.50.	Munchausen and Gulliver's Travels, illus., 50 cents.
Milman's Gibbon's Rome, 3 vols., $2.50.	Stories and Ballads, by E. T. Alden, illus., 50 cents.

Reading for the Young.

DAISY'S STAR.

BY SARAH HALE THOMPSON.

EARLY one morning I peeped out, just to see about the weather. O, how cold it was for me, a poor little shivering star; but I had no nose which Jack Frost could bite off, so I did not complain. Besides, as I am always looking out for pretty things to tell my little friends, it is very easy to forget my troubles, and especially when I know that many children would have tears in their eyes if I should neglect them.

All of a sudden something beautiful came out of a great white cloud. O, how glad I was, for then I had something for my little ones; something nice, too, for it was such a tiny, nice, wee white thing; I had to watch it very closely to see it at all.

"Dear me," I thought, "it will surely get lost, it is all alone;" and I made up my mind to keep my eye on it.

Now if you would like to know what it was, I will tell you rightaway, for I am sure you cannot guess. It was the sweetest little star I ever saw. Not blue, or red, or yellow, but soft and white like snow; and it was a snow-flake shaped like a little perfect star.

It whirled round and round a little and then went down very slowly; I just wondered what would become of it. Where do you think it went? Why, right on the hand of the loveliest little bit of a girl you ever saw.

She had on velvet mittens, and her name was Daisy Vane.

Presently her blue eyes fell on the little thing resting on her mitten. They grew large with wonder at the strange sight, for never before in her life had she seen a snow-flake shaped like a star, and this is what she called to her mother, all out of breath with delight: "Oh, mamma, mamma, come quickly, and see the dear little star that has come to me out of the sky!"

Mamma came quickly, but she was too late, for Daisy's treasure had vanished in a moment, and the little face she lifted, instead of being all smiles was streaming with tears.

Mamma took Daisy's hand and looked sorrowfully at her little girl. She was thinking she was once a little girl herself, and how hard it used to be to bear troubles then. "Will my darling tell me why she so longed to keep the lovely star?" she said.

"O, mamma," weeps Daisy, "I would have strung it on my necklace and told all my little friends that God had sent me a baby star all for myself."

Mrs. Vane smiled on her pet, and said, "Would Daisy be happy if God should send her something that she would like as much, and perhaps better, than a star on a simple necklace?"

"O, mamma, what could I love better than a beautiful pearl-white star? No, no, I do not think there is anything in the world I would love more than that, besides, none of the girls ever had anything like it. But what is it, mamma? Do, please, dear mamma, tell me," Daisy asked, her face looking very eager.

Mrs. Vane drew her daughter tenderly to her, and winding her arms about her, said lovingly:

"Will not my darling wait patiently till God sees fit to bestow the blessing?"

Daisy is doubtful at first, but when she sees the beautiful expression on her mother's face she is sure it is a good thing to be patient, for she says, as she kisses her:

"Yes, mamma, I will try," and then she runs to tell her little companions.

Every night before she closed her eyes in sleep she would turn her sweet face to the stars and think of her lost one and pray for another; then she would wonder and wonder about her mamma's promise, and fall asleep wondering.

But it was not many nights. One bright morning as Daisy lay dozing, dreaming, thinking, thinking, all at once Aunt Nellie stood at her bedside, with her face all smiles and happiness. Daisy looked at her with her drowsy eyes, and tried to think she was a big angel. Aunt Nellie looked full of secrets and said:

"I know a little girl who would hurry very fast if she knew of the beautiful present God had sent her."

"Oh, Aunty!"—she is wide-awake now, and tosses back her golden curls—"Oh, Aunty, has my present come at last? And is it a necklace, set with a lovely pearl star?"

"No, Daisy; you must wait till you are nicely dressed, and then you shall see, for you cannot guess if you were to try ever and ever so long."

Daisy never dressed so quickly in all her life. Her other aunt and her papa met her at the door.

"Come, my darling," says papa, "your dear mamma has something for you; step lightly," and he takes her trembling hand with joyous excitement. She rushes to her mother and half smothers her with kisses, and then looks around with bright eyes and eager, flushed face, for her promised present. She clasps her hands and says:

"Oh, mamma, show me my present, for I cannot wait another minute."

"Grandma has it, my pet."

Grandma sits by the fire, and seems to be wrapping up her lame arm. Daisy thinks so, but it is something else that moves. Daisy's heart gives a big leap, and she runs back, buries her face in her mother's bosom, and cries a long time for very joy; for what do you think she saw in a flannel nest? Not a necklace—not a star—not a snow-flake—oh, no! but a baby, a little tiny bit of a real baby, lying fast asleep in grandma's lap. Daisy thought she had never felt happiness before. She runs back to her grandma and kneels down to see if she has not been dreaming. Grandma cautiously and tenderly lays something in her hand. It is a baby's hand, a little mite of a thing that made Daisy think of a snow-flake.

"Oh, grandma, let me kiss it." Then she presses her red lips to the soft little mouth, cheeks and eyes, and then hands and feet, over and over again, till everybody laughs.

"Are you satisfied?" says mamma.

"Oh, mamma, has it no name? Then, papa, we will call it Star Baby, shan't we? And I shall so love it, because it came in place of the beautiful snowstar."

Her mamma laughed gently, and said she thought she would love it much better than a snow baby. Grandma thought so, too; so it was called Baby Star, and it is the first star baby I ever saw.

HOW BIRDS FLY.

You will find, if you carefully examine a bird's wing, that all the bones and muscles are placed along the front edge, which is thus made very stiff and strong. The quill feathers are fastened in such a way that they point backward, so that the hind edge of the wing is not stiff like the front edge, but is flexible and bends at the least touch. As the air is not a solid, but a gas, it has a tendency to slide out from under the wing when this is driven downward, and of course it will do this at the point where it can escape most easily. Since the front edge of the wing is stiff and strong, it retains its hollow shape, and prevents the air from sliding out in this direction, but the pressure of the air is enough to bend up the thin, flexible ends of the feathers at the hinder border of the wing, so the air makes its escape there, and slides out backward. The weight of the bird is all the time pulling it down toward the earth; so at the same time the air slides out upward and backward past the bent edge of the wing, the wing itself, and with the bird, slides forward and downward off from the confined air. It is really its weight which causes it to do this, so that the statement that a bird flies by its own weight is strictly true.

This is true, also, of insects and bats. They all have wings with stiff front edges and flexible hind edges which bend and allow the air to pass out, so that flying is nothing but sliding down a hill made of air. A bird rises by flapping its wings, and it flies by falling back toward the earth and sliding forward at the same time. At the end of each stroke of its wings it has raised itself enough to make up for the distance it has fallen since the last stroke, and accordingly it stays at the same hight and moves forward in a straight line.

If you watch the flight of those birds which flap their wings slowly, such as the woodpecker, you can see them rise and fall, and will have no trouble in seeing that their path is not really a straight line, but is made up of curves; although most birds flap their wings so rapidly that they have no time to fall through a space great enough to be seen. Birds also make use of the wind to aid them in flight, and by holding their wings inclined like a kite, so that the wind shall slide out under them, they can sail great distances without flapping their wings at all. They are supported, as a paper kite is, by the wind, which is continually pushing against their wings, and sliding out backward and downward, thus lifting or holding up the bird, and at the same time driving it forward.

The birds are not compelled to face the wind while they are sailing, but by changing the position of the wings a little they can go in whatever direction they wish, much as a boy changes his direction in skating by leaning a little to one side or the other. Some birds are very skillful at this kind of sailing, and can even remain stationary in the air for some minutes when there is a strong wind; and they do this without flapping their wings at all. It is a difficult thing to do, and no birds except the most skillful flyers can manage it. Some hawks can do it, and gulls and terns may often be seen practicing it when a gale of wind is blowing, and they seem to take great delight in their power of flight.

CONSTANCY.

ONE of the most remarkable instances of feminine fortitude and Christian constancy ever found in human history, is that of Perpetua, who suffered under the persecution of the Roman Emperor, Severus, at Carthage, in Africa, about the year 206, A. D.

Perpetua was a young widow of 22 years, wealthy, and of noble connections. Her infant, who was born after her husband's death, was her companion in her troubles.

She was arrested for doing divine honors to Christ and not to the spirit of the Roman Emperor.

Her father, who was a heathen, urged her to renounce her faith. She asked him whether an urn, which stood near, could be called by any other than its proper name. He replied "No." "Neither," said she, "can I call myself other than what I am—a Christian." After spending many days in prison, with her infant, during which time she was blessed and comforted with the most cheering and heavenly visions every time she fell asleep, her heathen friends asked her if she would not at last recant before the dreaded trial and execution.

She declared that as for her sentence of death, God would carry her through that trial, and as for the prison, she said, "The prison all at once became like a palace to me, and I would rather have been there than anywhere else."

It was, no doubt, this expression which the Rev. John Newton, the converted slave-dealer, had in mind when he wrote in that familiar hymn:

"When blessed with a sense of His love,
A palace a toy would appear;
And prisons would palaces prove,
If Jesus should dwell with me there."

Perpetua, with her faithful companions and her infant, were condemned to the amphitheatre. The male victims were exposed to lions, bears and leopards; the women were tossed by a furious bull.

Perpetua appeared as if in a trance, insensible to the pain. On recovering her consciousness she asked when she would be dispatched by the gladiator, for those who survived the wild beasts were subjected to the sword of the gladiator. The youth who was appointed to dispatch Perpetua was so overcome by her calmness that he bungled at his work, whereupon the resolute martyr guided his sword to a mortal part.

It was such lives and spectacles as these which gave power and vigor to the Christian church at Carthage.

And it is such events as these early martyrdoms which caused the historian, Gibbon, to wonder at the mysterious power which was lodged in the early Christians' breasts, as he himself has recorded these instances in his famous work, "The Decline and Fall of the Roman Empire."

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I am ten years old and this is my first attempt at writing for a paper. My father is a farmer. We keep nine cows and I have a pet sheep. We have seven Toulouse geese which make a great noise sometimes, and attract a great deal of attention as there are no other geese in our neighborhood. I go to school and have a mile to go. I have no brother or sister so the way seems long. My father planted the potatoes you sent him and raised 20 pounds. I thought I would write so that I might get some flower seeds and have flowers like the rest of the RURAL cousins.

Broome Co., N. Y. ANNA S. KNAPP.

DEAR UNCLE MARK:—I am a little girl twelve years old. I live in the country. I go to school and my teacher's name is J. A. Lewis. My mother takes the RURAL NEW-YORKER and I like it very much. Yours truly, AGNES T. O'CONNOR,

Wabaunsee Co., Kan.

BRIEFLETS.

DR. HEXAMER says: "In watering plants in the open ground, it is far better to apply three cans of water every third than one can every day. . . . . Stuartia pentagyna is one of the most beautiful, hardy shrubs and, though found in the Alleghanies of Southern Virginia, is rarely seen in our gardens. Readers who have shrubs to select this Fall, or rather next Spring, are advised to make a note of this. It belongs to the Camellia family, and bears large, cream-colored flowers. . . . . Cinerarias, calceolarias and primulas, if started from seed now, will make a fine display during Winter. . . . We are deeply obliged to our readers for the lively interest they are manifesting in the Fair Number of the RURAL NEW-YORKER. It sometimes seems to us that the RURAL has stronger friends, and more of them than any other paper of "its size and age" published anywhere. . . . . It seems that a portion of Mr. Orange Judd's notes (those taken last season while traveling in the West,) "unaccountably disappeared from his traveling bag." Why anybody should have stolen those notes, if there was anything else in the "traveling bag"—or if there was not—*is* unaccountable — that is a fact! . . . . . There have been established in London by a Drinking-fountain Co. 438 water-places in the streets. . . . . .

"Happy the man who tills the field,
Content with rustic labor;
Earth does to him her fullness yield,
Hap what may to his neighbor.
Well days, sound nights, O can there be
A life more rational and free?"

We see mention of Stoll's Monarch rhubarb, an English variety, the weight of some of the leaves and stalks of which is about seven pounds. . . . . The best Summer resort for a Spitz dog is a watering place. The dog should be placed about four feet under water.—[Norristown Herald. . . . . To completely blindfold a vicious horse is the simple stratagem of a correspondent of the London Live Stock Journal for rendering him as quiet as a lamb. The most obstreperous may then be shod without difficulty. . . . . The agricultural editor of one of the daily-weeklies—the New York Sun—asks his subscribers to give their experience as to London-purple, as he seems to entertain doubts as to its efficacy. A few cents' worth of the Purple and the loan of a neighbor's potato-patch would enable him to settle his doubts, without troubling his subscribers. *Then* he could tell them as to its efficacy, which would seem to be a part of an agricultural editor's duties. . . . . The Garden (London,) says that the "roses of the future are the roses on their own roots." What a world of tedious labor, then, has been thrown away on rose propagation. . . . . Our readers, or those of them who received and planted the Vilmorin Golden mangel, will find that they are as sweet, juicy and tender as a sugar beet, if cooked in the usual way. . . . . "The average woman's waist measures thirty inches; the average length of a man's arm is thirty inches. How admirable are thy works, O Nature!" The author of the above is not known. . . . . "The Hour" of July 24th, gives a colored cartoon of the young proprietor of the Herald. . . . . A late London Punch has the following:

AT THE CATTLE SHOW.

Young Farmer.—"Are you fond of beasts, Miss Gusherton?"

Miss Gusherton.—"Oh, really, Mr. Pawker, if you mean that as a declaration, you must speak to mamma." . . . . . Col. F. D. Curtis says, in the New York Tribune, "Less pig-pen and more pig-pasture." . . . . We have never known any raspberry to be so overwhelmed with praise as the Cuthbert is at the present time. We only hope this praise is not being lavished too freely. We find the following in the catalogue of E. P. Roe just received:—Now regarded by careful and experienced horticulturists as the best raspberry in existence for general cultivation. I have it in a specimen bed with twenty-five other kinds, and under precisely the same treatment it has surpassed all others. "It is better than all the others by long odds."—Dr. Farley. "I regard it as the best raspberry for general cultivation."—Charles Downing. "It is regarded as the best raspberry in existence."—Dr. Hexamer. . . . . We like to give credit where credit is due. Mr. J. T. Lovett was the first to call our attention to the superiority of this raspberry over others—and it was in this way that we were induced to place it in our Plant and Seed Distribution, which—it will not be denied—has precipitated, it not created, its present popularity. . . . . A contemporary whose name need not be mentioned, says that "some farmers are testing the value of cultivating wheat and their results are almost uniformly in favor of the practice." The contrary is the fact, if we may judge from our own tests for two years and those of others—Prof. Roberts, for instance, of Cornell University. . . . . One of our market gardeners informs us that black pepper will rid cabbages of worms just as effectually as hot water and is more easily applied. . . . . At present, the Mark Lane Express observes, there is no class of people in the land so badly situated in respect of education for their children as farmers are. . . . . Prof. Stewart thinks the cow-pea is a more valuable food for ensilaging than green corn. The amount of vines which these plants make—or some kinds of them—at the RURAL FARM, is surprising. . . . . The White Egg turnip. This is a new sort of quick-growing turnip of an egg shape and white skin, as its name suggests. A friend who raised it last year speaks of it in very high terms of praise. He says it is tender and sweet. It should be sown about the middle of the month. . . . . From our own experience, we confidently recommend all farmers—at least, those whose soil is a sandy loam—to use a roller after grain sowing.

Remedies.

I have found the following remedies effective:—

REMEDY FOR THE CURRANT WORM.—Dissolve one pound of coperas in a pail of water and sprinkle the bushes with the same. This has proved a certain remedy with me.

REMEDY FOR THE CABBAGE WORM.—Give the cabbages a thorough sprinkling with lime water.

CURE FOR SCOURS IN CALVES.—Break a new-laid egg in their milk and stir it up with the milk and let them drink it. It is a sure cure; I never knew it to fail. So simple a remedy ought to be widely circulated. W. S.

CATALOGUES, ETC., RECEIVED.

E. P. ROE, Cornwall-on-Hudson, N. Y., Summer and Fall Catalogue of pot-grown Strawberries; also, a list of the names and prices of such small fruits and grape-vines as he offers.

PERSONAL ITEMS.

The Duke of Wellington's plate has been estimated to be worth $1,500,000.

Gen. Hancock has a very pleasant suburban home, thirty miles by railroad from St. Louis. The house is spacious and is surrounded by ample grounds which command a view of the Mississippi,

Now it is a Yankee, Mr. Samuel Bromley, of Mystic River, in the State of Connecticut, who announces his ability to live for ten hours with his nose and mouth hermetically sealed. Where is this thing to stop?

Dr. Germaine has for three years been blind, yet he continues to practise acceptably at Westfield, Mass. His wife accompanies him on his calls, describes to him the visible symptoms of his patients and assists him in other ways so well that he has lost none of his business.

Prince Victor, the eldest son of Prince Napoleon, has just attained his eighteenth year, and with it his majority, according to the custom of his house. He is still studying at the Lycee Charlemagne, and next year will probably present himself for admission to St. Cyr, the famous military school of France. The Prince is described as studious and intelligent. He is tall and of strong build, and partial to field sports, at which he is an adept.

Hope for Consumptives at Last.

From the official record, we learn that over sixty thousand persons die annually in the United States from pulmonary consumption. In each of these cases there was a first or incipient stage of the disease, when all the life-forces and organic structures were not unimpaired by its encroachments. If at this time an agent had been found which could give to the system a higher degree of vitality, and so enable it to resist the deadly assault this perilous crisis would have been safely passed. And not this one only. In every subsequent assault of the enemy, especially where there existed some hereditary taint, a prompt resort to the same re-vitalizing agent would have given a like relief and immunity. Now it is confidently claimed, and the claim is substantiated by the result of over twelve years' experience of its use, that just such an agent has been discovered in COMPOUND OXYGEN, the use of which is rapidly extending. If you wish to learn all about this new treatment, address DRS. STARKEY & PALEN, Philadelphia, Pa., and they will promptly mail you their Treatise on Compound Oxygen.

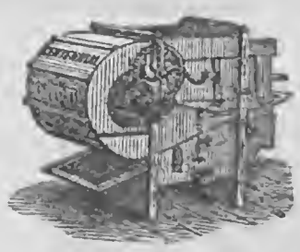
The "Centennial" Fanning Mill.



The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect cleaner of Flax, Timothy, Clover and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List. Liberal discount to dealers. Address, S. FREEMAN & SON,
Racine, Wis.

THE request often made by publishers that readers will mention their journals when answering advertisements, seems to us a very reasonable one. Such mention is a helpful and friendly act to the journal mentioned and enables the advertiser to determine which journals are the best advertising mediums. Reference to our advertising columns will show there is not one advertisement of an exceptional or ambiguous character admitted. In so far as this is possible we hold ourselves responsible for their high-standing and trustworthiness.

Humorous.

A SALEM youth calls his lady love "oleomargarine," because he hasn't any other but her.

BRIDGET—"And how shall I cut the poic, mum?" Lady of the house—"Cut it into quarters." Bridget—"And how minny quarters wud I cut it into, mum?"

"MY! what a steep hill! And see those ten or eleven wretches packed in one wagon that the poor staggering horse can hardly draw." "Wretches? Them are all Christians, mum, going to camp-meeting."

"SHON," said a Dutchman, "you may say what you please 'pout pad neighbors; I have had te vorst neighbors as never vas. Mine pigs and mine hens come home mit dere cars split, and todder day two of them come home missing!"

"I SUPPOSE," said a punning lady to a sailor whom she saw holding the rudder of a boat, as she was sauntering on the seashore, "I suppose that your favorite tree is the 'elm.'" "Yes, madam," he responded, "and I see that your favorite is the beach."

You may say what you please about it, but there is luck in horse-shoes. A woman nailed one up against a woodshed a month ago, and last week the husband eloped with the hired girl. The man had not earned a cent for more than two years.—B. Dadd.

ROBINSON (after a long whist bout at the club)—"It is awfully late, Brown. What will you say to your wife?" Brown (in a whisper)—"Oh, I shan't say much, you know. 'Good morning, dear,' or something of that sort. She'll say the rest."—Exchange.

A PEDAGOGUE told one of his scholars, a son of the Emerald Isle, to spell *hostility*. "H-o-r-s-e, horse," commenced Pat. "Not *horse*-tility," said the teacher; "but *hoss*—tility." "Sure," replied Pat, "an' didn't ye tell me, only the other day, not to say *hoss?* Faith! its *wan* thing wid ye one day, and another the nixt."

A GENERAL, sitting in front of a hotel in time of war, heard a newsboy crying his papers, "all about the battle." The general bought a paper, but could not find the account of the engagement. Turning to the newsboy, he said: "I do not see any battle." "No," said the boy, "you never will if you sit here!"

"I ONLY want to show you one thing more, Professor, I have invented a short method of boring mountains which I think will prove very valuable," "My dear sir," burst forth the wearied listener, "if you would only invent a short method of boring individuals you would indeed confer a lasting benefit upon the race."

"How came these holes in your elbows?" said a widowed mother to her only son. "Oh, mother, I hid behind the sofa when Colonel Gobler was saying to Maria that he'd take her even if you had to be thrown in; and he didn't know I was there; and so I held my tongue and laughed in my sleeves till I burst 'em."—Little's Living Age.

A WEALTHY upstart goes to a sales stable to buy a pair of carriage horses. "Here are a sample of fine English-bred mares," says the proprietor. "English-bred! They will not do." "Why?" "My coachman is a Frenchman," "Well!" "If they were raised in England they couldn't understand a word he said."

AN exchange says: "A Boston artist painted an orange peel on the sidewalk so naturally that six fat men slipped down on it." We would like the artist to call this way and paint blocks of ice on our sidewalks about the present time, just for the purpose of ascertaining how many degrees cooler the imagination would make it.—Washington Star.

"DON'T get out of anybody's way," advised Henry Ward Beecher. But, Mr. Beecher, when you recognize your landlord only half a block away, and it is three days past rent day, and there are two cross streets, an alley and three four-story stair-ways with rear exits winking at you from the near side of the street—are we—is a man, that is, to go straight ahead and collide with the landlord? Oh, nonsense! what kind of talk is that to give a debt-laden people, with money at 9 per cent., and your Summer clothes not paid for?

An Inevitable Result.

Debility is an inevitable consequence of prolonged indigestion. There is no function whose vigor and activity is not impaired by this prolific cause of bodily evil. Secretion is interferred with, the nervous system is weakened and melancholia or despondency is superinduced by irregularity or weakness of the stomach. But though dyspepsia and its attendedant symptoms in many cases resist the operation of ordinary remedies, they cannot withstand the action of Hostetter's Stomach Bitters, a medicine to whose career of popularity, the annals of proprietary medicine afford few, if any parallels. It is not only a remedy but a preservative of health, enabling the system to withstand malarial and other extrinsic influences prejudicial to health, depurating and enriching the the blood, and restoring nerve power and tranquility. As a medicinal stimulant and corrective it is highly commended by physicians, who have thoroughly tested its good qualities.

JUST OUT. (AT ALL THE LIBRARIES.)

First young Lady.—"How did you like Convict Life, dear?"
Second young Lady.—"Pretty well. We've just begun Ten Years' Penal Servitude. Some of us like it, but ——"
Old Lady (mentally).—"Good gracious! What dreadful creatures! So young, too!" [Looks for the communicating cord!

Landscape Gardening.

LANDSCAPE GARDENING.

S. B. PECK.

This term, as I understand it, applies to the planting and tending of ornamental or pleasure grounds, and relates to the grounds about dwellings, public edifices, parks and cemeteries. The manner in which they should be laid out and planted depends much on their size, shape and surroundings, and no one can well make one plan entirely suitable for any two pieces of ground: therefore all special directions for grounds in general are liable, if followed, to produce effects in bad taste.

It is a principle generally assented to, that "curved lines are more beautiful than straight ones." There is also another principle, not perhaps so generally assented to, but of equal force, that "the beauty of a thing depends on its perfect adaptation to its use." In the arrangement of walks and drives these two principles are often confused, and the latter is ignored or sacrificed to the insane idea of adopting the former in cases entirely incongruous. Thus, a public building situated in the center of a large inclosed plat and used only for public offices, has entrances from the surrounding streets at each of its four corners, from which walks to the front and rear entrances are made in the shape of a crescent, thus increasing the distance from 10 to 15 per cent. In case of a fire, the firemen would surely cut across this arc to reach the burning building. Equally inappropriate would be grounds devoted exclusively to ornament and pleasure, like public parks, laid out in squares and parallelograms. Triangles might be in good taste, but rarely, and should be small, and there should plainly appear a reason for that particular shape at that particular place.

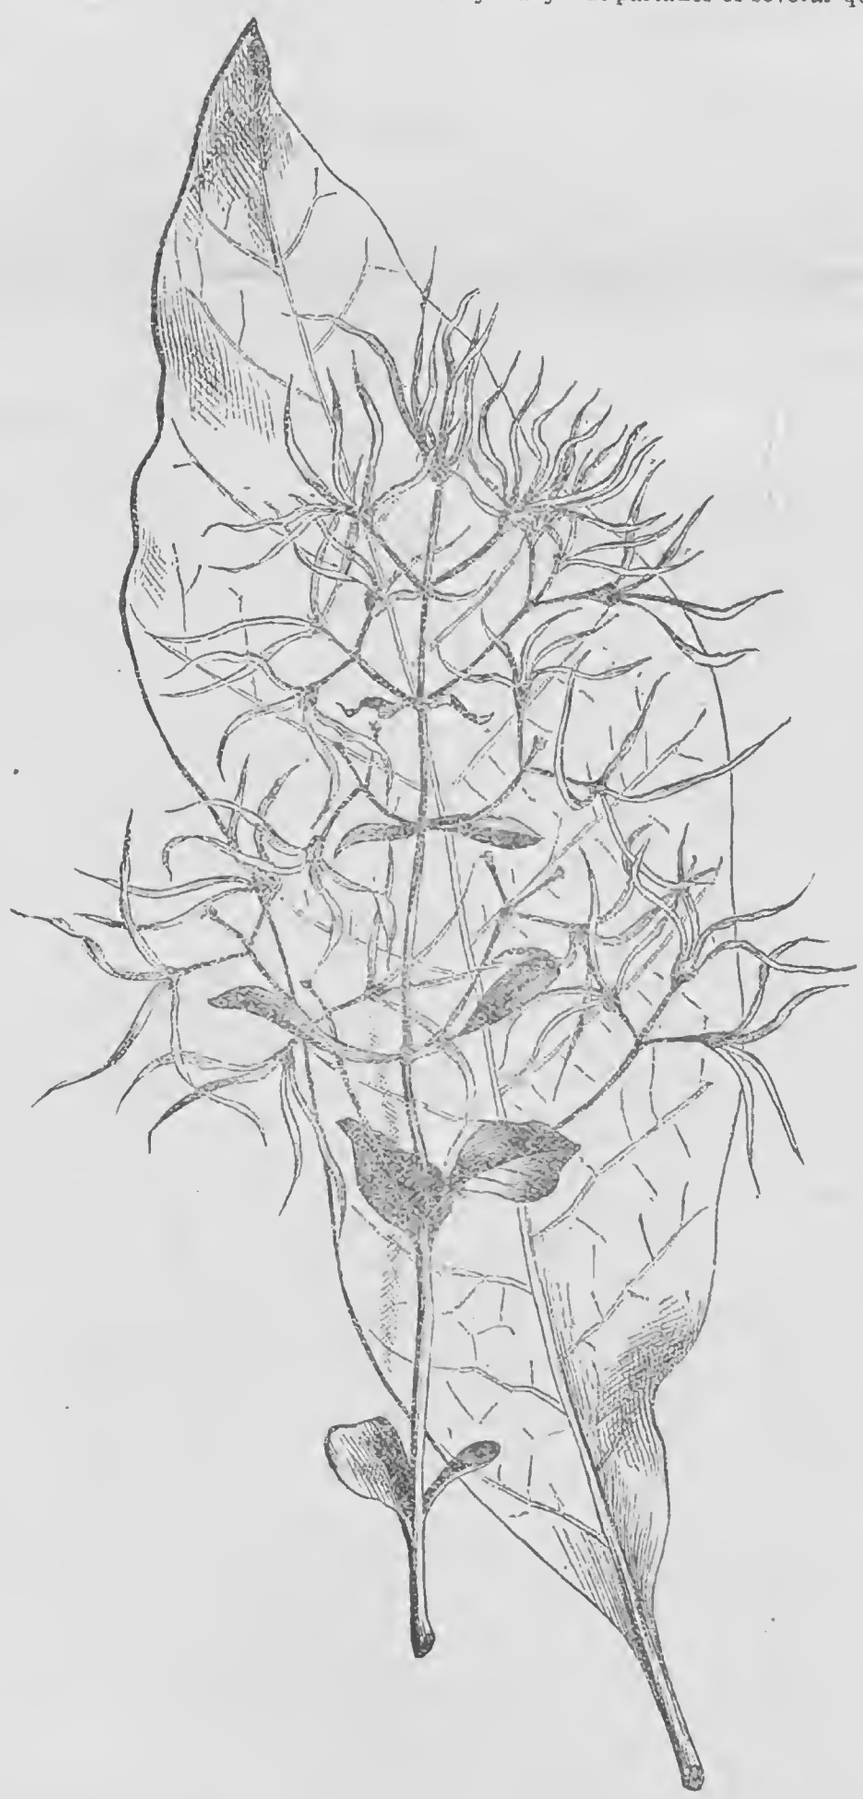
A walk from the street entrance to the front door of the house should be in a direct line, but branching from that walks are in good taste curving around the angles of the house to the side or back door.

In public or private parks and cemeteries the case is different. There curved walks and drives are indispensable to good taste. Let us look at the rationale of the thing. It is a waste of time to prolong the distance to a public office or to one's home, and it is not natural for business men to loiter by the way, therefore curved walks in such places are not well adapted to their uses, but if one's private grounds are sufficiently large to admit of a portion of them being devoted to ornamental trees, shrubbery and flowers, that portion is certainly beautified by walks in curved lines. People visit ornamental parks for purposes of pleasure and for their enjoyment of the beautiful in nature and art, but most especially for the former purpose. They visit cemeteries for the purpose of paying tribute to the memory of their departed dead. They go, in short, to *spend* time, to indulge their tastes. Curved walks there not only increase the distance and prolong the enjoyment, but if the objects to be viewed are arranged in proper order there is at every step a change of view, giving time to examine and individualize each tree, shrub, flower, fountain, bust or statue.

There is perhaps no one thing that shows a lack of taste more generally than the selection and arrangement of trees for ornament and shade. An almost universal error consists in having too many, a too studied regularity in their arrangement and too little variety. When planted in the street they must of necessity be in rows, and any deviation from a straight line there is a deformity, but a change of variety and of natural form gives to each an individuality and increases the pleasure of the beholder. Straight rows of one variety are only beautiful in the distance as one object, while a diversity of form and foliage multiplies the pleasure of a close inspection.

I am often pained at the efforts to distort nature in the pruning and training of ornamental trees and shrubs. Nature has her own form for every plant, and though you may increase the fruitfulness of a tree or vine by your edged-tool manipulations, as merely a thing of beauty you cannot improve upon nature's plans. Such is my own opinion of pruning and training for ornament. You may shear off the ends of the limbs of a spruce or fir, and make it look as though it had been turned in a lathe, the thick wall of its sides covering up its branches, but it will always be too sharp at the top, and I would prefer that it should stand behind the house as a specimen of what can be done in the way of outraging nature. Such a tree is to one of nature's make what a wax doll is to a real baby. It is true that accidents may happen in vegetation as well as in other matters. If a tree is near a building or too near other trees, it is liable to be misshapen, and its faults may often be corrected by pruning. A branch may be broken, the wind may sway the top or a rampant shoot may start up; in these cases we can assist nature with the pruning knife. In passing a fine spruce tree to-day, with the leader broken off, I was reminded of an item of my own experience some 25 years ago, when I had such a tree that grew two or three years with a flat top of four or five branches of equal size. I fastened one of these branches in an upright position, and in two years it was larger than all the rest, and it soon made a thrifty tree of most perfect symmetry.

Sheboygan Co., Mich.



THE WHITE FRINGE.—Chionanthus Virginica.—Fig. 265.

Arboricultural.

THE WHITE FRINGE TREE.
(Chionanthus Virginica.)

This excellent shrub is considered a tree by many. It partakes of several qualities one or another of which pertains to shrubs or trees, as the case may be. Twenty years old and planted singly where it has room to develop, it becomes as much a tree as the ash, to which, indeed, it is related. Grouped in masses with other shrubs or with plants of its own kind it assumes the habit of a bush. Singly also it looks a bush during its earlier days, being of slow growth and given to rounded forms. Related to the tree-like ash, on the one side, it is quite as nearly allied, on the other, to the shrub-like lilacs, forsythias and privets.

The White Fringe, though not exactly rare, is thoroughly choice in every way. There is not a quality about it from the crown of its head to the sole of its foot that is not rich or very good. The bark of the trunk or stem is smooth and light-colored and the leaves good-sized and shining—quite as interesting as those of the lilac, which is saying a good deal. Even the twigs group themselves in picturesque fashion. But the "crown of its head" bears its richest endowment after all. Its flowers are indeed unique. There is nothing at all like them in the great variety of inflorescence displayed by a large list of lawn plants. They make up wreaths, and clouds, and piles of lace, snow-white and dazzling. Plucked from the bush they are nothing; crowning the bush they are exquisite.

We recall a specimen that stands on the border of a walk near a picturesque bit of rockwork, with green turf and great Norway Spruces in the background. It would be impossible to describe the charming effect this crown of white fringe produces in such a setting. Looking down the vista and beyond, one could almost fancy for a moment that he saw a mass of cirrous clouds floating near the earth. It is worthy of the most distinguished position, not too near the house or other prominent objects, but out on the farther side of a bay of greensward near a background of contrasting dark evergreens.

Plants of the Chionanthus are readily raised from seed, but are very slow in growing to any size. Perhaps the best plan is to graft wood of the Chionanthus Virginica, or White Fringe, on the common ash. What do you think of a strong, straight stem of ash crowned by a great mass of White Fringe flowers. The very vigor of the stock as well as the effect of grafting will throw the buds of the graft quickly into flower and tend to sustain a healthy, rapid growth thereafter.

The habit of the White Fringe is so regular and rounded that it scarcely ever needs pruning, unless some part of it happens to break or become diseased. If you must prune, prune in Winter or early Spring. The Chionanthus is a plant that likes good soil and repays good feeding by extra growth and beauty; but, forced to occupy spots of moderate fertility and even bleakness, it will do quite as well as most other deciduous shrubs.

There are few shrubs that appear well in so many different places. But the slow growth of the White Fringe while young and its ultimate magnitude with age, fit it alike for the small dooryard or extended lawn, while its unique and beautiful foliage as well as flowers make it distinguished in the choicest assemblage of trees and shrubs. We give a portrait of leaf and inflorescence from a specimen growing in the Rural Grounds.

Horticultural.

RURALISMS.

Mr. Bateham, in a back number, speaks of the importance of paper bags for the protection of grapes, and I quite agree with him. There is a question as to which is best for this purpose—paper or mosquito netting, and I rather incline to bags of mosquito netting. There are those who think the bags are a protection against the rot; but this is a very debatable question. There is no question, however, that they are a complete protection against insects. I allude to the subject in answer to inquiries I have seen made, and to say that formerly I used a very light, almost

transparent paper, very tough, thoroughly weather-proof, and liked it very much. Bags made of it will last several years. It was prepared for a different purpose by a new process by a compay in New York, is cheap, and much the best paper I have used for making bags for the grape.

It has often been asked if bees injure fruits, and the answer has generally been, in substance, not if the fruit is sound. My own opinion has been, that if the fruit be ripe, it matters little to the bees and "yellow jackets" whether it be sound or not. The exception, however, has usually been made in favor of the honey bee, and I wish there were reasonable ground for it. A few days since I was in a peach orchard, where peaches, bees, hornets, yellow jackets, etc., were quite plentiful, and I watched the operations of the honey bee very patiently. I saw one alight on an unripe peach, pass all over it, and leave it. I saw this several times repeated. Again, I saw a bee alight on a peach, pass over and around it, and finally stop and begin feeding. When a small puncture had been made I pulled the peach off, and found it to be ripe on the side where the puncture had been made, but there was not the least sign of decay anywhere to be seen. This was repeated sufficiently often to establish it as a fact. It may be that the honey bee prefers bruised and rotten fruit, but it cannot be denied that it is not averse to peaches and grapes that are sound and ripe. I think Mr. Williams could tell us something about this. He is known to have given much attention to the subject.

Times change, and often opinions with them. A well-known horticulturist says, in one of his catalogues (1880), that "he believes he is the first to offer the native grape-vine grown in pots." Knowing how such an announcement had been received in the past, I have been a little curious to see how it would be received in the present, and have waited accordingly. It seems to be generally and silently received as a good way to grow the native vine, and I am of that way of thinking myself. More than twenty years ago, however, when Dr. Grant thought that the best way, and grew nearly all of his immense stock in pots, he was almost savagely abused for it from all quarters of the country. I gather from this that opinions have changed with the times. It may be some comfort to the Doctor, in his helpless old age, to know that vines may now be grown in pots without eliciting undeserved abuse.

Lightning sometimes plays curious freaks. I was at Mr. Williams's nurseries a few days since. A severe thunder shower passed over the place, during which a bolt struck a row of grape-vines about twenty yards from the house. The bolt descended on the end post of the trellis, and broke into numerous little balls, which took to the wires, and ran the whole length of the trellis, several hundred feet long. The post first struck was badly splintered; the second, some fifty feet distant, was split, and the others seemed to have escaped uninjured. The performance on the wires was singular enough. They were cut off smoothly at the first part, and at intervals pieces about a foot long were cut clean out and dropped to the ground. In some places the wire was cut only half through. This was the condition of things for perhaps a hundred feet, and the vines for that distance had mostly fallen to the ground. The fluid passed along the rest of the wires without cutting them. Many of the leaves were burnt to a crisp, and the bunches of grapes along the line of the electric fluid looked as if they had been scalded. It may be that electricity has something to do with what is called "scald" in the grape. The trellises on either side did not seem to have been disturbed, though they were not closely examined. I requested Mr. Williams to note the results, and he will probably be heard from in good time. Much as I have been among vineyards, this experience was an entirely new thing to me. Has any reader of the RURAL met with a similar case? I should hope that this particular application of electricity to horticulture is not to become common.

I noticed at Mr. Williams's that the Champion was the first to color among his collection of grapes, and the Ives next, with but little difference between them. I expected to find the Brighton as early, but was disappointed. Perhaps it thinks itself too good for such company, and could hardly be blamed if it did. Lady Washington was among the absent ones.

JUST now (August 6th) a peddler is canvassing the suburban districts around New York (and perhaps other places) for the sale of lily bulbs. He has badly executed pictures of impossible lilies, which, he says, have just been discovered in California "at a great expense," and have never before been offered for sale. He is quite safe in saying that lilies like those in his picture have never been offered for sale. Fortunately, there are only three of them, and for these he only asks the modest sum of three dollars and a half, but is willing to take two rather than lose a customer. In one place he sold six dollars' worth and in another ten. I have just said to a friend in his hearing: "The pictures are absurdities and the whole thing looks like a fraud. You had better let the man alone." And this she did; and this is what all the readers of the RURAL should do who may be waited upon by this man or his associates, for there are generally several of them.

THE effects of the drought on our forest trees have now become very plain. In almost every direction I see dead and dying trees that look as if they had been burned over with fire. Even the Coniferæ have not escaped, and, singularly enough, the pines have suffered more than the spruces. Lawn trees in some places have suffered greatly, especially transplanted evergreens. Of the latter put out last Spring more than half are dead, or so much injured as to be worthless. Transplanted retinosporas, so far as I have seen, have suffered least of all, a circumstance very much in favor of these graceful and beautiful evergreens.

[They *are* graceful and beautiful, and no reader of the RURAL should select evergreens for his grounds without looking over specimens of the many species and varieties of the retinosporas now to be found in all good nurseries.—EDS.]

A WRITER in a cotemporary says that insects are not troublesome to window plants at this season of the year (July and August). His experience has been singular as well as happy, or he has some magic remedy to keep them down. Window plants at this season of the year are like all other plants in regard to insects and enjoy no immunity from the pests at any time. It is better that those who grow window plants should know this, as they might not otherwise give that attention to their plants which they at all times need. The successful culture of window plants involves an almost daily contest with the "bugs."

HORTICOLA.

JOTTINGS.

BELIEVING, as I do, in calling things by their right names, I must take exception to the word *staminate*, as applied to the flower of the Primo strawberry. I claim there are three kinds or classes of strawberry blossoms, viz.: staminate, those with male organs only; pistillate, those with female organs only; and hermaphrodite, those having both stamens and pistils—in other words, both sexual organs.

The first are barren or unfruitful of themselves and are only useful in fertilizing the flowers of the second class, while the third class which I call *perfect*—an easier and more expressive word—are not only capable of fertilizing their own flowers, but the pistillates also render the first class unnecessary. Hence, for all practical purposes we have no need of any but the pistillate and perfect-flowering varieties, the latter being most desirable, and the merest tyro in strawberry growing should know that pistillate flowering varieties should only be planted in connection with, or in close proximity to, some perfect-flowering variety to secure satisfactory results. I may not have stated the case with botanical precision, but I hope I have done so sufficiently plainly to be understood.

I LIKE the way "Horticola" "goes for" the potted plants. There is a good deal of humbug about them. If left too long in the pots, so as to fill them with roots and become pot-bound, the ball should be broken up and the roots straightened out when set, otherwise they are far inferior to good layers. If one has plants of his own growth near the new bed, he has no need of potted plants. If our berry-basket makers would give us a narrow, three-splint basket, just sufficient to hold the earth about the roots to be set out with the plants, they would be far preferable to pots. Here is a chance for a new "boom." The box boom of two or three years ago failed, because the boxes were too small and not deep enough, and instead of rooting the plants in the boxes, for which there was no room, they were in some cases I know of dug up and set in the boxes for shipment, with many of the roots outside.

How prone we are to forgetfulness! The well-eared cut of corn embellishing the cover of the "Book of Ensilage," by Dr. Bailey, struck me as familiar. I thought it a reproduction of the "Judson Branching" *humbug* of a few years ago, till on reference I found to the contrary. Still I could not divest my mind of the idea that I had seen it before, and wondered how so prolific a variety could have been originated and brought to such perfection, at "Winning Farm," so quickly and quietly; but thanks to the good RURAL this week for solving the mystery. I have been much interested in the ensilage question, and as I hurriedly glanced over the pages of this book, I was and am still puzzled to know what was the *chief* object of the book, and which most to admire, the handsome frontispiece of the author, the ensilage matter, or the method employed to give the "Winning Farm" stock a first-class advertisement. I was most interested in the ensilage matter, however, and I have been thinking how baling the ensilage, either whole or cut, would answer before putting it in the silos, with care to pack closely and leave no vacant places—would it succeed, and what would be the advantages or disadvantages? Who will answer?

THE war with weeds waxes warm this dull weather. In May and June the elements were in our favor, and if it was hot and dry it was a pleasure to kill weeds. Since July 4th it has been harder work, with less pleasure attending it. They are more persistent; if hoed or pulled up to-day, a shower to-morrow will enable them to look up and laugh at you. Excessive and persistent vigilance is now essential to their destruction. The importance of taking them as soon as they appear above ground, or a little before, is every day apparent, and if taken in time, the labor is as one to ten if neglected. A few days' delay gives them the advantage, and you are at their mercy.

Farm Topics.

WESTERN FARMING.—XII.

W. I. CHAMBERLAIN.

Bonanza Farming.

EVERYBODY has heard of the Dalrymple wheat fields in Dakota, or of the Dalrymple-Grandin Estates, or of the Cass-Dalrymple or the Cass-Cheeney farm. And there is an impression that they (or it) are somewhere along the Northern Pacific Road, or have something to do with the "Jay Cooke fiasco." But there are so many names that people's minds are like the Scotchman's "a' a muddle." There is considerable Dalrymple in it all, but just how much, no one seems to know.

I was very glad, therefore, of a chance, yesterday, to visit the farm, see the wheat fields miles in extent, examine the machinery used, and have a full conversation with Mr. Dalrymple himself, who very courteously answered my many questions, and gave me a systematic outline of the whole business. I will try to give, as exactly and with as little varnish or enthusiasm as possible, the facts and figures I gained from him.

The entire estate is properly known as the "Dalrymple Farm," and is a partnership affair. Originally, as I understand it, (though I did not think to ask Mr. Dalrymple about this point), the Messrs Grandin and Cass and Cheeney, non-residents, furnished most of the cash capital necessary for the purchase and outfit, and Mr. Dalrymple furnished his presence on the ground, and the brain capital necessary for the personal oversight and general management of so large a farming enterprise. The total of land owned is 75,000 acres. The total now in wheat is 25,000 acres. For convenience of management and division of profits, the immense farm is separated into divisions known as the "Grandin Farm," "Cass Farm," and the "Cheeney Farm," etc., respectively named for the non-resident partners. In each of these Mr. Dalrymple is half-owner, and sole-owner of the "Alton Farm." The Grandin Farm is several miles north of Fargo on the Red River of the North. The others are west of Fargo on the line of the Northern Pacific Railroad. Each of these large farms has a separate superintendent and book-keeper, and all supplies for each farm are drawn on a regular system of requisition like that used in the army. The expense accounts are all itemized or classified, and each item entered under its appropriate heading. Thus there are separate columns for "breaking" the turf, for "backsetting" it, for seed and seeding, for harvesting and thrashing, for board of hands, etc.

Thus it may readily be seen what is the total cost of a given crop per acre or per thousand acres, and what is the exact cost of each item that enters into the account. Thus, too, as soon as thrashing and measuring are done and the account footed, it is known what is the exact cost per bushel on board the cars. This exactness in accounts is essential in managing so immense a farm. Wouldn't it be a nice thing on some of our smaller farms at the East? Many "small" farmers keep their accounts on the plan of the river-man who took a raft of lumber down to New Orleans. "Look a'here, boss" said he "I had jes' fifteen dollars when I started and here's my pile now," (showing a handful of quarters) "that's how I kep' my 'counts, and that's how much I made," Farmers who have kept their accounts on that system of double entry sometimes find "how much they have made" when the sheriff sells them out.

Each of the large "farms" is divided into subdivisions of about 2,000 acres each, and placed under a division foreman, and he, in turn, has several gang foremen, or riding bosses, under him. Thus all the men, bosses, foremen and superintendents of the whole 75,000 acres, are under Mr. Dalrymple himself, who is general-manager as well as more than half-owner of the whole.

The cost of opening and stocking one of these large grain farms, including buildings, household goods for superintendent and work hands, and teams and machinery, is about $10 per acre, or $20,000 for each large division. This does not include breaking, and there is no fencing. Small farmers are apt not to provide for this expense, essential in starting a farm, and to cripple themselves more or less in consequence. The buildings consist of a house, barns and sheds for stock and implements, and a large yard or corral surrounded by a tight, high board fence for the stock to sun in, in winter time. The stock, machinery and hands used for working the 25,000 acres now in wheat, are as follows:—500 head of horses and mules are owned and 200 are hired, and in harvest and thrashing 800 men are employed, including teamsters. Only cows enough are kept to furnish necessary milk for use. The machinery used is as follows:—about 175 of John Deere's gang plows, or one for each four horses; 500 pairs of Scotch harrows, and half as many Buckeye seeders, or one of the latter for each 200, and one of the former for each 100 acres; also 155 self-binders, of the Wood and the McCormick make. Twenty-six steamers do the work of thrashing, most of them using the Buffalo Pitts separator, nine of the engines being Ames's straw-burners. These use straw for fuel, and have a self-feeding arrangement. They prove to be a success and are a great saving where fuel is scarce and the straw is deemed of no account and is burned on the field at any rate. The harvest takes about 12 or 14 days and the thrashing is begun as soon as the harvest has been in progress five days, that is, long enough to have that first cut dry enough for thrashing; and continues about 24 days. The self-binders are run in "gangs" around immense fields of a mile square or so, a dozen or twenty being run one after another, the latter number being deemed about the limit of successful work in gangs. Each gang of self-binders has a mechanic, and a gang foreman or riding boss, and men enough to shock the wheat as fast as it is bound. In case any machine gets out of repair, it pulls out into the open space for repairs and the other machines pass on, and the mechanic, with supplies close at hand, promptly makes repairs. There is usually at harvest time an expert from each of the manufacturing houses (Wood and McCormick), and any serious difficulty with any machine is submitted to him.

As I have said, after the harvest has been in progress five days, the thrashers begin. The wheat is not stacked at all, but thrashed from the shock, the usual dry weather of harvest in this region favoring this. Each thrasher turns out about 900 bushels of wheat per day, the straw being short and dry, heads well filled, and the days long. Thus the 26 steamers would turn out over 23,000 bushels of wheat per day, or enough to load 60 freight cars and make two pretty long freight trains per day, the two with their engines stretching a third of a mile. Thus the 24 days' thrashing would give us about eight miles of freight trains full of wheat. Or, to figure it in bushels, 23,000 for 24 days give us over 500,000 bushels. Or, in still another way, 25,000 acres, at 20 bushels per acre, give 500,000 bushels. That was the yield per acre last year, and Mr. Dalrymple says it will be, if anything, a little better this year. To get at the magnitude of this crop turned out by the brain power and systematic energy of a single man, we need only remember that the combined wheat crop of Ohio and Illinois for 1879 was 80,000,000 bushels, and that both the acreage and the yield per acre were exceptionally large that year, especially in Illinois. And yet 160 such farms as this that is managed by a single brain, would produce as much wheat as these two great States, the largest in population and about the largest in wheat production, of all the great Western or Middle-western States.

But it will be noticed that of this vast estate of 75,000 acres, only one-third, or 25,000 acres, are now in wheat. Since the first experiment was made, some eight years ago, which proved that this land was remarkably adapted to producing large crops of the best wheat, the system has been to "break and backset" 5,000 acres each year, and the next year sow it to wheat and add it to the previous wheat area. Thus, last year there were 20,000 acres in wheat; this year there are 25,000, and next year there will be 30,000, and so on. At that rate it will be ten years before the last acre of prairie turf is turned.

The season's work on this great farm is somewhat as follows:—Harrowing and seeding to wheat begin almost before the frost is out of the ground, usually before the middle of April, and last for two or three weeks. The ground has all been "backset," that is, plowed the previous fall. Then comes the breaking of prairie turf, which continues till nearly harvest. Next follows haying for a few days, to

furnish about a thousand tons of hay, more or less, for the teams. Then come harvest and thrashing when all is rush, and, last of all, is the "backsetting," or stubble plowing for next year's crop. The turf first plowed in early Spring, becomes so far rotted that it is as far as possible backset before harvest, and by Spring it is rotted enough to be worked with a harrow and raise good wheat. Instead of the plow, after the first breaking, some are using a remarkable machine of new principle and new invention, which does the work of cutting the tough turf to pieces, it is claimed, better and faster than either plow, harrow or cultivator. It is called the Chicago screw harrow, and is, in effect, two huge, short, horizontal augers, which worm their way into the turf or soil horizontally and cut and turn a succession of fine furrows or slices. It is a gigantic hashing machine, and is worked by four, or even six horses, and on our Western prairies seems likely almost to work a revolution in agriculture. I have examined with great care its construction and its workings in many parts of the great West, and must speak more fully of it at some future time, as well as of some other implements and machines peculiar to that section. This machine, however, is not in use on Mr. Dalrymple's farm, but on Mr. Steele's and several others near Bismarck.

Such, in brief, are some of the facts in regard to the Dalrymple farm, probably the largest of any in the world, whose minute details are under the management of a single brain. I have given them unvarnished and without enthusiasm. A hundred questions suggest themselves. Can this thing continue? Will so huge an estate hang together, or will the genius of our free institutions and our lack of entail laws soon dissolve it? Do the climate and the character of soil along the Northern Pacific favor large in distinction or opposition to small farms? Are there many large farms here? Do the large farms and farmers have a tendency or a desire to crowd out the smaller ones? Is there land and room enough for all, or have the best land and the most desirable locations all been taken? What can farmers do in these high latitudes in Winter? Can they live there at all? Can they raise Timothy, or clover, or garden vegetables, or fruit, or keep stock profitably? Are freights ruinously high? How many and what railroads give access to these wonderful Dakota wheat lands?

These and other questions I may try to answer in future in these columns.

COUNTRY LIFE.

Observations Among Rural Subscribers.

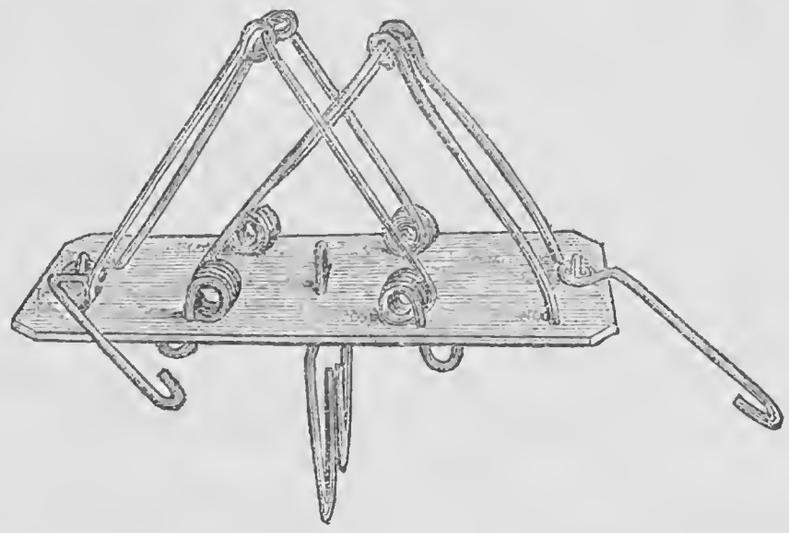
COL. F. D. CURTIS.

THOROUGHNESS is the foundation of success with John F. Bell, who inherited the characteristic from Scotch ancestors. With this idea as a governing principle, the farm of Mr. Bell has been underdrained and made fertile. The making of manure has been a leading aim, and such stock have been kept on the farm as would produce this result, and at the same time afford the largest profit. A number of cows are kept, carefully selected for their actual worth in the dairy. The making of butter has been reduced to such a system that a perfect uniformity in quality has been established. The excellence of Mr. Bell's butter enables him to sell it to one grocer in the city of Albany, who purchases it for some of his most particular customers, who are willing to pay liberally for a good article without regard to the current market rates. This special demand enables Mr. Bell to contract his butter at one price the year round. It is delivered at regular intervals, and the cows are fed and managed so that the yield is steadily maintained.

Mr. Bell does not hesitate to supplement the supply of food by purchasing more, if by reason of drought or other causes there is any lack. He does not believe that it pays to winter cows and then stint them in Summer. Under the above wise management, Mr. Bell's dairy affords a profitable income.

This is not all; plenty of manure lays a foundation for another source of income. A good crop of corn is kept over to furnish the means for fattening a number of pigs, which are well started by skim-milk. A choice flock of coarse-wool ewes also furnish an additional income. The lambs come so early and are so well fed that it is a common thing for Mr. Bell to get from $1 to $1.50 each for his lambs more than do his neighbors. His ewes being large and strong, often yield double their number of lambs. Clover hay is the basis for sheep feed, which puts the mothers in almost as good condition as grass, and also furnishes healthful and nourishing food for the lambs. The clover is cut while it is in blossom and carefully cured, so that the leaves do not drop off. Clover hay, Mr. Bell thinks, is indispensable for early lambs, and almost indispensable for good farming. He thinks that its importance in the rotation of crops is also overlooked, and as a renovator to the soil.

On a farm so thoroughly tilled and so productive as Mr. Bell's, there necessarily will be a large amount of straw and other coarse feed. Instead of selling this at a low price, or feeding it to young cattle, which would require a large range for pasturing in the Summer, Mr. Bell, like others of his neighbors, has been in the habit for years of wintering horses and



MOLE TRAP.—FIG. 266.

mules used on the canal. The average price paid is $1.00 per week, which is equal to $8.00 per ton for hay, if they should be fed exclusively on it. The usual practice with these animals, which are mostly mules, is to give them hay in the stable in the mornings, and then turn them into a yard during the day, where there are racks in which they are fed straw and corn-stalks, which they readily consume.

At night they are again fed in the stables either hay or straw. Under this system, Mr. Bell disposes of his coarse feed, supplimented with a little grain, if necessary, and converts it into manure, which is available for any crop. This system of wintering stock allows him to have more meadows and land for cultivation than he otherwise would, and fills his barns, which in turn feed the fields, thus not allowing any depletion of the soil.

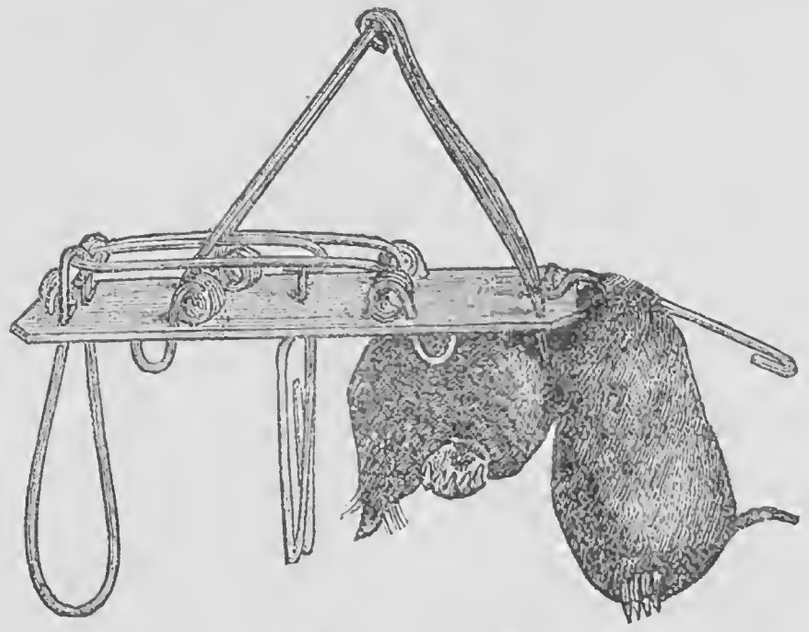
Another Mole Trap.

What seems to be a simple, inexpensive and effectual machine for catching moles is shown in the accompanying illustrations which we take from a late number of the London Live Stock Journal. It explains itself. Appearances in mole-traps, as we have found to our cost, are *very* deceptive and reliance can be placed upon actual test alone.

Farm Economy.

THE WESTERN AND SOUTHERN MANIA FOR BUYING IMPLEMENTS, ETC., ETC.

ATTENTION has been repeatedly drawn to, and mention made of, the extraordinary mania for buying agricultural implements and machinery and similar articles of many kinds now prevailing in the West and South, and especially in that portion of the South not far from the Mississippi River. But this frantic desire for the possession of that kind of property is chiefly confined to farmers, as a matter of course, but the sale of cheap carriages and furniture to all sorts of people, shows the mania is not wholly confined to these. It is estimated that the total value of the Winter wheat crop in the southern half of Illinois, for the present year, has been fully absorbed in the purchase of agricultural implements, tools and machinery, including wagons and carriages, within the last three or four months. While the main sales have been of tools related to the wheat and small grain crops, such as self-binders, self-rakers, thrashing machines, grain-drills and the like, the call for steam engines, improved plows, patent harrows, heavy and light wagons, cheap and fancy single and double buggies, stylish farm wagons, etc., etc., has been such that dealers and manufacturers have had more than they could do to supply the demand. Indeed, it has been demonstrated that, could all the orders for reaping machinery have been filled in season, from a quarter to a half a million dollars' worth more would have been sold in Illinois. And while a small part of these purchases only have been made for cash, one-half of them have been by parties for whom they are a good investment, leaving for the other half a burden which, in the light of present circumstances, seems to have been unnecessarily assumed. And to such an extent does this feeling prevail among dealers and manufacturers, that they are free in their expression that half the farmers of the country seem bent on ruining themselves in the purchase of what they do not really need.



MOLE TRAP.—FIG. 267.

At first thought it is difficult to give a sufficient reason for the existence of such a state of affairs and it is not till one has looked over the ground pretty thoroughly that he can satisfy himself. But in reviewing the agricultural history of the State since the war, one can find many causes which have operated to bring about the present condition of things. During the war and for a year or two thereafter there were great profits in farming, and every farmer who went into trade and bought land, or goods, or stock, and sold again, made much money. These first successes stimulated larger ventures and these were made, and in making them they came to be made public, and everybody who could borrow a dollar or buy on credit, invested to that extent.

Then came the crash of '73 and found two-thirds, if not more, of the farming community deeply in debt, and a half of those hoplessly so. Then followed a series of crop failures, and it became a struggle for all to keep their heads above water, and a desperate one for many, for what little surplus there was went to pay accumulated interest and to satisfy mortgages and trust deeds. But many went down, abandoned their farms, went West to start again and grow up with the country there. And the extent of this forced exodus is well shown by the returns of this census, which report little or no gain in proportion in many counties between 1870 and 1880. But the crops grew better than in 1876, especially the winter wheat crop, which had been practically abandoned for nearly twenty years. A tolerably good one of this cereal was made in 1877, and in 1878 came the phenomenal crop of this century, and the full blaze of agricultural prosperity burst upon the West in the abundant yields and fair prices along the whole agricultural line.

The profits of this year were used, as far as might be necessary, to pay off old debts, whether of arrears of interest or contracts for land due; but a large share was reserved for new purchases in the line of clothing, furniture, and everything of personal need and necessity, which five or six years of bad crops and hard times had prevented folks from keeping up to the average wants of life and living. Hence the remarkable start and continued stir of business, beginning at this time last year, and hence the business "boom" which invaded the entire country, until the profits made on the crops had been spent. There had been great and abounding crops for which fair prices were obtainable; the farmers received the money and spent it liberally, and the dullest even were made to see that the prosperity of nations depends on a prosperous agriculture.

Now we come down to the events of this year. Notwithstanding the unfavorable character of the Winter, they got abroad that not only had the Winter crop area been largely increased (which was true), but the yield would surely be equal (which was false) to last year's. Remembering the difficulties of harvesting last year, the difficulty of obtaining hands, and the losses to the crops in consequence of delay in doing harvest work, and with the hope and expectation of small grain crops equal to the previous year's, common consent seems to have been given to the idea that the only safe course would be to meet these wants by increased machinery. Those who really needed such assistance and were able to obtain it, started and made these orders first, and then the whole country-side followed their example, and the result is as we see, a very mania for crop producing, as there was for stock and land during, and for some time after, the flush times of the war. Should fair prices continue to be received for the Winter wheat crop of this year, which in the Winter wheat requires something above an average, but not at all equal to that of last year, and should the corn crop come out as well as promised, the burden of debt imposed upon farmers will be partially thrown off this year and one or two equally good crops to follow will relieve them of it altogether, and the country be no worse for the apparently foolish investments.

The business men and the small manufacturers having had their "boom" last year, and the machinery and agricultural implement makers having had theirs, then, it is interesting to consider who will get their turn next, or in what direction the money, the proceeds and profits of crops, will be invested, should the Winter wheat crop of '80-'81, turn out to be a good one, and other crops and prices equally good. To one acquainted with the country the answer is easy, or apparently so. The next form of popular expenditure will take (the need and desire for more land and more tools having been satisfied) the direction of building and the repairs of dwelling houses and farm structures, and improvements of many kinds, some of which will tend to the æsthetic side. The old idea that having money, the farmer should hoard it or put it out at interest, and in that way suck the life-blood of his fellows, has been to a certain extent abandoned and left to the Jews, the bankers and men of that class, the new idea being that if a man has money he should spend it in his surroundings, and spend freely that which he has honestly and laboriously earned. This is the temper and the spirit which have made such surprising changes in Illinois within the last few years, and this, if continued, will make it in the course of time that which, considering all its advantages, it was originally intended to be, the garden of the country, in respect to a profitable agriculture in the heart of the modern world, and in respect to many other things.

Champaign, Ill.

CORN SUGAR.

THE following brief statement of fact in regard to a subject which is now attracting a large share of attention, will perhaps interest some of the readers of the RURAL and correct some mistakes.

In 1876 I published a condensed account of experiments which I had made that year in manufacturing sugar from the juice of Indian corn stems, adopting a new line of research. I had previously exhibited at the Centennial Exhibition, a few days only before its close, specimens of the sugar so made. These results, as then published, were to the effect that under favorable circumstances from 1,500 to 2,000 pounds of sugar per acre of ground planted, could thus be obtained from the juice of common field corn; that the sugar so made was true cane sugar; that it existed in the plant juice in peculiar combination and in large quantity from the time the corn passed the flowering stage until the stalks and the ears were ripe, and that the largest yield was when the ears were but partially mature. These statements were reiterated by me at the St. Louis and Elmira Sugar Conventions of 1878, and in various periodicals. Tests the most thorough and conclusive, made with scientific precision by the Department of Agriculture at Washington, in the use of the process which bears my name, confirmed in every particular the statements which I had made as to the entire practicability of producing sugar cheaply from the juice of Indian corn. The fact that a *double crop*, consisting of 1,000 pounds of prime sugar and 69 bushels of ripe shelled Dent corn to the acre, was obtained by Prof. Collier, the chemist of the Department of Agriculture, ought to open the eyes of our

Western people to an interest to which they have heretofore been blind. But these investigations have by no means ended here. In the fall of 1877 I established the fact that sorghum cane of every variety known to us in Pennsylvania yielded its sugar with invariable certainty when treated according to the method by which it was obtained from corn stems. These results the chemist at Washington has also fully confirmed, and the same were obtained by practical men last year in different sections of the country. Accurate estimates have been made showing that the entire cost of growing the corn or cane and producing the sugar in this way does not exceed 2½ cents per pound of sugar.

These statements are either true or false. The time is now close at hand when they can be either disproved or more fully verified. If they are true, they have a significance to which I can give no adequate expression.

F. L. STEWART.

Dairy Husbandry.

THE DAIRY COW—NO. 5.

HENRY STEWART.

How to Feed a Cow.—II.

THE character of the food has much to do with the quality and the quantity of the milk and the butter made from it; although this has been disputed, but never I believe by one who has long been engaged in feeding cows for profit. For it is very certain that certain feeding stuffs have different effects on the product of the cows. Wheat bran and middlings, and rye bran have the effect of producing a dense, rich milk of a yellowish color, and a butter of a deep yellow color, solid, waxy texture, and good flavor. Corn meal has a similar effect and for general use there is no better concentrated food than a mixture of bran or middlings and corn meal in equal parts. Buckwheat bran will increase the flow of milk, but it will be thin and white and the butter will be very white, soft and greasy in texture and disagreeable in flavor. Good butter cannot be made from buckwheat bran, although it is a profitable food for a milk dairy where quantity is more considered than quality. Brewers' grains, corn-starch meal (the waste from glucose factories) and linseed-cake meal have a similar effect. They are for the milk dairy but not for the butter maker or the family cow. Pea meal is rarely to be procured, but when it is, it makes an excellent mixture with wheat bran or middlings in place of corn meal, but it is to be fed cautiously on account of its nitrogenous or heating character. Palm-nut-cake meal is a rich food and has doubled the amount of cream in a careful test made with it, but it does not give a rich color or flavor to the butter, although it is not objectionable if its price were reasonable; but its cost is higher than that of cotton-seed meal. Cotton-seed-cake meal is the best of all concentrated foods mentioned. It has an agreeable flavor when free from husk; it gives a high color to the butter, produces more of it than any other food in proportion to quantity and cost, and is safe and healthful. Its effect is somewhat constipating, and on this account, it is better when fed with malt sprouts which have an effect entirely different. Malt sprouts are very dry and swell enormously when steeped; so that they cannot be fed safely unless in small quantity, or soaked and given wet. But when thus prepared and given with cotton-seed meal and wheat bran in equal parts, the mixture has made the best food I have ever used, either for milk or butter.

For profit, it may be accepted as beyond question, that the more food a cow can be induced to eat, up to a point where the product is no longer increased in proportion, and as long as the cow is kept in good health and vigor, the better it is for the cow's owner. For if a cow gives, when fed on hay alone, four quarts of milk a day and this can be increased to eight quarts by four pounds of bran and corn meal, or to 12 quarts, by eight pounds of the extra feed, and each additional pound of feed after this does not increase the product, then the eight pounds of feed is the maximum quantity that the cow can use productively, and there the feeding should stop. It is not safe to force a cow by high feeding to the very verge of her possible production, as the digestive powers are then taxed to the utmost, and the system is on the utmost tension, when an accident, such as a sudden shower on a hot day, may change the current of the circulation and bring on a serious or fatal attack of fever. It is by such excessive forcing that so many productive milkers are subjected to inflammatory diseases, as garget, milk fever and abortion. It may be different in such a case as when large-framed cows, in a milk dairy, are fed highly with a view to force as much milk as possible, and when the milk falls below a profitable point, the animal is fattened for the butcher. In some milk dairies the daily rations of grain food amount to half a bushel of brewers' grains and one peck of corn meal, with hay or pasture *ad libitum*. But in milk dairies cows are not permanently kept, but are coming and going continually, being changed as soon as the milk falls below the cost of feed.

The general rule in feeding cows is that 27 pounds of dry food are required for 1,000 pounds in weight, and that three-fourths or two-thirds of this should be bulky food, such as hay. This estimate is based on the nutritive value of hay, in which the ratios of albuminoids or flesh-forming substances, and of carbo-hydrates, or fat-forming and respiration-sustaining substances, are equivalent to 1 of the former to 6 of the latter. Of these 27 pounds of dry substance, 2½ pounds of the albuminoids, and 15 pounds of the carbo-hydrates, with half a pound of fat, must be capable of complete digestion.

As the flesh of an animal contains precisely the same elements as pure milk, and as milk is of itself sufficient to support a growing animal and to supply every requirement of its vital function, so the food that will perfectly sustain an animal in health and vigor, is precisely adapted to the production of milk; and those kinds of food which will fatten an animal, will produce fat in the milk. So that we have a very simple guide to the choice of food for cows. In my own practice in feeding cows, I have found the above estimates not sufficiently liberal, and that 15 pounds of the best clover hay, with eight pounds of concentrated food, which is considerably more nutritious than hay, are required for adequate and *safe* feeding for an 800-pound cow. I say *safe*, because a cow will eat more than this, but it will be a dangerous experiment to feed more to a cow than she will consume with good appetite, and healthfully. I would not feed a cow on a high-pressure system, or advise any other person to do it. In many years' feeding of cows, I have never had one case of sickness, never lost a calf, never had more than an easily managed case of garget, inflamed udder, or bloody or thick milk; I attribute this to *moderate and regular feeding*, and watchful care to prevent accident and trouble.

My normal ration is 15 pounds of hay, or 20 pounds of cured corn fodder, and eight pounds of concentrated food. This may be varied as follows, one ration being nearly equivalent to another, so far as regards milk and butter production:

TABLE OF DAILY RATIONS FOR A COW OF 800 POUNDS.

	1	2	3	4	5	6	7
Hay	15	..	..	10	6	10	..
Corn fodder, dry	..	20	..	..	15	..	60 (green.)
Marsh hay	..	..	10	..	..	..	..
Mangels, or sugar beets	..	..	40	..	..	30	..
Brewers' grains	..	..	..	30	..	..	..
Malt sprouts	..	..	..	..	4	..	..
Corn meal	4	..	..	6	..	2	4
Bran, or middlings	4	6	2	..	..	2	4
Cotton-seed meal	..	2	4	..	4	2	..
Total, pounds	23	28	56	46	29	46	68

I have found the best manner of feeding hay is to cut it into chaff, wet it, and mix the meal with it. One bushel-basket of cut hay, thus prepared, pressed down and heaped, makes one ration.

Roots are cut into slices, and either given by themselves or sprinkled with a portion of the meal. Green grass, oats, rye or corn fodder are fed whole, and the meal given dry, or mixed with a small portion of green fodder, wetted, to secure the mastication of the meal. The cutting of the fodder, dry or green, (excepting grass or clover), is equivalent to a saving of one-fourth, so that it becomes a question whether it is better to save the fodder or pay for the labor of cutting it. In general, labor is cheaper than fodder: for if one man at a dollar a day can cut the feed for forty cows, that is equal to 2½ cents a cow per day; and this is the value of 3 pounds of hay at $15 a ton. But one man can cut hay or corn-stalks for 40 cows in four hours, and one man or boy can prepare the food for one cow in six minutes, so that it is cheaper to cut the hay and mix the meal with it than to feed it long and give the meal by itself.

The Poultry Yard.

POULTRY RAISING.

I SET my hens in a quiet place—when many fowls are in one house they make too much disturbance. Fowls naturally hide their nests; they must be made to feel assured they will be left alone to hatch. The larger breeds can be easily moved at night to comfortable quarters where food and water must be at hand. They must be confined a couple of days to become accustomed to their new home. Let nothing disturb them. All movements of their keeper must be slow and gentle. If a hen's confidence is obtained she will be submissive. The large breeds are clumsy and careless; they step on the chickens; of this there is more danger the first few days than during the whole year. I have some common fowls to hatch my very choice eggs. I raise Light Brahmas chiefly.

My practice is to take the chickens away as soon as hatched and keep them in a warm place till all are out. I use a box in my poultry house, four feet square and one foot high without any cover, for two weeks. I use no coops at all. At the end of two weeks I let the hen go as she pleases with her happy family. I watch that she gets all her family in the homestead at night. I use an old crockery crate for my feeding place. Laths or slats driven into the ground three or four inches apart will do as well. I feed ground corn and oats mixed and slightly moistened. The only danger with it is that it sours in a few hours. I prefer this feed to any other, as it is cheap and various in its nutriment. I find that fowls eat less if food is before them all the time—a gill of corn or its equivalent a day is a full ration for the largest fowl. The same principle applies to chickens. When I have to be away all day I leave inside of the crate all the cracked corn the chickens will eat. When they are large enough I keep cracked corn, whole corn, buckwheat screenings and a variety before them all the time. Clear, cold water, renewed daily, should be on hand at all times.

For farmers I recommend Plymouth Rocks—they are hardy and fair layers. The Light Brahmas are the best city fowls. They will not fly over a two-foot fence; they will not disturb your neighbors; they are good foragers; with a large range they will feed themselves during the Summer and Fall. Their chief danger lies in getting too fat. They, as are all Asiatics, are good Winter layers. The eggs of all Asiatics must be set very early in the Spring—not later than March or April. They require the whole season to grow in. If set late the chicks are smaller. The Cochins are less active in their habits and have a propensity to sit. The Black Cochin is the best of the Cochins for general use. The Leghorns and Hamburghs are great layers of small eggs—they lay the best in warm weather. I prefer a variety, say, of Light Brahmas, Leghorns and Hamburghs so as to get eggs the year round. I keep only one kind of cock so as to keep one kind pure.

JAS. H. CAMPBELL.

Lucas Co., Ohio.

Entomological.

OUR ENEMIES, THE INSECTS, AND THEIR CONTROL.—NO. 2

PERHAPS no man of Mr. Pasteur's ability has followed him in his study of molds as causes of disease. Here and there it has engaged the attention of learned men, however. Dr. Bain, a Prussian naturalist, has carried it forward; a few Americans are becoming interested in it; but, if, as surmised and now seems probable, the subject has its practical bearings, it should also be taken up by practical agriculturists. They are not only the most deeply interested, but quite capable of engaging in it, and making more extended experiments to determine its supposed usefulness. The experiments and observations of the writer were confined to the latter portion of the last season, because his attention was called to it too late to make earlier and fuller tests; but in those made there seemed promise sufficient, at least, to merit fuller experiments the present season, and more will be determined when the infected insects come out of the ground next Spring. Among entophytes the yeast plant, perhaps, merits earliest attention, because it is known to be promising in its action as an insecticide, and easily obtained in any desired quantity. The yeast should simply be diluted with water and sprinkled upon the foliage of plants frequented by insects. Beer and any other ferments that suggest themselves should also be experimented with. It may be that calf's rennet, will serve a good purpose. It is, without doubt, of the nature of a ferment; but scientists are not agreed concerning it, some claiming it to be similar to the spores of cryptogamous plants; while some think it of a chemical and others, of an animal nature.

But, doubtless, the spores that can be obtained the most easily and used the most successfully are those that nature herself employs for this object, such as the fly fungus, and allied forms of this and other classes. The dead insects killed by these and other entophytes should be collected, powdered and preserved in years when epidemics prevail—as they often do among insects—for use as insecticides. It will not be difficult to obtain a considerable quantity. Here are the sources of the infection, and the harvest time to secure our poisons. One great fact to be observed in this connection is, that nature seldom commences these assaults upon insect life, until too late in the season for our purpose. It should be man's business to supplement nature's shortcomings here, and be ready with his sporadic infections to assault the smaller numbers of the first broods that hatch in Spring. The object aimed at is not, as is usually supposed, to kill directly, but to poison and infect the parents in such manner that they can lay none but diseased eggs that will again cause the disease to spread among the matured insects.

To illustrate the subject, take, for instance Caloptenus spretus, the locust: one man armed with the sporadic poison could go into Montana, or wherever else the native or original breeding grounds of these locusts may be found, and by infecting the first broods of Spring, so control these insects that they will never increase in sufficient quantities to be able, or rather forced, to migrate to fertile regions to obtain food and scourge mankind. A few trained men could thus control more than an army after the locusts are allowed to increase and migrate. The economy of such method must be apparent to all minds. Of course, it will be understood that the method is probably only applicable to such insects as devour the foliage of plants and consume the spores as they have been scattered upon the foliage; such insects as the chinch-bugs that live by puncturing, and sucking the juices, might not be reached, still the spores are so minute that this is not certain; but by testing, it might be determined that enough could be infected to finally accomplish the desired object.

Even if these methods should fail in these instances, the advantages would not be greatly lessened, for the classes of puncturing insects are small, in comparison to those consuming the foliage or whole substances of plants. As to the diseases of insects above referred to, the topic has been little studied, and there is not much definite information to be gleaned from books, but it has often been observed that insects are very liable to be destroyed or rendered unhealthy from the lodgement and development of parasitic plants upon their bodies. In many instances they have been observed to die by the million from unknown diseases, the dead bodies molding, but it is not always clear that vegetable parasites were the cause of death. What we should take advantage of is the death of myriads of insects under conditions like those when human beings perish of cholera and yellow fever epidemics. We must then collect their bodies and retain and use the spores therefrom as poisons again to produce similar conditions. Little pains are needed to carry the infection of cholera and yellow fever to distant places by means of clothing or affected persons; indeed, the difficulty is to prevent the infection from spreading. The virus may be preserved from season to season, and the diseases caused again and again at will. This is somewhat the condition of things proposed to be artificially used against our insect enemies, let the cause be entophytes or whatever else it may. If we can generate and repeat the disease at will, then scientists may go on disputing as to the causes. Then we could be only intellectually interested, for we would already have the practical application of the facts. But, after all, it may finally be discovered that the diseases are climatic and non-infectious.

D. S. MARVIN.

Industrial Societies.

THE ROYAL AGRICULTURAL SHOW AT CARLISLE, AND BRITISH FARMING.

PROFESSOR J. P. SHELDON.

FOR some time before the date of the Royal Society's show the weather had been broken; the prospects of the show were consequently not very bright, and the result unfortunately bore out the prospects. Two years in succession the Society has been almost drowned out of its own show yard. The Kilburn show of last year became a by-word for rain and mud, and I should be sorry to look upon its like again. But the Carlisle show-yard would have been quite as much a quagmire as the Kilburn one but for this—it was on an alluvial soil instead of on the London clay. My opinion about the London clay is this: it is the stickiest on the face of the earth. Lucky it was that the Carlisle show-yard was on dry land, or it would soon have become impassable, for the situation was a low one; but as matters stood it became very dirty by the end of the second day, at which time I had had quite enough of it. The weather at the Kilburn show caused the Society a loss of about $60,000, and though the people of Cumberland are not so much afraid as those of Middlesex of being dissolved by rain it can hardly be otherwise than that the Carlisle show should be a financial loss to the Society. A few more disasters of this kind will cripple the Society, unless other means are resorted to for filling its exchequer.

In all other respects than those which had to do with the rain, the show was a success. The animal classes as a rule were well filled both in the matter of quantity and quality. The Short-horns as usual were present in numbers, showing on the whole no falling off in quality as compared with former years. I have seen individual animals in greater numbers and of higher merit, perhaps, at some of the Royal shows, but on the whole the Short-horns at

Carlisle were a highly creditable lot. There were also many excellent Herefords, Longhorns, Devons, etc., but, strange to say, there were none of the famous West Highlanders—the best beef-making breed of cattle the world has yet seen, so far, that is, as quality of beef goes. The two other Scotch breeds, the Ayrshires and the Polled cattle, were, however, well represented. In my opinion the polled cattle made the best show of any of the different breeds, so far as evenness, quality, and general intrinsic merit are concerned. These cattle, especially the Norfolk branch of the family—the red-polled Norfolks and Suffolks, as they are generally called—are rising into popularity at a rapid rate. I consider they ought to, for they have many excellent qualities, not the least of which is the negative one of hornlessness. Being excellent beef-makers, and having no horns, these cattle would suit your shipping trade to this country better, perhaps, than any other kind.

The sheep classes were quite equal to those of former shows, and the different Down breeds were very well represented, specially the South and the Shropshire Downs. The last named are rapidly coming to be the most valuable breed of sheep in these islands, and the white-faced, long-wooled breeds — the Leicesters, Cotswolds, Lincolns, etc.—are doomed to become less thought of than they have hitherto been. It is the question of quality of mutton which is bringing about the change in public opinion in respect of the different breeds of sheep. Wool, you see, can easily be grown in distant countries, and the sheep stock of the world is increasing in numbers, so that we no longer in England can look on the production of wool as a specialty in which we excel. Wool, in fact, like wheat, has ceased to be a leading mainstay in British farming. We cannot afford to go in heavily on either of them at present and prospective prices. Hence it follows with regard to wool, that we are compelled to attach more importance than we formerly did to the question of quality of mutton. Now it happens that long wool and inferior mutton go together, while the short-wooled breeds produce mutton of superior quality. The Leicester mutton is much too fat, the Lincoln too coarse, while the Cotswold is too commonplace in quality and repulsive in flavor ever again too find much favor in the estimation of the English public. Hence it follows that the Down tribes of sheep are rising rapidly in the scale of merit; and as the Shropshires are large sheep, very fertile, and highly practical in all respects, they are rising fastest of all.

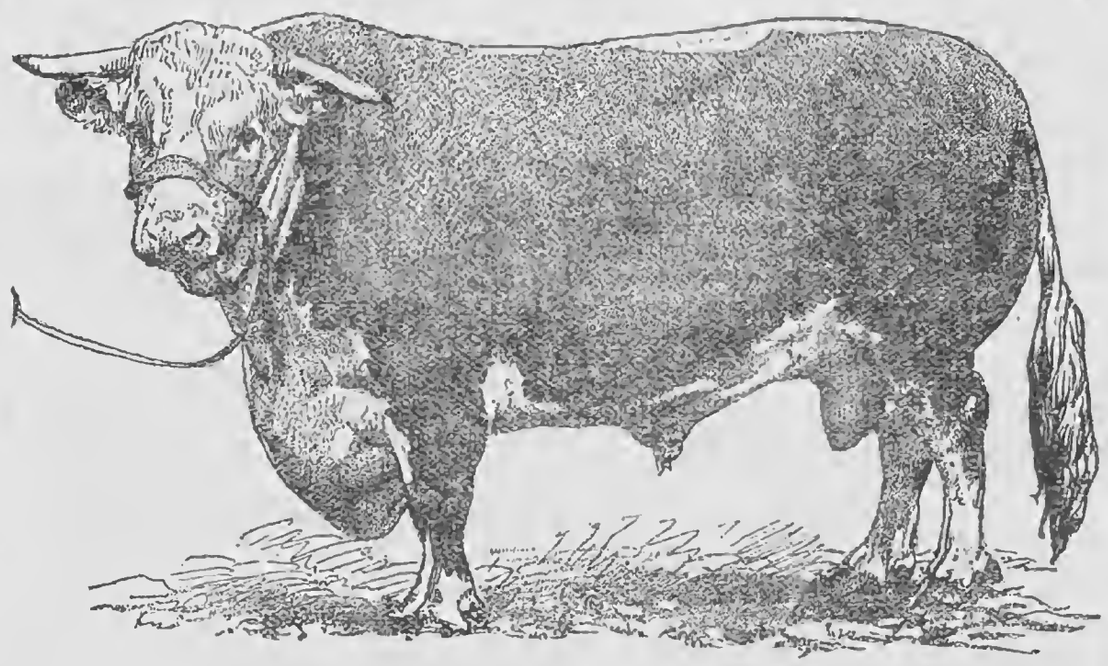
The prospects this year of profit to English farmers are very poor indeed. It is now certain that we shall have a season only a degree or two less disastrous than that of last year. A great deal of hay has been spoilt, and some of it carried bodily away, by the floods of rain which have been so common of late. Mr. Mechi tells us that on heavy land the roots of winter wheat are rotting in the ground, and though the crops, as a rule, are bulky it is probable that the quality will be inferior. All the mischief is owing to want of sun and warmth, of brightness and dryness of air, and to the huge downpours of rain. Cows are milking badly, and the yield of cheese will be one-fourth or one-third below the average. Prices of cheese, it is true, are pretty high, but they cannot make up for the shortness of the make. In fact, if English cheese-making is to pay in the future, we must have present prices maintained, in conjunction with good average yields. Another thing is certain: we cannot afford to grow wheat at 4s, 6d a bushel, unless we can average more than 30 bushels an acre. Nor, indeed, can we grow wool at 1s a pound, or beef at 7d, or cheese at 6d, or butter at 1s, if we are to pay our way and live—unless, indeed, we have productive seasons of a very different order from the last two or three.

But, after all, it is a great thing for our general population that food is cheap; farmers, of course, are suffering, but the poor are fed; landowners are in sore straits in many cases, but those who own no land are neither slaves nor paupers for that reason. Despite the things I have been discussing, it is probable our farmers on the average would be as prosperous as yours are, if only the seasons did not fight against them, and we must hope for and expect a change for the better so far as the seasons are concerned. Our farmers have this advantage to balance high rents and taxes and bad seasons viz., they sell in the dearest and buy in the cheapest markets in the world; that is, their produce makes the highest possible time's price, while they buy their implements and general manufactured goods at very reasonable rates. All this we owe to Free Trade, for our people are not taxed, as yours are, in order to bolster up the manufacturing classes; we do not make them pay 30 or 40 per cent. too much for what they have to buy, in order that our own producers shall reap the advantage of a monopoly. We believe in fair play and no favor, with justice to all classes alike, and we know this system will win in the end. It is odd to me that your farmers do not demand fair play from the government.

Sheen, Ashbourne, Eng., July 27.

THE ROYAL AGRICULTURAL SHOW AT CARLISLE.—(Continued.)

At "Royal" shows riding horses always make a fine show in fine weather, but the wet

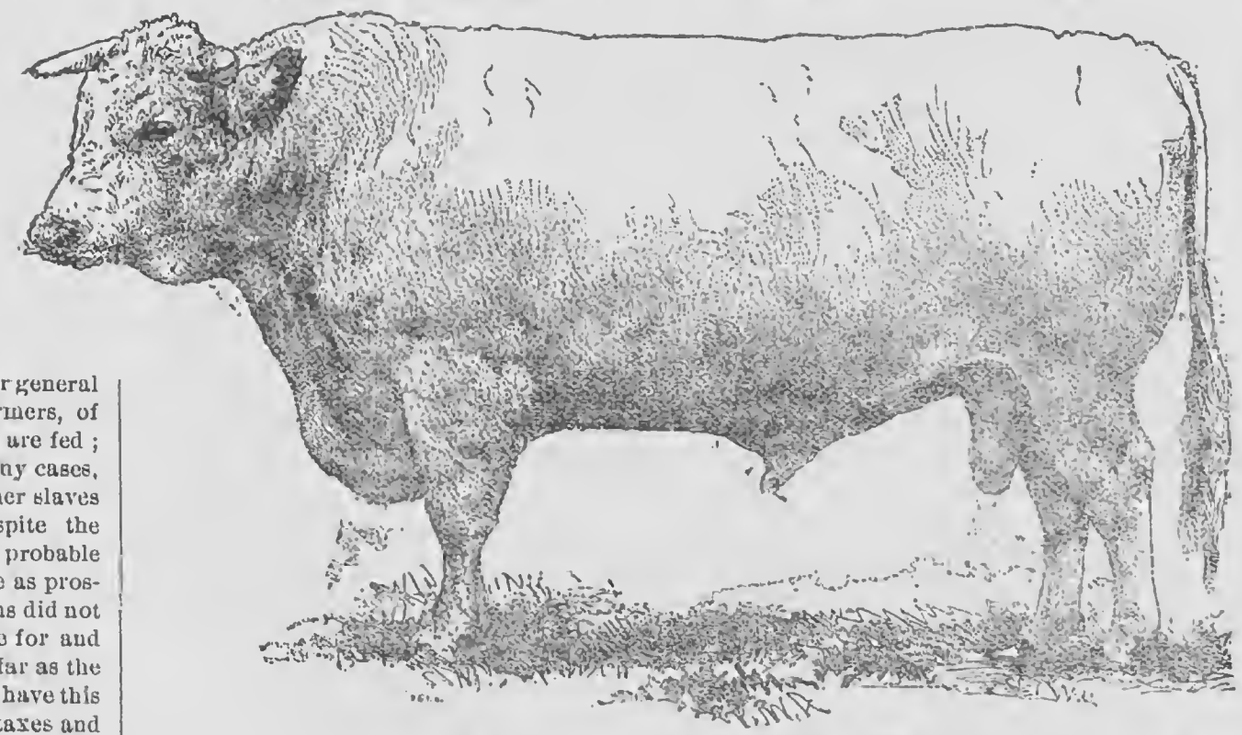


HEREFORD BULL GRATEFUL, WINNER OF FIRST PREMIUM AT CARLISLE.—FIG. 258.

at this prevented a good display in the ring, where their points and beauty are best exhibited. Thoroughbred stallions suitable for breeding coach horses; mares of the same classes; ponies and heavy-weight hacks, male and female, made up a number of different classes each of which had a host of admirers.

Short-horns made a display fine enough to delight their host of friends. In the class of bulls above three years old, the first premium, not a little to the surprise of old fair-goers, for once slipped by the veterans Vice-Admiral and Rear-Admiral, first and second prize bulls at the Kilburn show, and fell to a lot of a comparative outsider, the Duke of Howl John, which also won the premium offered for the best bull at the show. He is a six-year-old, white beast, with fine top, excellent quarters, great length, strong middle, and of beautiful symmetry, his only blemish being his somewhat rough shoulders. He is the property of Mr. John Vickers, of Crook, about a dozen miles westward from the old city of Durham. Although a comparative stranger to the general public, he had already won about thirty prizes and cups, principally at local shows, and will certainly be heard of in national exhibitions in future. For cows in calf or in milk and above three years old, Mr. Hutchinson's Grateful took the first prize, while in yearling heifers, Lord Fitzhardinge's Wild Eyes 15th took the first honors from 32 competitors. [Both of these have been pictured in the RURAL NEW-YORKER; the first last Summer, and the second last Spring.—EDS.]

Herefords, though comparatively small in number were of excellent quality and headed by the famous "adult" bulls Grateful and Thoughtful, which were also the chiefs of the breed at Kilburn. Grateful, after having been defeated by his opponent at the last three



SHORT-HORN BULL, DUKE OF HOWL JOHN, FIRST PREMIUM WINNER AT CARLYLE.—FIG. 269.

shows at which they were exhibited together, has won a signal triumph here. In this country, while the high appreciation of Short-horns is universal, that of Herefords is merely local, being confined mainly to the county from which they derive their name and the neighborhood. They mature early, however, make prime beef, laid on heavily on the best parts, and thriving best on grass, they should be excellently adapted for raising on your Western plains cross-bred, or "grade" animals, which made a better show here than their near relatives and neighbors, the Jerseys. There was also a fine show of polled cattle, belonging to the various hornless breeds, which are certainly advancing in public favor Ayrshires were few in number and not specially distinguished for quality, while the other breeds shown possessed little or no interest for trans-Atlantic readers.

W. L. H.

Various.

HUMBUGS AND DUPES.

I CORDIALLY indorse the RURAL'S sentiments regarding pictorial exaggerations, page 492, and yet the cause of these exaggerations rests in a great measure with buyers. One can hardly induce the average man to buy a new variety of fruit, grain, etc, unless its merits are rather overrated. In fact, I am inclined to think that the majority of mankind rather enjoy being deceived. Persons often say to me, "We think of engaging in fruit culture; do you think we could do so with profit?"

If I answer truthfully that with experience, persevering industry, good judgment in marketing, etc., etc., he will probably make fair (not large) profits, he will walk away as if he disdained all such counsel, saying plainly by his looks, or at least by his actions, "That man is little better than a fool." But tell men of this kind that fruit-growing is nearly all profit, that apples will pay six to eight hundred dollars and grapes yield seven or eight tons per acre, and strawberries eight to ten thousand quarts, etc., etc., and they march off highly elated, and will report that their informant is a man of wisdom and experience.

When we inform people that the grape vines they are talking of buying will, with good care and culture, produce a light crop the third year and a full one the fourth or fifth, we have probably lost that sale; but tell them that these vines will bear next year, that three or four vines will supply their family, and how quickly they buy!

I hardly know whether or not it is morally wrong to unseal the eyes of these self-blinded people. Those oily-tongued agents that perambulate the country selling humbug fruits at swindling prices, are doing some good. Men who buy of them would not be likely to purchase a good variety of fruit at a fair price of an honest dealer. "If there were no fools in the world, knaves could not live." Many a successful fruit grower has had his interest first awakened by some of these exaggerations, pictorial or otherwise. The beginning was a fraud, the ending a success.

In connection with this subject I quote the words of Butler:

"Learned men often greedily pursue
Things that are rather wonderful than true;
And, in their nicest speculations, choose
To make their own discoveries strange news,
A natural mystery rather a gazette
Of rarities stupendous and far-fet;
Believe no truths are worthy to be known
That are not strongly vast and overgrown.

Onondaga Co., N. Y. NELSON RITTER.

PREVENTING SHOULDER-GALLS.—One of the best preventives of this is to keep the collar on the horse, after bringing him into the stable, till the sweat is perfectly dried off. Look to it also once a week, to see if no sticky lumps are formed on its inside, and if there are any wash them off with hot soap-suds, then rub the collar with neat's-foot oil. It is essential to look to this at least once a week, and always keep it clean and soft. It is better to keep all the harness on a horse, if quite sweaty when brought into his stable, till his hair is perfectly dried. The remedy for galls given in the RURAL of July 31, is, no doubt, a good one; but horses when first taken out to work in the Spring, not having had the collar on them much during Winter, ought not to be used over two hours the first day or three hours the second, their work being gradually increased as the skin and flesh harden on the shoulders. The flesh of the body also becomes soft after lying still some time, and requires gradual seasoning, or what is technically called "bringing into condition." It is thus that trotting and race horses are trained to perform their great feats with rare injury to them. A. B. A.

AN EXTRA-EARLY NEW SEEDLING PEACH.—Mr. W. H. Fredenburgh, of Kingston, N. Y. sends us a peach taken from a four-year-old seedling tree growing in his garden and from which he gathered ripe peaches on July 20. He calls it the Fredenburgh Seedling and claims that it is five weeks earlier than any peach grown in that neighborhood.

The peach was much decayed. We judge from the sound portion that it is a free-stone, very juicy—very sweet.

Everywhere.

CONNECTICUT NOTES.

CONN., Bloomfield, Hartford Co., Aug. 3.—A rainy day affords an opportunity for sending the RURAL a few lines from this quiet country farming town—a pleasure I have had for several successive years. To us denizens of the city whose vacation from the busy routine of daily life seldom exceeds a few days, the hours spent in-doors when one can stay out, seem like time lost. So, except when absolutely compelled to seek shelter from the rain, I can usually be found in field or forest, or taking my ease in a hammock swung under the kindly shadow of convenient apple trees, where, interested in the pages of some easily read book, or quietly dozing, I enjoy a rest more serviceable, so far as regards the restoration of expended vigor, and the accumulation of vital force, than I can conceive possible elsewhere. I feel a sympathy for those who, having no old country home and loving friends to welcome them, spend their vacations amid the hurry and bustle of fashionable resorts by the sea or in the mountain, or undergo the unpleasantness of the ordinary country boarding-house warfare, where the chief object seems to be to get the greatest amount of money for the least outlay for provisions or service. The rain now so gently falling is very acceptable; for, although this section has not suffered so severely from the drought as many others, there has not been a superabundance of moisture since early Spring. Potatoes that were planted early, or in soil naturally moist, promise a fair crop, but those set at about the usual time or later, give promise of but a poor return. The hay crop, now mostly gathered, was good both as regards quantity and quality; but there has been little show for a second crop either to gather as aftermath or rowen, or to feed off for Fall pasturage. Continued rains may make a rapid growth, however, for which there is yet time.

There seems to be considerable difference of opinion as to the best method of treating grass lands of moderate quality. Where there sufficient fertility to give two good crops, they are gathered, but where the first crop is only moderately large, some claim if the second be cut, the grass will not grow sufficiently thereafter to properly protect the roots in the Winter and keep them from killing if snow does not lie on them constantly. Others think meadow

pasturing in the Fall quite necessary as well as a profitable way to use the second growth. It seems to me the more profitable way is to have no more meadow than can be kept sufficiently rich to furnish two good crops. The less acres one tills to produce the same result, the more profit he usually receives. Many men Grow poor on large farms, while their neighbors on smaller ones constantly, if slowly, accumulate fortunes.

Tobacco continues to be the crop depended upon by the farmers here to bring them ready money. It is looking well at present, but it is a hazardous crop at best, and from the time the seed-beds are planted until the crop is sold and the money therefor collected, it is always in danger of damage or destruction. A Mutual Insurance Company, intended to protect growers from loss by hail-storms, was incorporated by the Legislature last Winter, and is now in working order. The grower pays for every hundred dollars' insurance two dollars and a half, and becomes liable for an assessment not exceeding five dollars more. If his crop is damaged by hail the Company agrees to pay him the amount of the damage as appraised. The whole amount planted in the township will not vary much from that of previous years; but there is not so much of the Spanish as last year, that variety not selling for as much more than the Seed Leaf as was expected, while the weight per acre is considerably less. Said a gentleman in my hearing to one of the largest and most successful tobacco growers in the vicinity: "How do you manage with less manure and less labor than your neighbors seem to use, to get crops equal to, if not larger and better than theirs?" "I do it by *cultivation*," was the reply. "I always plow and hoe a little while before it seems absolutely necessary, and I find it puts me ahead and keeps me ahead." There are other crops beside tobacco in which cultivation can be made to stand instead of manure and labor, to advantage.

Apples are abundant and good. Pears are scarce. Peaches are becoming year by year more plentiful. It is yet an unsolved question why, during the past forty years, there have been times when peaches were abundant here for a while, then for ten or fifteen years it has seemed impossible to raise them except in a few peculiarly favorable situations, after which trees would again grow vigorously and bear prolific crops of fine fruit. There is no doubt that for the next ten years peaches will be plentiful in this neighborhood. Butternuts, hickory-nuts and chestnuts are indigenous to the neighborhood, and I have often wondered why no more attention is given to having a few trees close at hand. A tree or two of each, if no more, could be planted on every farm, giving enough for home supply and probably some for market. They are readily raised from seed, or can be easily transplanted from forests. The hickory is most difficult to move in consequence of its long tap-root with few fibers; but if this root be cut off in early Spring, a foot or more below ground, the depth depending on the size of the tree, fibers will start and six months or a year thereafter, it can be transplanted with as much certainty of life as trees from nurseries. It is also a matter of surprise to city people that there are so few small fruits—strawberries, raspberries, grapes, etc.—cultivated, when they require so little labor and attention. I asked the reason, and was informed that the principal obstacle in the way, not of their culture, but of their successful gathering by proper hands, is boys, and that when there are four churches, each having a Sunday school, within rifle-shot of where I write, there must be something wrong somewhere. L. A. R.

RURAL SPECIAL REPORTS.

KY., Forks of Elkhorn, Franklin Co., Aug. 6.—The harvest now is just about over. Barley, rye, wheat and oats are all splendid crops. Hay is hardly an average. Corn will be excellent; but there was less put in than usual. We had a fine rain a couple of days ago, which was most gladly received, as we had a very hot, dry spell. L. M. B.

MICHIGAN, Eastport, Antrim Co., Aug. 7.—Fall grain was never better, on an average, since the country was first settled. Spring crops are not all harvested yet; those that were got in early will be an average; but late-sown will be an entire failure. The extremely wet weather we had the first of June injured Spring crops, and the continuous wet caused late-sown Spring wheat to rust. Such violent wind and rain storms as we have had have never been seen in this section by the oldest settlers; but while these have damaged some crops, they have been the means of producing the largest hay crop we ever have had. Berries and fruits of all kinds are abundant. Young orchards that never bore before are groaning under their loads of fruit, so that it was necessary to thin out in order to save the trees from breaking down. It is very dry here at this present time; if we do not have rain soon late potatoes will suffer very much. There is not a great deal of corn raised here; what there is looks well, but is not as forward as it was last year at this time. The potato beetle does not seem to be as plentiful as in years past. M. M. P.

MICH., Memphis, Macomb Co., August 5.—We have had a fine growing season—rather wet for some grounds. Crops are all good except barley. It is a "catching" time for harvest, but wheat has been secured without much injury and is now being thrashed, and farmers are busy in the oat harvest when the weather will admit. Apples are so abundant that they are rotting on the ground. We don't want any more orchards for market. The Mold's oats are splendid. So are the cow-peas; they are now filling, and if they get ripe I shall be pleased with them. The Golden Ovoid mangels are fine, some of them, I think, would measure eight or nine inches through the center. The little Hebron potato the RURAL sent me last year produced about a peck. I planted them this Spring and they are doing the best of any of the several varieties I am growing. The Blount's corn is towering high; but I fear our seasons are not long enough for it. B. S.

MICHIGAN, Three Rivers, St. Joseph Co., Aug. 6.—Wheat is a good crop. Hay was heavy. Potatoes are doing well, where the bugs have left any; where they were vigorously fought, there's a fine crop. Corn is very good, but needs rain. Peppermint also, which is grown considerably here, is in good condition. S. M. S.

OHIO, Winfield, Tuscarawas Co., Aug. 6.—We have had a very favorable season. There is an immense crop of wheat, and an average one of hay. Oats were damaged somewhat by rust. Corn is exceedingly promising, and for pasturing and dairying a better season has not been enjoyed here for years. W. M. K. K.

TEXAS, Dayton, Liberty Co., August 6.—Our crops are very fine. No sign of the cotton worm yet, though if rainy weather is a sure token, he will be along after a while. However, thanks to the RURAL, I am ready for him at any moment, and off he must march to the music of Paris-green and a two quart, perforated tin cup. G. G.

UTAH, Richfield, Sevier Co., Aug. 7—As far as prospects go, there will be about 20 bushels of wheat to the acre here. Corn has always hitherto been a failure. Oats will average 30 bushels per acre; potatoes, about 75 bushels; barley, 40 bushels. Our main crops are wheat and oats. There are in this county about 1,000 acres of wheat and 1,500 of oats, and some 500 of potatoes, corn and barley. Sugar-cane is as yet a failure, but the Early Amber may prove a success; it has just been introduced. Some 200 acres of Lucerne are raised here. It cuts a heavy crop three times a season. This is the first year in which apples have been a success. They generally blossom in April and freeze off in May or June; but this year Spring came very late, and hence we have a good crop. Pears do well, but are but little raised; peaches and apricots froze down last Winter—some trees clear to the root. Currants of all kinds are raised extensively, and are a very heavy crop. Gooseberries are almost an entire failure and have been for several years. All kinds of vegetables grow excellently; yet beans, melons, etc., will freeze off occasionally. Our crops have but one live enemy yet here—the grasshopper. One kind, a little yellow native, has done considerable damage this year; the common traveling locust has not been here yet. J. C. H.

WISCONSIN, Fall City, Dunn Co., August 7.—Haying is done in this vicinity; grass was good on clay soil, not so good on sandy prairies. At present we are in the midst of the wheat and oat harvest. The former is good on new land generally, but was hurt somewhat by hot weather and chinch bugs; while on old land some is not worth cutting. Wheat is an uncertain crop in this part of Wisconsin and farmers will have to depend on something else to get a living, unless the seasons become more favorable for raising wheat. Oats are a good crop—will average 40 or 50 bushels per acre. Corn is very promising and if we have no early frosts will be a good crop. There is a large acreage under it in this county. We have a fine growing season here; rains come just when needed. My Mold's oats are doing well. I drilled them in a row six rods long, but find they would have planted another of the same length. They tiller out so much I think a bushel of seed would sow one acre. I measured a stalk to-day and it was four feet nine and a half inches in hight, head included. They are a great curiosity to my neighbors who look at them. I have several Kinver's mangels that are 17 inches in circumference and growing finely. The cow-peas are doing well, but I am afraid they will not ripen in this climate. We need more laborers here, as help is scarce and wages $2 per day for harvesting. Plenty of work at lumbering in winter time for good men. G. W. P.

WIS., Eagle, Waukesha Co., Aug. 4.—Crops are good, corn never was better. Mine is good for 100 bushels of ears to the acre. Fall wheat is splendid; a large acreage was sown. Apples are a fair crop; no peaches; few pears; a considerable amount of sorghum is grown here; a new mill has been set up within a few miles of us. The Early Amber cane is being experimented with this year. C. D. W.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

A Backwoods Lime-kiln, etc.

S. H., South Oshawa, Ont., Can., asks: 1, how to build a lime-kiln in the backwoods—it must be very simple; 2, how many feet must there be on each side of a piece of ground measuring six acres; 3, what grass or creeper would cover rocks in a pasture; if fit for cattle, so much the better; 4, will Lucerne do well in that latitude; 5, how much Timothy seed should be sow with rye the coming Fall—the rye to be for grain and the Timothy to remain for a hay crop; 6, is Clawson the best kind of wheat he can sow on new land, and what sort of wheat is American Spring wheat, and will it do for Winter sowing; 7, Having a log-house, and his wife being desirous of obtaining a vine that will run up and cover it, our friend asks what kind of vine would be the best.

ANS.—1. When a farmer has a supply of limestone which he wishes to burn for his own use, the simplest way is to make a pit something like those in which charcoal is burned. This is made by laying down a floor of small logs or split timber in a hollow place. A layer of broken limestones is thrown on this floor, the blocks being arranged as at Fig. 270, so as to form flues by which the pit is set on fire and

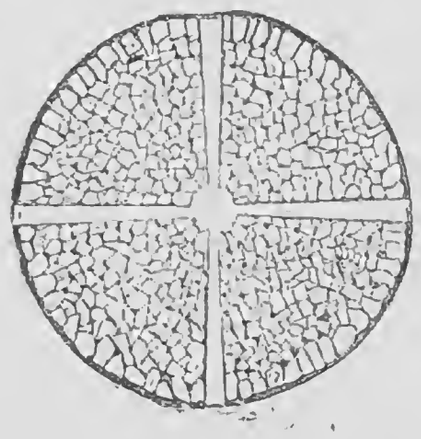


FIG. 270.

ventilated during the burning. The pit is built up of alternate layers of wood or small coal and broken limestone, a sort of chimney having been left in the center. The outside is laid up with care in a conical shape, and plastered over with clay mud. Fire is then applied to the flues, which, like the chimney, should be filled with light wood. The fire should be kept burning slowly by plastering all the cracks that may appear in the wall as the mass settles, or by thrusting into them sods or pieces of limestone and covering these with wet clay. Once the fire is well started, the flues should be filled with fresh wood, packing it in as far as possible, and then closing the mouths with stone or clay. In 72 hours the burn will be complete, and when the whole mass is red-hot, it may be left to burn without further attention, except to punch it well together and fill up any openings by which fresh air could enter to cool the pit too soon. The unburned pieces of stone outside may be kept for another burning and the perfect lime be taken out for use. To use it, it should be thrown in heaps of two or three bushels and exposed to the weather, or to one or two showers of rain, by which it will be slaked, falling to a dry powder, when it should be spread at once upon the land. One ton of good limestone will yield a little over half a ton of burned lime, and in slaking one bushel of lime, weighing 80 pounds, will absorb 26 pounds of water and swell to more than twice its bulk. 2. One acre has 43,560 square feet; six acres contain 261,360 feet. The side of a square having this area is 511.233 feet, or 511 feet three inches and a very small fraction. Thus a field 511 feet three inches each way will contain six acres. 3, We think of nothing better for your climate than Triticum repens, Quack, Quitch, Quick or Couch grass. 4. We have known it to do well in Southern Ontario. 5. About one peck. 6. Clawson is productive and very hardy. We know of none better for new land. There is a large number of varieties of American Spring wheat. Some of them, when sown in the Fall, in more Southern latitudes, do pretty well. 7. Akebia quinata would probably stand your climate. Aristolochia Sipho (Pipe-vine) is also very hardy and appopriate for your purpose.

Queries About Cheese Making.

E. H. A., White River, Col., asks: 1, how much rennet is required for 100 pounds of milk in cheese making; 2, to what temperature should the milk be brought when the rennet is applied; 3, how long should the curd stand before being put in the press; 4, how should the rennet be prepared; 5, how much salt is required for the curd of 100 pounds of milk.

ANS.—1 and 2. The usual allowance is half a pint of infusion of the rennet for 100 gallons (880 pounds) of milk. Another measure is to take a piece of the dry rennet, 2x4 or 3x3 inches in size, and steep it in a pint of salt water for 12 hours in a warm place. This is for 100 gallons of milk. An accurate measurement is 600 grains of the dry rennet steeped in 24 ounces of water at a temperature of 70 degrees for 24 hours for 100 gallons (880 pounds of milk) heated to 90 degrees. In the Cheddar system the milk is heated to 100 degrees. 3. The time during which the curd is kept in the vat depends altogether upon whether the cheese is made on the sweet-curd or acid-curd system. Very little acid is developed in an hour and a quarter with two turnings and exposure to the air in a heap, and the curd may safely remain for this time, or even longer, but this depends very much upon the weather. The curd should stand only until it is distinctly sour, and not longer, when it should be put to press. 4. Rennet is made by drying the stomach of a sucking calf, after well rubbing it with salt. The stomach should not be washed, but only emptied of its contents, and is stronger if the calf has not been fed for some hours before it is killed. 5. Two pounds of salt are used for 100 pounds of curd; 100 pounds of milk make 10 pounds of cheese; 100 pounds of milk would require one tablespoonful of the infusion above mentioned.

Miscellaneous.

J. F. A., Saline, Mich., asks whether raising clover for seed exhausts the soil, and if so, whether it does so as much as wheat.

ANS.—Nothing can be taken from the soil that grows upon it without impoverishing it according to the amount that is taken. Clover seed is no exception. The advantage of clover is that the roots extend to a considerable depth in the soil and nutrient matter previously unavailable is brought nearer the surface. The roots also improve its mechanical condition. To raise wheat is more exhaustive than to raise clover seed. The difference between removing equal amounts of wheat and clover seed would be the difference in their constituents for which see analyses in previous numbers.

A. H. G., Auburn, N. Y., wishing to make conversational connection between two houses 100 rods apart, asks what has been our experience of the telephone made by Prof. Brooks, of Phelps, Ontario Co., N. Y., which was highly spoken of in the RURAL last Spring.

ANS.—We value it as a sort of plaything. Ours needs so much attention that we have abandoned it for any serviceable use; but others have praised it in high terms. We would advise you to write to Prof. Brooks, whose word we are far from having any reason to distrust. It is not right that negligence on our part should be permitted to prejudice the sale of the said telephone.

P. S. W., Newmarket, Va., asks whether there is any machine for harvesting corn.

ANS.—There have been several attempts to perfect a machine for harvesting corn, but none has as yet been successful. The inventor of such a machine will not only confer an enormous benefit on his race, but will make a vast fortune for himself. "There's millions in it" every way it is considered.

W. K., Franklin, N. J., asks would it be good policy to plow in a coat of yard manure and then apply 30 or 40 bushels of lime per acre as a top-dressing where he intends to sow rye and seed down this Fall, or is there a better time or way to apply the lime.

ANS.—We do not know of a better time or way.

A. E. W., River Falls, Wis., sends plants for name.

ANS.—No. 1 is Elymus Canadensis—Var. glaucifolia—Lyme grass—Wild rye. No. 2. Bromus ciliatus—Ciliated Broom-grass. It is worthless. 3. Hordeum jubatum—Squirrel-tail grass.

D. C. asks for the name and price of the best work on breeding fish, especially speckled trout.

ANS.—Roosevelt & Green's Fish Hatching and Fish Catching, $1 50. The American News Co., Chambers Street, New York.

S. A. L., Clyde, N. Y.—Box of Hulless Barley received. We have the same. What advantage has it?

COMMUNICATIONS RECEIVED FOR THE WEEK END: G SATURDAY, August 14th.

Miscellaneous.

WHAT OTHERS SAY.

UNDERTAKING TOO MUCH.—From the columns of the Gardener's Monthly for August we make the following notes:—Over and over again, as we travel through the country, are we impressed with the fault of over-large places. Many gardens are laid out in the flush of some temporary business success, and they become sources of great annoyance in the great expenses of subsequent maintenance. Even the richest seem to undertake too much. We should lay it down as a rule that in all suggestions for the improvement of grounds, the subsequent cost of keeping in order should be studied well. This is the rock whereon so many strike. Walks and roads are particularly expensive to maintain, and should never be made without there is an evident necessity for them. Shady grass walks, with masses of flowering shrubs on each side, and kept mown a few times a year, are as pleasurable parts of a pleasure ground as can well be provided, yet we very seldom see them employed.

ROSES.—All Mr. Henderson's pot roses were in fine health and vigor when I saw them. The show of buds which presented themselves would have done credit to many a bed of established plants. He finds the most sale for Niphetos, Safrano, Isabella Sprunt, Bon Silene, Cordelia Cook, Douglass and Perle des Jardins. The latter rose is now taking the place of M. Niel in some establishments, it being a free and continuous bloomer when properly grown, and the flowers are nearly as large as, and higher in color than, the well-known "Niel."

CARNATIONS.—Mr. Wm. Bennett, Flatbush, L. I. grows carnations, the best, I think, I have ever seen. He grows Peerless largely, and King of the Crimsons, the freest flowering and best dark-colored carnation I have met with. Miss Jolliffe he has in large quantity; it is a delicate shade of pink. "Snow-white"—a kind sent out a short time ago by Mr. Peter Henderson—is proving itself to be a wonderful free bloomer, and the flowers are pure white. It is a decided acquisition. I have heard complaints that it does not possess sufficient vigor, but under Mr. Bennett's treatment it is certainly hard to beat. His treatment is to keep them quite cool at night, and to give them plenty of air on every favorable opportunity in the day time.

TREATMENT.—I am satisfied that the cool treatment is the proper one for carnations, and if all the growers around New York or elsewhere would adopt this mode of growing them, instead of a rose-forcing temperature, they would not have them in such a deplorable state as they were last Winter.

LARGE MARECHAL NIEL ROSE.—Mr. Pearson, an English florist, cut from one plant last year 2,000 flowers. Prooably some of our large rose growers could beat this. We should like to know.

STANDARD PEARS AS THEY OUGHT TO BE.—It is a fact well known that about nine-tenths of the standard pear trees planted in the West are grown in New York and Pennsylvania. These trees are grown according to their best judgment, judgments rendered by their ancestors in the fatherland generations ago, and have been passed from father to son and neighbor to neighbor, until it now would be considered sacrilege to depart from them. Our objection is to the hight of the top and the size of the tree. A No. 1 standard pear tree, as sent out by these nurserymen, is six to eight feet high, three to five years old and branched about five feet from the ground. Now, Mr. Editor, if I was called upon to tell what sort of tree is most worthless in every State west of Ohio, I would hardly change the above description. A No. 1 standard pear for the West should be three to five feet high, two to three years old and branched one to two feet from the ground. The tops must come down as we go west, and for central and western Kansas six inches to a foot is high enough.

ARTIFICIAL WATER IN GARDENS.—Whenever we have heard people deride Colorado because they have to depend on irrigation for most of the water for their growing crops, we have thought that it would not be bad for Eastern growers to have at command artificial conveniencies. Strawberry growers East would have found a wind-mill for a water pump a paying investment for strawberry beds the past May. They were nearly ruined by the May drought. Those who could have commanded a Colorado ditch would have made a fortune.

CURE FOR THE TOBACCO HABIT.—Dr. Millard, in the Med. and Surg. Reporter, calls attention to the value of "pine-apple," as it is called—a fungus that grows upon pine trees—as a cure for the tobacco habit. He has used it and prescribed it frequently, and has seen no case in which it failed to eradicate the craving for tobacco. It is not unpleasantly bitter. It is used as a moderate chewer uses tobacco.

SCIENTIFIC ARROGANCE.—A somewhat labored and diffuse article on "Scientific Arrogance" in a late Pall Mall Gazette comes to the following very sensible conclusion:—"It would appear that scientific arrogance, in so far as it has any reality, is but the obverse of popular ignorance. Let the ignorance be dispelled, and the mystery bred of it will vanish. Let some rudiments of exact knowledge, some grounding in the methods of scientific reasoning, and some notions of the nature and ends of scientific work, be made part of our general scheme of instruction, and scientific dogmatism will be impossible. Let the mind be trained betimes to walk modestly and warily, as all true leaders of knowledge have walked, by the light of diligent and patient inquiry, and the specter of scientific arrogance will disappear."

CLEANLINESS IN BUTTER MAKING.—From the letters on Dairying by Dr. De Kleuze as published in the London Gazette, we take the following:—The most perfect cleanliness is indispensable in buttermaking, as every fault in this respect revenges itself by deteriorating the quality and especially the durability of the produce. If the milk dishes, cream vessels, and churns are only rinsed out with water, that is not sufficient. Especially if these utensils are made of wood, the greatest care is necessary, as particles of butter and casein are absorbed by the pores in the wood, sour there, and infect cream or butter when they are brought in contact with them. To avoid this we have a very good substance, the solution of caustic soda, which may be had in every chemist's shop at a small expense. This solution is employed by mixing about a wineglassful with two or three quarts of water and rinsing the vessels in question thoroughly, letting the solution stand in them for a few minutes if possible. Churns are very easily cleaned by pouring some of the solution into them, closing them, and letting it act during a quarter of an hour, frequently moving the churn to insure all its parts being well washed. In general, it may be stated that if all the vessels employed in a dairy are rinsed out, first with cold and then with hot water immediately after their use, the application of caustic soda need not be repeated more than once or twice every fortnight. After employing it a good rinsing of water must take place, otherwise the milk might taste soapy, especially if some of the soda has remained and got mixed with the milk.

LONDON-PURPLE.—"Last summer we tested a comparatively new arsenical poison called London-purple, and the results were extremely gratifying. This poison is a residuum obtained in the manufacture of certain aniline dyes and utilized by the addition of lime and carbonaceous matter, thoroughly dried, and finely pulverized. We compared it with Paris-green last year as an exterminator of the potato beetle, and it seems to present the following advantages: it is cheaper, stronger, more finely divided, and possesses greater adhesiveness." The above is from the Report of W. R. Lazenby of Cornell University.

ROADSIDE CARE.—There is another place from which farmers should exterminate weeds, and this is the roadside, says Mr. Hyde in the N. Y. Times. We care not how nicely a farmer cultivates his fields, we call him a sloven if he neglects the roadside, and allows it to become a perfect swamp of thistles, mulleins, golden rod, or any other weed. How is he to prevent his farm from being stocked with all manner of vile stuff if he permits the roadside to be a nursery for its propagation. Does he not know that seeds make to themselves wings and fly away? If he has not æsthetic culture enough to consider roadside weeds a deformity to his premises, self-interest and a due regard to his neighbors' rights should induce him to allow no weeds to go to seed on land over which he has jurisdiction

ANOTHER of the August farm duties is to fill the barn-yard and pig-pens with muck or some other absorbent to save and increase the supply of manure.

AGAIN Mr. Hyde remarks: Farmers need a little relaxation as well as other folks, and can afford to take the recreation if they only thought so. We would not advise the average farmer to spend much time at Saratoga, Newport, or any other of the fashionable watering-places. It is well enough to look upon these resorts of fashion for a day or two, just to see the folly of the display; but there are other modes of recreation which sensible farmers, and sensible men of all classes, will prefer. One great want of the farmer is to get away from the little circle in which he acts and thinks, and mingle more with men.

PURE WATER FOR THE DAIRY.—The importance of having pure water for the dairy, as well as for animals to drink, is not sufficiently apprehended. Prof. Sheldon says, in the London Live Stock Journal: Not only is the blood of animals who drink impure water liable to be poisoned by the bacteria which such water frequently contains, but these putrefactive germs will impregnate both butter and milk if permitted to come into contact with them. The boiling water which should always be used in washing dairy utensils will destroy the bacteria; yet, as butter cannot be washed in boiling water, it is in the first degree important that the cold water it is washed in should be pure. The water is intended to purify the butter, not the butter the water.

DR. C. W. EARLE has been examining the validity of the claim made in Chicago for cinchona as a specific for the cure of inebriety. The result of Dr. Earle's investigation, says the New York Medical Record, is that the cinchona treatment made more drunkards in the past year than any one liquor saloon.

A WRITER in the British Medical Journal declares that glycerine in half teaspoonful doses is a simple and effective emetic for children.—Druggists' Circular.

HOG CHOLERA.—A correspondent of the Chemical Gazette (Ohio) gives the following cure: He has made this disease a study, and finds by careful experiments that the following mixture comes nearest reaching the disease. As an excellent condition powder for hogs, and as a preventive and cure for hog cholera it can hardly be surpassed. Yet the remedy that will cure in one section of the country may be only a palliative in another. There it rarely fails to eradicate the dread disease, and is by some considered a specific. The formula is the subjoined:

Jamaica ginger	4 drachms.
Sulphate of soda	1 ounce.
Chloride of sodium	4 ounces.
Sulphide of antimony	4 "
Licorice root	4 "
Flaxseed meal	4 "
Black mustard	4 "
Resin	4 "
Nitrate of potassa	4 "
Capsicum	1 ounce.
Sulphate of iron	2 ounces.

Powder each substance separately, and mix them all thoroughly by passing through a fine sieve. The dose is from one to three tablespoonfuls, two or three times a day, mixed with soft food.

HERE AND THERE.—An intelligent Englishman who recently visited this country reports that he was deeply impressed with the sense of ownership, in the nation at large, which seemed to pervade all classes of our citizens. He had been accustomed in England to the prevalence of the feeling among the mass of her people that they neither owned nor controlled that country, while in the United States the opposite sentiment prevailed to a surprising extent. In meeting here workmen whom he had formerly known in England, he was astonished at the readiness with which they had adopted the habit of regarding officials as public servants instead of churlish masters.—Progress.

LARGE STRAWBERRIES.—Some strawberries shown at the Brighton Show the other day, by Mr. Rutland, created quite a sensation, being admitted to be the largest ever seen. Some idea of what they were may be gleaned from the fact that eight weighed one pound, one ounce. One measured three and three-quarters inches across it and several three and one-half inches; they were not only large, but a very abundant crop, and have been the admiration of all who have seen them. So much for deep cultivation. Very little rain has fallen at Goodwood this season compared with many parts of the country, and not one drop of water have they had but what has fallen from the clouds. The above we find in "*Gardening*," England. As we remember, the largest berry as above is not quite so large as the specimen of President Lincoln given in our last Fair Number.

THE London Agricultural Gazette of latest date says:—Our little enemies, the sparrows, must be watched and prevented from depleneshing our corn fields. We shall probably have one of the finest potato crops on record. The wet came at the right time, and if, as is probable, we are favored with a fine time during the next two months, we shall not suffer from the blight. The quality and the size of tubers now being dug are exceptionally fine, and indicate a large crop. We never remember to have seen potato fields and gardens looking more luxuriant than they do at present. Mangel is almost an universal failure.

BEER IN THE HARVEST FIELD.—It will be borne in mind that English farmers have a custom of giving their laborers daily rations of beer. We are glad to see the following from the same journal:—"The question of beer once more obtrudes itself. We have discontinued its use and substituted money payment. The testimony of Sir William Thompson, Sir William Gull, and Dr. Richardson, against even the moderate use of alcohol must be considered as conclusive. It appears that alcohol neither increases the strength, the mental activity, nor the bodily warmth. The only excuse for its use is that it is nice and we like it. That it does us any good is denied on the highest authority, and that it does immense harm is known to every one." We say, confound beer and all spirituous liquors at all times and upon all possible occasions!

BRIEFLETS.

CHARLES DICKENS has said: "That portion of the occupation of a farmer which pays best for cultivation is the little piece that lies within the ring fence of his own skull."....."William Parry, the keen observer, discovered the worth of the Cuthbert, and gave it the name of the 'Queen of the Market.'" So remarks Mr. Green in the Rural Home. But Mr. Parry says they are not the same. .....It must now be admitted that Gen. Le Duc has brought the Department of Agriculture to a condition of usefulness far beyond anything attained by his predecessors. So says the Husbandman. It is very generally admitted among candid men. But we should like to see those journals that hastened to call him "fool," "knave," or both, admit that they were hasty, if not wrong. Is there no sense of justice or candor to constrain those journals to make such an admission? If not—shame upon them!.....Farmers, prepare your fields for wheat—the sooner the better—and prepare them well .....Mr. Elliott, so he says in the American Entomologist, is convinced that a judicious use of pyrethrum (insect powder) would save an immense amount of loss. He has seen it used in large mills, and it brought out roaches in quantities which astonished the millers. A friend of his who cannot sleep if a mosquito is within a mile of him, says he has only to put a little powder on some burning paper in his room and there is "perfect peace."....Progress thus translates a French anecdote:

Guibollord has been a father just five minutes. His servant entered with a letter in his hand.

"What is that?"

"A letter."

"For whom?"

"For you."

"How is it addressed?"

"To M. Guibollard."

"How do you know, sir, that it is not for my son?"

.....It is easy enough to exterminate Purslane if pulled up early in June before it seeds. At this season it pays to pull up the large spreading plants for the pigs.....We have seen how long a man may live without food. The next question is how ong he can live without food and water.....Mr. Ohmer, like the Man-on-the-Hudson, is distributing his favors liberally.....Mr. C. L. Allen brings to the RURAL office a spike of seedling gladiolus, the blossoms of which are as nearly a solid white as any we have seen. Many pure white gladioli have been announced from time to time, but all are more or less tinged in some part with various colors.....It would seem from the accident to the vineyard of Mr. Williams that a lightning-rod on a house is no protection 60 feet away from it on the ground. The fact is that lightning gets on the rampage sometimes and can't tell a lightning-rod from a hole in the ground..... A woman cannot become a successful lawyer. She is too fond of giving her opinion without pay. —Oil City Derrick.....If it can be proved that a man can fast for forty days, it ought to kill the oily margarine trade. If he can go that long without food he can afford good butter when he does eat.—Phila. Kronikle-Herald.....The handsome and fashionable seaside resort called Long Beach is just opposite the RURAL Farm. Our readers from every part of the country while visiting Long Beach may, if they will take the trouble, count the number of ears to a stalk on Blount's corn by the aid of a good glass. But we also extend a cordial invitation to them to sail across the bay and pay the Farm a visit....."To whip or not to whip" in the schools is a London agitation. Progress. The question might well be agitated here, in our country schools especially..... The variegated Euonymus radicans is a handsome little hardy evergreen shrub that our readers should not neglect.....Mr. Meehan says in the August Monthly that he has not heard of any trials with standard gooseberries;—that it was hoped that we might thus have the foreign varieties in our gardens in all their luscious English perfection. By standard gooseberries is meant those worked upon the Missouri currant. We have tried them for the past four years. They are worked on straight stems four to five feet high. But both leaves and fruit so mildew that we have never yet secured a ripe berry.....But currants grafted upon these tall stems are very fruitful and while in fruit decidedly ornamental. A bush of currants growing upon a naked, slender stem five feet high is——well, to use an entirely original expression—a thing of beauty.....A German lady says:—"Beware of the one black sheep that is almost certain to steal in among any large flock of girls." This item properly belongs under our Sheep Husbandry department..... The Druggists' Circular gives an instance of poisoning by Poke-root—Phytolacca decandra.....Large beds of Sweet Williams, as the London Garden remarks, are really grand. Those who know only of the old kinds of this plant, will be pleased with the newer strains.....We are always gratified to see our friends at the RURAL office and often regret that our time does not permit us to give them the attention we desire to do. Of all days in the week, we are the least engaged on Wednesday and could consequently enjoy their calls upon that day with less interruption than upon any of the others .....Have many of our readers cultivated the improved strains of Chinese Pinks; of Picotees and Carnations? They are among the most pleasing and interesting of our border or house plants and among the most valuable for both Summer and Winter bouquets..... Our respected friend, Mr. Warner, knowing that a melon is ripe when it comes off the stem easily, soliloquizes thus:—"You can tell when people are ripe by their willingness to let go. *Richness* and ripeness are not exactly the same. The rich are apt to hang to the stem with tenacity. I have nothing against the rich. If I were virtuous, I should like to be rich. But we cannot have *everything*, as the man said when he was down with small-pox and cholera and the yellow-fever came into the neighborhood.".....Mr. Charles Darwin is still hale and hearty, though seventy years of age. We have not heard from him lately, but it may be presumed that he is not idle. Let us hope he has work in hand that when published will again set the world to thinking and investigating as have his researches in years past..... .

CATALOGUES, ETC., RECEIVED.

PURDY'S Small Fruit Instructor. A book of 64 pages, well filled with plain and ample instructions. In fact this little book, the price of which is but 25 cents, contains all needed information respecting the topics of which it treats and is just as valuable in the hands of the average small-fruit grower as other works which cost four times as much. A. M. Purdy, Palmyra, N. Y., is the author and publisher.

AGRICULTURAL, Botanical and Chemical Results of Experiments on the Mixed Herbage of Permanent Meadow, conducted for more than 20 years in succession on the same land. By J. B. Lawes, L. L. D., F. R. S., F. C. S., and J. H. Gilbert, Ph. D., F. R. S., F. C. S.

Also Memoranda of the origin, plan and Results of the Field and other Experiments conducted on the Farm and in the Laboratory of John Bennet Lawes, at Rothamsted. These important works will be referred to more at length in future numbers.

QUARTERLY REPORT of the Kansas State Board of Agriculture for quarter ending June 30, 1880. J. K. Hudson, Secretary. Topeka, Kansas. An important feature of the Report is the article on sorghum growing.

NINTH REPORT of the State Entomologist on the noxious and beneficent insects of Illinois, containing the Fourth Annual Report, by Cyrus Thomas, State Entomologist.

EIGHTH ANNUAL REPORT of the Wisconsin Dairymen's Association, compiled by D. W. Curtis, Secretary.

THIRTY-EIGHTH ANNUAL CATALOGUE of the Missouri University at Columbia, Mo.

$25 in Doctor's visits, will do you less good than one bottle of Hop Bitters.

THE
Rural New-Yorker,
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, AUG. 21, 1880.

ONE of our neighbors raises his tomatoes in the family asparagus bed. The plants soon cover the ground, subduing the weeds, and yet they do not noticeably retard the growth of the asparagus. The vines and green or half-ripened fruit are killed by the first frosts, affording a mulch through the Winter and some fertilizing material in the Spring.

IN reply to questions which we always receive at this season of the year or a little later, let us say, transplant fruit or ornamental trees as soon in the Fall as the leaves begin to drop or change in color. This is sufficient evidence that the leaves are no longer of any service to the plant and the sooner it is then removed the better, for it will have a longer time to become well fixed in its new quarters before severe frosts occur. Spring is without doubt the best time to transplant evergreens.

WHY DO THE SLEEPERS OF BUILDINGS ROT RAPIDLY?—There are two reasons for this: The first is, because the stone or brick under-pinning is not made sufficiently high to keep them well clear of the ground; and the second is, when a continuous wall is laid all around for the sleepers to rest upon, the mason does not leave openings enough in it on the four sides for a good circulation of air underneath the floor. If this is done, and they are properly placed, sleepers will last nearly as long as the beams of the building overhead.

THE RURAL NEW-YORKER has intimated that prizes would be awarded to those who raise the heaviest mangolds from Vilmorin's Golden Mangold, the seeds of which were sent to applicants for our last distribution. We now request that all who have raised extra-heavy roots from this seed will give us the weights of three of the heaviest. The leaves are to be cut off even with the tops of the mangolds, and not included in the weight. Those who take the prizes may be called upon to send the specimens to this office by express—at our expense, of course.

THE PIG THE MOST HONORED OF ALL ANIMALS.—Are our readers aware that it is all the fashion at present in France—which of course will be soon followed everywhere else—for ladies to wear a jeweled sucking-pig on an armlet, a neck-chain, or a shawl-pin and other ornaments? To call a Frenchman a hog was formerly considered the greatest possible insult to him. If we now call him a pig, we suppose he will consider it one of the greatest of compliments. No doubt if our largest swine merchants at the West were to emigrate to France, they would get ennobled there, and be made princes, dukes, marquises, counts, etc., the rank being conferred according to the number of swine each one annually handled. Well, after all, we prefer to see a jeweled pig gracing a lady's arm or neck, than a snake with fiery ruby eyes, and sparkling forked tongue.

THE GREAT CHICAGO WHEAT CORNER has just been closed out with a loss, it is said, of several million dollars to its organizers and participants. It will be remembered that this was inaugurated about a year ago, James R. Keene and Jesse Hoyt being the originators. Their chief associates were Perry H. Smith, George L. Dunlap and Nathan Corwin, of Chicago, and Z. G. Simmons and Judge Howe, of Kenosha. Keene had a half interest in the syndicate, Hoyt a quarter, and the others another quarter between them. The end in this city assumed entire direction of the deal. Angus Smith, of Milwaukee, though not one of the clique, made an agreement with them to be guided in his operations by their directions, in the expectation of thereby reaping a rich harvest. At one time they had on hand, or subject to their control 16,000,000 bushels of wheat. They proposed to close out the deal in May; but the condition of the market then caused them to defer doing so until June, and meanwhile they decided by renewed purchases to force up prices, just before unloading. For a week or two it looked as if they might succeed, but the persistently low prices across the Atlantic soon made things look gloomy, and Hazleton, Hoyt's partner in this city, began to sell right and left, and so tumbled down prices still lower. Now almost all the stock of wheat has been sold and shipped and the Chicago gamblers are heavily mulcted; Smith, of Milwaukee, is out from a quarter to half a million dollars, and the losses of Keene and Hoyt can only be guessed at, those of the former being estimated at all the way from one to two million dollars.

THE VALUE OF WATER.

AN extraordinary exhibition, as all our readers well know, has recently been made in the City of New York. A person has undergone a complete fast from food for 40 days and has succeeded in passing through this severe ordeal without any serious damage, further than a loss of weight amounting to nearly one pound per day. Whether it has any importance in a physiological sense or as an aid to medical science need not here be discussed. One thing in connection with the trial is unquestionably instructive. This is the absolute necessity of water and that absolutely pure, which has been proved by it. A few days' abstinence from water brought the fasting man to the verge of death. The use of the impure city water immediately after this abstinence caused a dangerous nausea and feverish symptoms. The loss of weight during this abstinence was excessive and alarming. After nine days it was clear that without water the man would soon succumb. With the use of pure water, procured from a spring, all the disagreeable symptoms disappeared and a notable gain in weight was made during the next few days. The fast then progressed to completion, and at the end of the 40 days the faster took frequent meals of milk, beefsteak, watermelons, peaches and apples with impunity. The lesson that concerns us is this: pure water is an absolute nutriment and sustains the body for a time even in the absence of solid food. How seldom is this fact considered by farmers; and more especially that part of it which relates to the purity of the water used. This lesson is applicable not only to ourselves, but to our domestic animals. It is certain that we are too neglectful in regard to the water supply for our live stock. The majority of farms are deficient in this regard, and if water is scarce it occasions less concern than if fodder is in short supply. But water is of more importance than the fodder, and the greatest care should be taken that the supply of this indispensable nutriment should not only be ample but excellent.

THE GROWTH OF THE WEST.

THE marvelous progress of the great West is made apparent by the growth of the great State of Illinois. This State has been the fourth in population in the Union for some time, and there is a chance that the present census may prove it to be the third in rank as to the number of its inhabitants. But in agricultural products it claims to stand first, and its claim deserves respectful recognition. The State covers 50,000 square miles of land which in point of fertility is not surpassed perhaps anywhere in the world. The crops there grown include every agricultural product from cotton, through all the grains, to grass and its products of the dairy, and beef, mutton and pork, not forgetting fruits and vegetables in every variety. Its people are enterprising and its farmers skillful and energetic, as may be shown by the fact that 100 tile factories are employed in furnishing the tile to lay 10,000 miles of drains every year in the lowlands hitherto either uncultivated or only half worked.

The profitableness of this enterprising farming is illustrated by the fact that the first crop taken after draining repays the whole cost of the improvement. Twenty-five years ago Illinois was a new State. Last year its crops amounted to 306 million bushels of corn; 45 million bushels of wheat; 2½ million tons of hay; 54 million bushels of oats; 2,700,000 hogs; and a vast number of fat beeves, together with a large quantity of dairy products. The corn crop was one-fifth and the wheat crop one-tenth of the total product of the whole country. In these crops Illinois surpassed every other State. The value of the Illinois corn crop for the past six years equaled 470 millions of dollars, which is but seven million dollars less than all the gold and silver produced in the United States and Territories in the same period. What has been effected in Illinois, is being done in many other States of the West; and what will be done in the next 25 years will undoubtedly surpass all that has been done in any previous quarter of a century.

If we look for a solution of the question which naturally arises, why should the great West advance so rapidly in population and wealth, while some parts of the East are losing population and going back to a condition of almost primitive solitude and wildness, we must attribute it, first, to the opening of the country by one of the most complete railroad systems in the world; for Illinois has a greater mileage of rails than any other State, and some other comparatively new States are not much behind her; then the wonderful fertility of the soil, and, last but not least, the not less fertility of the people in energy, industry and enterprise. Truly the West is a remarkable country, and the Western people are as remarkable as their country.

A PROSPECTIVE CHANGE IN EUROPEAN AGRICULTURE.

THE vast development of agriculture in the West and Northwest has already wrought a great change in the farming of New England, and must inevitably in the near future have even a greater effect upon that of the British Isles, and, indeed, of western Europe generally. Our Eastern farmers, driven to a great extent by Western competition to abandon the production of grain, have wisely taken to the cultivation of vegetables, fruits, dairy products, etc., which cannot so conveniently be brought from the cheap West, and for which there is a profitable market in our large Eastern cities. The productive capacity of this country is far greater than its consumptive capacity, and is being developed very much more quickly, in spite of the extraordinarily rapid increase of our population

Owing to the unexhausted condition of the soil, the nearly universal use of the best labor-saving devices, the absence of rent charges, and the comparative moderation of taxation, the net cost of producing grain crops in the great West, even with the present transportation charges, defies the competition of the farmers of the United Kingdom under the prevailing agricultural conditions there. But here the rapid development of our railroad system, the keen competition between the various lines, and the greater economy in running expenses, are all the time slowly but steadily reducing freight charges. Last year nearly 4,000 miles were added to the railroad milcage of the country, and it is estimated that 6,000 miles will be built this year, and every mile constructed tends to cheapen grain at the seaboard. In 1869 the average charge on a ton of merchandise from Chicago to the tide-water was $24; now it is only $8, and the charges on grain and meat are considerably less. West of Chicago freight charges are still very disproportionately high, and in all that vast region there is broad margin for reduction, which must soon take place through the development of the country, the force of increased competition, the influence of public opinion, and if necessary, the power of legislation.

With a reduction of transportation charges through this productive section will come a still greater reduction of prices here at the seaboard, and consequently beyond the Atlantic. Moreover, improvements in the construction of ships, and greater economy in the generation of motive power, must soon materially lessen the expenses of ocean voyages, and consequently the charges on ocean freight. The amount of coals used by ocean steamers every twenty-four hours now, is considerably less than one-quarter of the quantity employed to generate the same power a quarter of a century ago, and economy in this direction and improvements in the models of freight-carrying vessels are progressive.

In view, then, of the rapid increase of the production over the consumption of grain crops in this country, of the steady decrease in the expense of transporting our surplus to foreign markets, and of the conditions under which foreign farmers must at present compete with us, it seems certain that a revolution must soon occur, first, in the agricultural conditions of the United Kingdom, and, perhaps, afterwards, *longo intervallo*, in those of our Continental customers and competitors. The chief features of the new state of things will be the ownership of the land by the tillers thereof, and the substitution of other crops for those of grain.

BREVITIES.

THE stickiest thing on the face of the earth, Prof. Sheldon tells us is London clay.

THANKS to a friend for beautiful specimens of Australian and Defiance wheat. The donor would oblige us by giving name and address.

A FARMER friend writes us: "The great objection that farmers have to agricultural papers is that they use terms they cannot understand."

DR. HOSKINS writes us: "I have grown American Wonder and Little Gem side by side for three years and find the former one week earlier with not half the growth of vine of the latter."

IN "Horticola's" notes of this week, it will be observed that the lightning struck the vine trellis within twenty yards of the dwelling. Mr. Williams tells us that the dwelling was "covered with lightning rods."

THE pear, Rousselet Stuttgart, is small, of greenish skin with a brown cheek. It ripens in mid-August in this climate. It is juicy, aromatic and sweet. Were it not that it sometimes rots at the core we should prize it among our very best Summer pears.

WE should like to hear from any of our Western contributors who have made comparative tests how much seed-wheat they would advise drilling in to the acre, and how much if sown broadcast. We ourselves have settled upon from one and a-half to one and three-quarters bushel for the former as being the quantity best adapted to our soil.

A COUPLE of typographical slips in our last issue need correction:—on page 520 £ instead of $ before 222,766 quintupled the aggregate losses of the Royal Agricultural Society by its 40 previous exhibitions. Again, on page 524, this year's total wheat crop is put down at 290,000,000 instead of 400,000,000. In both cases the context showed the slip, however.

A VALUED regular contributor writes us as follows; "I think I am the only one of your writers who keeps within the bounds in respect to length. It is easy to write long articles, but not to write so as to say everything in half the usual space. I suppose that is the reason why folks spread out." We propose, even at some sacrifice, to shorten our regular correspondence.

IN the way of fruit, one of the showiest objects at the RURAL GROUNDS at this time is the Alexander apple upon the French Paradise stock. The tree is not over five feet high and bears eight apples of the largest size. They are streaked with bright red and seem, in size, out of all proportion to the diminutive tree. Unfortunately the Alexander's beauty is its best trait. Still beauty in apples, as in human beings, covers a multitude of sins.

THE United States are fast coming to supply the world with oil. The yield of flax seed is the largest ever produced, while the yield of cotton seed oil for the present "cotton year," ending September 1st, is believed to be fully 200,000 barrels, the larger part of which has been, or will be, exported. This is not the whole product of the crop of the cotton seed, or even a tenth part of it, as the growers have not yet had their attention directed to it. The supply of castor oil is also steadily increasing from the Southwest and the crop is a profitable one.

FRESH BUTTER AT A LOW PRICE.—The best qualities of this are selling at so low a price just now, we would suggest to the producers of it whether it would not be better to salt it down in jars or firkins for Winter, than to daily force so much of it on the market. The probability is that from November on, it will rise rapidly in value, and from mid-Winter till January command 50 per cent. more in the market than it is now selling at. We speak only of such butter as is well made and sure to keep sweet, for what is likely to become frowy or rancid during Winter, had better be sold now at any price to be obtained.

TOO late to prevent its publication in the RURAL, we learn that Mr. F. L. Stewart, is sending to other journals copies of his article on Corn Sugar which appears elsewhere in this issue. There are a few men in the country who resort to such methods of obtaining free advertising by leading each paper to which they may send their incubration to believe that the article was written especially for its columns. A man of this kind may succeed once in palming off his wares on the most wide-awake editor, but he will hardly do so a second time. This method of advertising ought, we respectfully submit, to be discouraged by the agricultural press. It is not fair to those who advertise in the regular way, and pay their bills. These remarks may not apply to Mr. F. L. Stewart except in the present instance.

A FRIEND writes us: "I am now growing seedlings of coleus, gladioli and geraniums." He could not have selected three kinds of plants for seedling cultivation which are more interesting. Seedling geraniums (that is, pelargoniums properly) will prove the least compensatory. There is a *chance* of obtaining flowers equal to, or better than, any known. But the chance is *very* slight. Ninety-nine out of every hundred will prove inferior to those in the market. We have spent more time over crossing pelargoniums than any other class of plants whatever and, if we throw what we learnt out of the question, have nothing to show as the results. Seedling gladioli are often beautifully marked and will generally more than repay the trouble of raising them. As a rule, corms from seed bloom the third year. The new and beautiful strains of seedling coleus show that there is in their cultivation a good deal to hope for.

Literary Miscellany.

LOVE IN DEATH.

CORA L. NOURSE.

It was so fair, so green a Spring—
A day so filled with life and light,
I never dreamed that it could bring
The Autumn and the starless night.

I did not dream that golden morn,
With dew and song, and blossoms sweet
Could lose the fragrance of the dawn
In weary noontide's dust and heat,

I never dreamed the sultry noon
With tempest tokens darkly fraught—
I dreaded not the fell simoon
'Till all its direful task was wrought.

It came—that fearful blast of death;
It swept o'er all my garden's pride,
And in its burning, baleful breath,
All that life yields of beauty, died!

The blossoms withered into dust;
The bending skies grow cold and gray;
I murmured not, God still is just
I wait; I suffer; I obey.

LILY DAVIS.

(Continued from page 525.)

CHAPTER II.

"Hope deferred maketh the heart sick!" Lily had heard the proverb before. She was beginning to realize it now. Winter had passed; it was mid-April, and Hammond's letters were few and far between. Certainly he had an excellent string of excuses to offer when he did write, and he had sent her his photograph taken in uniform, which reposed in a private drawer; but still, though the letters were affectionate, they were unsatisfactory, inasmuch as he never alluded to any engagement between them, or hinted remotely at any public announcement of the same.

"I must wait, I suppose, and trust him," said Lily to herself; "but, oh, dear, it is hard not to see him—not to have seen him once all through these dreary months. This seat is unsteady; I shall make an undignified descent to the floor if I am not careful."

She was perched upon a high chair before a large easel in the Antique Room in the School of Art at the South Kensington Museum—a quaint, pretty little figure, in her large apron tied with green ribbons.

The curtains at the doorway swayed aside, and Mabel came through.

"Won't you come down to lunch? The bell has gone ten minutes."

Lily sprang down, and the sisters went off arm-in-arm."

The fine luncheon-room was crowded as they entered. By a stroke of luck they managed to secure a small table for two in a corner.

"What a number of coats!" said Lily, across her roll and butter. "It must be the first day of an examination; they look like cadets."

The military examinations for Woolwich and Sandhurst were frequently held at the Museum, much to the disgust of the masculine students, who on those days found themselves thrown considerably in the shade.

Two or three young men who had been sitting at a table near, with their backs towards the sisters, rose just then. One called for the account of the waiter; the second disputed the right of paying; the third seeing an uncommon face in the recess by the heavy doors, favored Lily with a deliberate and somewhat insolent stare.

Lily started, almost visibly.

"What is it?" said Mable, surprised at seeing her flush violently and then pale.

"Don't turn your head just this minute: he is looking this way," answered Lily, excitedly, in a low voice; but look, Mabel—did you ever see such an extraordinary likeness?"

Mabel had no need to ask to whom. He was a younger edition of Arthur Hammond, slighter and a shade fairer, but there were the same dark eyes, the same unmistakable mouth.

The door swung open.

"Come, youngster; you are due again at half-past one," said a voice that sent the blood tingling from Lily's face down to her toes and finger-tips.

It was Arthur Hammond himself.

He passed their table without seeing them, and laid his hand on his brother's shoulder.

"There's an awfully pretty girl behind you," she heard the young one say under his breath.

Hammond turned.

"Miss Davis! Upon my word! this is delightful. I had no idea you would be here."

Mr. Hammond spoke the truth for once. He would have carefully avoided the luncheon-room had he known whom he would meet. He sat down beside them while they finished their lunch, talking, thought Lily, as only he could talk. The brother and his companions had vanished back to their duty.

"Where do you go now?" he asked, when they rose.

"Back to the schools," said Mabel.

"Can I come too, or are gentlemen not admitted?"

"Not admitted" frowned Lilly, with mock severity. "But wait—yes, you might come to-day. It is Monday, Mabel," she added, suddenly seized with a wild desire to parade this big, good-looking officer by her side through the ranks of girlish eyes that she knew must watch them with envy.

They went through the schools. Hammond had nothing to do, and was nothing loth to be admired. It was the most triumphant moment poor little Lily had ever known. There was only one drawback—she had not the right to answer proudly to the question "Who is he?" "I am engaged to him."

But that right would be hers some day—of course it would; until then she could wait happily.

"Don't send me away alone, Lily," he said pleadingly, as they stood in the broad corridor, after making a tour of the rooms.

"Have you been over the Museum?"

"No, I'm dying to see it, and I should lose myself to a dead certainty if I went by myself. Come along, I can only stay an hour longer."

Only one hour more to be in his glorious presence, and she had hungered for the sight of him through seven months!

They went into the Museum.

"I wonder you know your way about here," he said, "with all these multitudinous stairs and doors and galleries. I am glad I have seen it, though. I shall picture your sweet little head glancing round these cases and disappearing through that archway."

They were in the Persian court, looking at the ferns. It was quiet as a dream. Not a footstep, not a voice broke the silence. Even the old attendant must have retired for a nap, and the ever-watchful policeman was conspicuous by his absence.

"You haven't forgotten me yet, then," she said, softly.

His answer was to stoop and kiss her.

"Forgotten you Lily. I shall fine you twenty for daring to suggest such a heresy."

And he took the twenty as coolly as if he had an honorable right to them.

"Have you been in London long?" she said, after a pause.

"No, I was obliged to run up to try and pull Theo through. He is a lazy young rascal. I came up on Wednesday."

"Four days ago, and you haven't been to see me! You will come before you go, won't you?"

She regretted her speech the next instant. There rose up before her a vision of their house, and their street, and "Davis's Livery-stables," in large letters over the archway leading to the coach-yard. But she need not have troubled. Mr. Hammond had not the faintest intention of going near the house.

"I am sorry, but I am afraid I shan't be able to manage it this time, my leave is so short,"—it was a clear fortnight—"and I have business matters I must attend to. Hard lines on me, isn't it? But how lucky I was to see you now, pet! I ought to be off," he added, looking at his watch. "I promised to meet a fellow in Piccadilly at four, and I have to get up here again to dine. Princes' Gate—not far from the Museum, is it?"

"Princes' Gate!" Lily looked up at him and sighed. "Yes; it is quite close. Who are your friends?" she said, wistfully.

"The Raynors. Young Raynor is in our regiment—rather a chum of mine."

"Is the father Sir Arthur Raynor, and are there two daughters?"

"Yes; why?"

"Oh! because they are at the schools—the girls, I mean—lovely girls!"

She remembered seeing a coroneted carriage waiting for them, and she had asked their names. Her information did not seem welcome to her auditor. He was rather more intimately acquainted with the youngest Miss Raynor than Lily guessed.

"They might turn up any minute—which would be frightfully awkward. Good-bye, Lily," he said aloud; "I must go—which is the way out? Down there?—thanks. Good-bye, little woman—take care of yourself."

His manner was abrupt, almost harsh.

"When shall I see you again?" she said, following him to the turnstile.

"Next Summer, I expect. Good-bye;" and he raised his hat and was gone.

She went back to the schools, and had a good cry in the cloak-room, with her face hidden in Mabel's jacket. She hardly knew why she cried. It was mingled love and longing and sorrowful regret that she was not one of the Raynor girls, who would move about their brilliant rooms that night smiling sweetly at him.

"But he loves *me*," she thought. "He kissed me, and called me 'darling' over and over again; and it will come all right in the end."

May and June passed; July came; London was hot, dusty and insufferable. They were going down to Ryde in August. In Hammond's last letter he had spoken of seeing her soon; as she entered the dining-room, rosy from reading it, Mrs. Davis met her.

"There's something in the paper will interest you, Lily, about that long-legged 'Ammond's regiment. I thought you might like to read it; not that I ever cared for 'im myself—he was a deal too tall for me."

Lily took the paper mechanically.

"The troopship 'Euphrates' is under orders to proceed to India early in September with the 200th Regiment, now stationed at Southsea. She will also carry drafts form Aldershot for the 5th Fusiliers and 4th Dragoons, now in India."

She read it twice—three times. The announcement was plain, clear, matter-of-fact. She had read similar ones before, with no more interest than she would feel in reading an advertisement column. Now her heart stood still and the room reeled round her.

Mrs. Davis had gone out; Mabel was working at the table. She pushed the paper across to her.

"He never mentioned it in his letter," she said, in a voice that made Mable drop her work to the floor and come round to her side.

"It may be contradicted to-morrow, dearie; don't fret yourself."

"But I must see him! Mab, Mab, I must see him before he goes!"

"So you will, my sweet; there is more than a month yet,"

They got down to Ryde at last. It was gay, fresh and smiling as before; surely the place of all others in which to be happy, and yet Lily was not happy.

She had not seen Hammond yet, and the time was growing so terribly short—a little more than a week to the day of sailing.

"Why does he not come?" the girl wondered. "He must have so much to say to me!"

Three days of suspense brought on a nervous headache, and she remained indoors. There were four days left now, and then he would be gone. In the afternoon Mabel came in, saying that she had seen him. She had met him by chance in the Arcade, and he had promised to look in and say "Good-bye," either to-morrow or the day after. She did not add that Mr. Hammond was playing escort to two charming girls, nor that his manner was constrained, and her own frigidly cold. Truth to tell, Mabel had begun to hate him heartily, but for Lily's sake she did not say so.

"How foolish I was to doubt him; I knew he would come—the dear fellow! I daresay he has a thousand things to worry him just now; but I am perfectly happy, Mab. Don't look like Patience on a monument—kiss me at once. How will you like to send me off to India some day?" She laughed the lightest, happiest laughter, leaning back in her chair, and clasping her hands behind her head.

By a tacit understanding Mabel took Mrs. Davis away for the next two afternoons. Lily waited alone. He did not come on the following day, though she started at every footstep outside, and a ring at the bell sent the blood tingling and throbbing tumultuously through her veins, leaving her quite faint and unsteady when the shock had passed.

The next afternoon was glorious, warm, and still. Everyone was out of doors; a dreamy quietude reigned over the house. She had put on a soft white dress, and was standing before the glass in the sitting-room, fastening a rose at her neck. A very lovely picture the lodging-house glass with its green paper gave back; a brown sweet head, small mouth, dark delicious eyes, and cheeks in which the loveliest color went and came, as she turned to catch the sound of a voice that was asking for some one at the entrance-door. It was only a visitor for the people up-stairs. She dropped on to the chintz sofa and tried to read.

"Four o'clock; he is very late. I wonder what keeps him?"

A game of billiards at the Royal Yacht Club was keeping Mr. Hammond; but it was over now, and he was coming—very leisurely, it is true, but he was coming. He was at the door now—in the room!

"Arthur!"

She sprang up, trembling with joy from head to foot, and blushing like a rosy cloud. He sat down by her on the sofa.

"Well, little sweetheart, we must say good-bye at last."

"I thought you were never coming," she murmured.

"Thought I could leave England without another look at you, did you? But I have been hard pressed for time," and he passed on to indifferent subjects, talking of recruits, baggage, berths, and winds and tides. It might be interesting to him, but it was not what she wanted to hear.

"Have you nothing else to say to me?" she asked, softly, half shyly, as he paused.

He got up and leaned against the mantel-piece. He looked very graceful in that attitude. She rose too.

"I'm afraid there isn't much more to be said," he answered lightly. "It's an awful shame I can't marry you, Lily,; you would just suit me, upon my honor. I like you better than any girl I know, but the fates are against us, little woman; I shall have to marry an heiress. I thought you knew it all along. I've only five shillings a day, and I can't live on that; but I'll give you half-a-crown, if its any use to you—it's my last coin." He held it out to her, half comically, as he spoke.

Poor child! The cruel, crushing blow fell without mercy; yet she bore it. She did not fall, or cry, or swoon, or utter one word either of grief of passionate reproach. She was simply stunned. Her very lips grew white, and her heart grew cold, cold, cold within her! Hammond felt relieved; he had rather dreaded a scene.

"It was pleasant while it lasted, Lily; but the jolliest days come to an end, you know; don't take it to heart, pet. I couldn't help myself; you have such a distracting face. Look up and give me a smile before I go. You will like some one ten times better than you like me in a month."

She shivered. The impulse was to fall on the floor, but her woman's pride conquered, and she stood still.

"I hope you will be happy, and marry some one you love?" she said, in a steady voice.

"I hope so, Lily. Think of me after I'm gone, and write to me sometimes."

"No," she said with a quick, sharp pant. Would he not go? The strain was almost more than she could bear.

He opened his eyes with a surprised air.

"You won't write to me? I didn't expect this, Lily; but if you won't, very well. Good-bye, give me one kiss for the sake of auld lang syne."

He stooped his head to hers; by instinct she put him back.

"Not now," she said; and, unscrupulous as he was, he did not dare to take it. He took his hat and went to the door, but turned and looked back before he went out.

She had sunk on the sofa, leaning back against the cushions. She was perfectly quiet, only she was looking at him.

An uneasy feeling of remorse came over him; he came across the room again, and took her hands.

"I'm awfully sorry if I've hurt you, Lily. Say you forgive me."

"I forgive you," she answered, under her breath. Heaven only knew how dear he was to her even at that moment. Then he went, and she walked steadily to the window and watched the last glimpse of his soldierly figure recede out of sight. Then she fell forward, face downwards on the floor.

* * * * * * *

Out on the blue sweep of waters the great troopship "Euphrates" was steaming slowly by. The guns saluted her from the forts. Her yards were manned; her decks were crowded with soldiers; flags were flying at her mast-head.

"Leave the Portsmouth side; come and have a last look at the dear little Island, Hammond,' said Rutherford, with an honest tremble in his voice which he struggled to master.

The two brother officers looked where the beautiful Isle of Wight lay like a glowing emerald in the sea.

"That infernal tune! why do they always play it when we leave?" said Hammond, as "The Girl I Left Behind Me" floated out from the band.

"Because each man is thinking of the one he has left, I expect," returned Rutherford. He was thinking of one very tenderly and lovingly, and wondering how long it would be before he saw her fair face again; for, until he did see it, no other face in all the world would have any charm for him. "I beg your pardon, though, *one* doesn't apply to you! How many have you left lamenting, seven?"

"About that," nodded Hammond, reflectively. "And precious glad I am to be off, I can tell you! Nothing short of India would have cleared me!"

Rutherford whistled.

"I don't like it, old fellow," he said, gravely, "I believe you have done more mischief than you think with that little Davis girl. I saw her yesterday at the window, and—well, I wouldn't like to be in your shoes!"

"What do you mean?" retorted the other, with virtuous indignation. "Confound it, one would think you thought me a villain! I haven't hurt the girl. It was only a flirtation."

Only a flirtation! So let it end. So has it ended too often in the history of life and love. Two players playing a game. The stakes, on one side a woman's heart; on the other, nothing! The result, an unruffled life for the one; silent sorrow and heartache for the other. Arthur Hammond going out in the falling sunlight, heart-whole and careless, to the gay brilliancy of Indian life, to novelty, to adventure—perhaps to glory; Lilly lying white and unconscious as the "Euphrates" sinks below the horizon line.

VARIETIES.

I AM sure what a man doeth he thinketh; not so always what he speaketh.—Bishop Hall.

THE little baby elephant is very cunning and knowing. A pleasant study for naturalists.

A MAN froze to death on the hottest day this Summer at Carroll, Iowa. He got into a refrigerator while drunk, and was locked in.

THE Russians keep fish perfectly sweet for a long time in the hottest of weather by dipping them in beeswax, which forms an air-tight covering for them.

WE should be healthier if we admitted more sunlight to our homes, as everything requires sunshine to prosper.

WHAT are called good manners are good for nothing if they are not based on sincerity.

IN Mexico they eat salt with their oranges, both because they prefer the last so seasoned, and because they are considered to be more wholesome with salt.

THE reading-room of the British Museum contains three miles of bookcases, eight feet high. The dome whence the electric light irradiates the vast room is, next to that of the Pantheon at Rome, the largest extant.

FRIENDSHIP.—Give me the friend who has the same love for me always, who is ready to "speak up" for me in the midst of enemies, and repeat what he considers my virtues as an offset to the failings they may rehearse, and who will hold fast to his faith in my truth and goodness in spite of defamation. Such friends may be scarce, but when found are priceless treasures.

HUMBOLDT states that the Chinese had magnetic carriages with which to guide themselves across the great plains of Tartary one thousand years before the Christian era, on the principle of the compass.

To be always intending to live a new life but never to find time to set about it, is as if a man should put off eating, and drinking, and sleeping, from one day and night to another, till he is starved and destroyed.—Tillotson.

THAT acknowledgment of weakness which we make in imploring to be relieved from hunger and from temptation is surely wisely put in our daily prayer. Think of it you who are rich, and take heed how you turn a beggar away.—Thackeray.

WORDS are nothing to paint a mother's love, a mother's consolations. A baby's smile contains the divinest essence of all earthly solacement; a child's love soothes without weakening; it demands so much that in blessing it one is blessed by it unawares.—Ellen W. Olney.

THE work of building the Washington monument has been resumed, after a stoppage of twenty-five years, in the presence of the President and Mrs. Hayes, members of the Monumental society and other persons. The entire party was taken to the top of the monument in the elevator.

THE views from the windows and balconies of the Catskill Mountain House are of great extent and varied beauty, taking in several States. The Hudson River, 3,000 feet below, looks like a brook. Sunrise from the Mountain House is a sight long to be remembered.

WOMEN would perhaps find it profitable if they would never trust their first impressions or intuitions. An Ohio woman dreamed that she saw her husband in the act of kissing the pretty wife of the next-door neighbor, and she awoke and struck him across the face and broke his nose. Acting impulsively gets a great many people into trouble.

A STORY is going the rounds of a worthy German farmer of Berks county, who had a shrewish wife. After many bickerings she recently announced her

intention to desert his mansion and never return. News of the occurrence reaching the neighbors, one of them called to condole with the deserted farmer, and said, "Hans, I pity you." "My boy," replied the honest Dutchman, as he disturbedly knocked out the ashes of his pipe, "you vas right. She has shust come back."

CAST A LINE FOR YOURSELF.—A young man stood listlessly watching some anglers on a bridge. He was poor and dejected. At last, approaching a basket filled with wholesome-looking fish, he sighed.

"If I now had these, I would be happy. I could sell them at a fair price, and buy me food and lodgings."

"I will give you just as many and just as good fish," said the owner, who chanced to overhear his words, "if you will do me a trifling favor."

"And what is that?" asked the other.

"Only to tend the line till I come back; I wish to go on a short errand."

The proposal was gladly accepted. The old man was gone so long that the young man began to get impatient. Meanwhile the fish snapped greedily at the baited hook, and the young man lost all his depression in the excitement of pulling them in, and when the owner returned, he had caught a large number. Counting out from them as many as were in the basket, and presenting them to the young man, the old fisherman said:

"I fulfill my promise from the fish you have caught, to teach you when you see others earning what you need, to waste no time in foolish wishing, but cast a line for yourself."

MAGAZINES FOR AUGUST.

THE ATLANTIC MONTHLY.—CONTENTS: The Stillwater Tragedy, XVIII.-XXII.; Sicilian Hospitality; Kintu; The Surgeon at the Field Hospital; Mr. Hunt's Teaching; Pepacton, A Summer Voyage; The Archbishop and Gil Blas; Sylvia's Suitors, a Little Episode; Among the Pueblos; Edward Mills and George Benton, a tale; Alien Sin; The Preceptor of Moses; An Englishwoman in the New England Hill Country; The Reed Immortal; Taurus Centaurus; The Republicans and their Candidate; Some Amusing Books of Travel; Professor Fisher's discussions; Henry Armitt Brown; Natural Science and Religion; Italian Poetry; The Contributors' Club.

A SICILIAN PALACE, by Luigi Monti.—The house we were in was one of those baronial palaces built in the fifteenth century, when many of the feudal nobility left the turreted castles on their estates, and established themselves in the cities, where they enjoyed the first honors. It had descended by inheritance to our host, and to all appearance it had never been altered from its original construction and furnishing, except in a very few articles of furniture which replaced those that had decayed. It was a square building of about seventy feet front, built of solid blocks of porous yellow stone that had become brown by age.

It had a small square in front, with a number of low, crumbling, miserable old houses, leaning one against the other, and a few poor shops in the basement: an old apothecary displayed in his window a variety of very old Sicilian majolica pots with salves of all sorts, and there was a small cafe, with a blue and white awning over the door, and two or three small tables and chairs outside under it. These houses, in days gone by, had sheltered the retainers of the feudal lord; but now they were rented, and occupied by a very common class of the population. This contrast of a superb palace surrounded by poor tenements is most peculiar and characteristic of Italian towns, especially the small ones, and those out of the way of modern influence, reminding one of the times when they were built,—times of caste and privileges; of immense wealth among the few at the expense of the poverty and degradation of the many; of a proud feudatory lord, exacting and enjoying the fruits of the labor of thousands of vassals, over whom he held sway as sovereign master.

The front entrance formed an archway which led to an interior court-yard, in the center of which stood a very old granite fountain, with wide basins for horses to drink out of. By hereditary custom it was also used as a public dispenser of water to all the poor of the neighborhood, whose ragged children were constantly coming in and out to fill their earthern jars. The whole basement of the palace opening into this interior court-yard, which in feudal times received the armed retainers and their horses, the granaries and kitchens, was now turned into stables and carriage-houses, the washing and cleaning of which was done in the court-yard itself, near the fountain, making it a scene of bustle and dirt, rather unpleasant to one not used to it.

On the right of the archway of the entrance was a marble staircase leading to the family apartments, or *quarto nobile*. In the hall were several doors leading to them, the rooms being all on the same floor, opening one into the other. Our bedchamber was of a very peculiar construction; it was divided in two by an alcove in the middle, having on each side a paneled door leading into two dressing-rooms, both the alcove and dressing-rooms opening into the back of the chamber, which had a space as large as the front, with two windows looking out into the court-yard, and containing wardrobes and chests of drawers. The front part had two balconies over the square, and was quaintly furnished with old rococo furniture very much worn; the floor was paved with glazed tiles and had no carpet, except an Oriental rug here and there. The rooms were furnished in the style of the sixteenth century; they were high studded, with fresco paintings of mythological subjects, now almost faded by age and dampness; high paneled doors of white and gold—the white turned to a dusty gray, and the gold to a dark yellow; there were old portraits of knights and magistrates, ancestors of our host, and an air of antiquity about everything that was charming to see.—Atlantic Monthly.

DEMOREST'S MAGAZINE; Butterick's Delineator and Domestic Monthly for August are at hand. They are presented in their usual form but contain new matter. The fashions are displayed with taste and the literary department is filled with articles of interest.

There are many hints to be gotten from these well conducted journals.

BRIC-A-BRAC.

A SELECTION from Dr. Tanner's correspondents:

My dear Doctor Tanner:
If you fast in this manner
And live without hash
Our business will smash.
With tears in my eyes,
That you live upon air—
I ask is this fair?

Suppose every guest
Should just do his best
To accomplish your feat
And ask nothing to eat?
I'm sure they wouldn't pay,
For each one would say
"My last week is paid,
And board bills are played."

But if you'll die in season
They'll come back to reason,
And then they will take
All the hash I can make.
Therefore, my dear friend,
Bring this fast to an end,
And prevent the grief deeper
Of—

A BOARDING-HOUSE KEEPER.

A FARMER'S wife, in speaking of the smartness, aptness and intelligence of her son, a lad six years old, to a lady acquaintance, said: "He can read fluently in any part of the Bible, repeat the whole catechism, and weed onions as well as his father." "Yes, mother," added the young hopeful, "and yesterday I licked Ned Rawson, throwed the cat into the well and stole old Hinckley's gimlet."

DOWN by the river side they met,
Sweet Romeo and Juliet,
Her hand in his he placed and said
"Sweet Juliet, I would thee wed."
"Indeed?" she queried, "Ah! let's go;
Get in this boat. Oh! Row me, oh!"
—Joaquin Miller.

Two grammarians wrangling, one contending that it was only proper to say, "My wages is high," while the other noisily insisted that the correct thing was, "My wages are high." Finally they stopped a day laborer, and submitted the question to him. "Which do you say, 'Your wages is high,' or 'Your wages are high?'" "Oh, off wid your nonsense," he said, resuming his pick, "yer naythur ov ye right; me wages is low, bad luck to 'em."

WHEN asked what town he hailed from
His reply to Peter shall be:
"I starved to death in Gotham,
And my name is Dr. T."—G. W. Childs.

POSTMASTER JAMES received a letter from Norwich, Conn., on which was the following address: "Mr. Colton, 'the tooth Puller,' somewhere in the Cooper Institute Building better known as the 'Gas Man.' Will the genial Col. James see that he gets this. New York City."

APPLE DUMPLINGS from the pot,
Just a dozen, steaming hot;
And the old man, convalescent, says the grace;
Then he takes them, one by one,
Eats eleven, while his son
Sees them disappear with horror on his face.

When the sick man takes the last,
Speaks the little boy, aghast,
"Pa, I haven't had one dumpling—nor has ma."
"What!" the old man cried, amazed,
While he dropped his knife and gazed,
"Would you take the last one from your poor,
sick pa?"—Petroleum World.

FLY TIME—When you hear her father's heavy cane thumping along the hall.

I'LL tell you a story that's not in Tom Moore:
Young love likes to knock at a pretty girl's door.
So he called upon Lucy—'twas just ten o'clock—
Like a spruce single man, with a smart double knock.

Now, a handmaid, whatever her fingers be at,
Will run like a puss when she hears a rat tat;
So Lucy ran up, and in two seconds more
Had questioned the stranger and answered the door.

The meeting was bliss, but the parting was woe;
For the moment will come when such comers must go;
So she kissed him and whispered—poor, innocent thing—
"The next time you come, love, pray come with a ring!"
—Tom Hood.

A VENERABLE lady of a celebrated physician, one day casting her eye out of the window, observed her husband in the funeral procession of one of his patients, at which she exclaimed: "I do wish my husband would keep away from such processions—it appears too much like a tailor carrying home his work."

As Dr. Tanner has received the business cards of most of the undertakers in town, so a young lady about to be married receives an indefinite number of curious circulars. One of these, recently sent by a dentist, is delightfully suggestive: "Having heard the happy news of your approaching marriage, I have the pleasure of offering you my services in setting your teeth in complete order, as per annexed schedule of prices. This operation, which is useful in all ordinary events of life, is indispensable under the present circumstances. The first impressions of married life are ineffaceable and their consequences of the greatest gravity. I therefore cannot too strongly advise you to have your teeth thoroughly cleaned by a skillful and conscientious practitioner."

For Women.

CONDUCTED BY MISS RAY CLARK.

THE SOFT "NO."

YOUNG Kitty sat knitting. "My darling," I said
"I've had a most beautiful dream!
Shall I tell it?" She gave a slight shake of the head,
And answered: "I'm turning the seam!"

I reached for the mesh, speckled soft like a pink,
That she held in her fingers so small,
But she answered: "I can't leave my work—only think
I'm knitting a sock for a doll."

"Don't tease me so, Kitty, my dear little one—
You are dying to hear—I'll be bound!"
"Just wait," she said, smiling as bright as the sun,
"Just wait till I've knitted a round."

I waited impatient, and then I drew near,
And pushing the curls from her brow,
I said: "Are you ready my Kitty, my dear?"
She answered: "I'm narrowing now!"

Still nearer I drew—put my arm round her waist—
And breaking of silence the seal,
Repeated: "Dear Kitty! why, what is your haste!
She answered: "I'm setting the heel!"

I smiled, and I frowned—I looked up at the clock—
At the coals 'neath the forestick aglow,
And then at dear Kitty—she held up the sock,
Saying: "Would you put white in the toe?"

"You *shall* hear me, Kitty, you dearest of girls,
And then, if you will, you may scoff!"
She shook loose the hand I laid on her curls,
As she said: "I'm just binding off!"

"I dreamed of a cottage embowered with trees,
And under the bluest of skies—"
She checked me with: "Sit farther off if you please,
My needles will get in your eyes."

"I dreamed you were there, like a rose at my door
And that love, Kitty, *love*, made us rich!"
"I told you to sit farther off once before!"
She answered: "I'm dropping a stitch!"

She knitted the last, and had broken the thread
When I cried: "Am I only a friend?
Or may I be lover?" She quietly said:
"Pray wait till I've fastened the end!"

"Will you marry me?" Here the worst came to the worst,
There was nothing to do but to go;
For I learned at the last, what I might have known first,
It was all her soft way to say "No!"

A LETTER TO LOVERS.

PERHAPS never before in your life did the horizon of your future look so bright as now when glorious anticipations pierce the dawn of a new life and everything is viewed in the rose-hues of the morning.

You don't care to think of the mid-day heat, the clouds, the tempests, and the evening shades; and perhaps it is just as well to let that distant part of your future remain in the back ground, for I never had much sympathy for people who go after trouble.

But, prudence, that happy medium between thoughtless abandon of cares and the nervous watching and nursing of them, is, I fear, too little exercised in matters matrimonial. To consider your first appearance in society synonymous with falling in love and getting married, or to get acquainted with your ideal in some romantic way and consider yourself fated instead of asking yourself whether you are suited, are just such mistakes as young, careless lovers are likely to commit. In both cases marriage is a lottery. You draw your ticket of chance eagerly, hopefully, but without thought, and consequently find it very often a blank of disappointment.

Our counsel is not against love at first sight, but against the delusions of a short-lived fancy. Let your hearts at all times decide your choice, but first be quite sure that that heart is right. That it is not misled with beautiful visions of magnificent drawing-rooms, servants and carriages. That it is not deluded with the ideal fleeting fancy of love in a cottage.

This may read well enough in stories, but your life is too earnest to let your imagination carry you away from its stern realities. The luxury of wealth will never compensate you for the loss of happiness. The dreams of your fancy will never satisfy the gnawings of hunger. And above all, a shallow, imagined love will never endure the test of time and adversity.

"They are a splendid couple." How well that sounds as, on your bridal day, you catch that whispered remark from some admiring friend. But do they know and (unless your choice has been made with proper deliberation) do you know that the "match" will be as mutually agreeable as "splendid?" Have devoted lovers never proved selfish, indifferent husbands? and fascinating girls never changed into careless wives? Or do you think that because it is you and not some one else such experience would be spared you? There's many a palace holds a wealth of unhappiness; and many a rose-embowered cottage full of discontent. Yet their inmates had just such thoughts, and many after you will flatter themselves into the same delusion. Before marriage you look through the rose-colored spectacles of your imagination and find everything very beautiful. After marriage you see only through smoked glasses and all has changed into commonplace drab. But when you learn to look at it with bared eyes, without your imagination or your prejudice to color it brighter or darker than it really is, then you may safely estimate your lot in life.

Half the disappointments in married life are caused by the hasty, thoughtless union of ill-matched, half-suited couples and the disagreements accruing therefrom.

It would be well, therefore, if, during the progress of courtship, instead of idle talk and senseless flattery, you would diligently study each others character by exchanging ideas and opinions, in order that when you are husband and wife you may be so well acquainted with each others tastes and bent of mind that no disagreement can possibly come between you to mar that first happiness which should last through life.

In contemplating marriage make sure of three things.: first, that you are really in love; second, that you thoroughly understand each other; third, make up your mind that you will not only live with, but *for* each other.

Thus, with mutual devotion, kindly forbearance with faults and a confidence in each other which no meddling gossip can shake, you have every prospect of a happy, prosperous and harmonious life.

BERTHA A. WINKLER.

RULES FOR VISITING.

As a general rule, never invite yourself to stay with any one; do not take such a liberty even with a near relation. Many persons have a habit of making unexpected appearances; they should remember that intrusions of this kind are sure to be more or less resented, and they run the risk of making themselves unwelcome guests. Others in an off-hand manner announce their intention of paying a visit, thereby causing a considerable amount of embarrassment; for though the host may not be averse to the self-invited guest's society, yet the liberty taken may cause great inconvenience.

Be not less particular that you do not take a stranger, or an uninvited person, with you when you pay a visit—unless, of course, you are specially requested to do so. If it should happen that you receive an invitation at a time when you have a friend staying with you, write by return mail declining the invitation, giving the presence of your friend as the reason for your doing so. It is then the province of the giver of the invitation to write and extend the invitation to your friend also. Then you may accept; but do not take the initiative yourself and say you would be glad to come if you could bring So-and-so with you; as your host may be so circumstanced that to say "yes" or "no" would be equally disagreeable.

A considerate visitor will be careful not to keep his host and hostess up to a later hour than that at which they habitually retire. Thoughtless persons frequently occasion much vexation and inconvenience in this way.

In many houses there is a tacit signal that bed-time has arrived by the appearance of a tray with wine, soda-water, biscuits, etc. After partaking of this light refreshment, candlesticks are handed round among the ladies, who then retire to their own apartments. Gentleman leave the drawing room at the same time; and for them it is permissable to adjourn to the smoking-room for a short time before retiring for the night—this of course, is quite optional, and does not entail the presence of the host.

When staying at a friend's house, a visitor should never take a book from the library to his own room without requesting permission to borrow it. Many people place the highest value on their literary possessions. When a book is lent, care should be taken that it sustains not the slightest damage, either within or without.

No guest should be continually dependent upon her host for entertainment, but should throw her self upon her own resources, and endeavor to amuse herself as much as possible, and should remember, that however welcome she may be, her presence is not *always* wanted.

From breakfast to luncheon, as a usual thing, visitors should not expect any attention from host or hostess. Both require some time in order to make necessary arrangements; many matters may require the supervision of the hostess, while the host avails himself of this period to occupy himself with his personal concerns. The visitor, too, finds this a convenient time for writing, taking a stroll, reading, etc., in fact, do anything in reason, except look for any attentions from her entertainers during this portion of the day.

ANOTHER ANSWER.

IN the RURAL of July 24th, "Miss Irene," asks: "Who seconds the motion that some married sister, who knows how, will give these husbands a 'drawing over the coals?'" And, I think it quite proper, perhaps, that a married sister should do the experimental cremating, if any such thing is on the tapis; but first let us stop to consider the sort of "work" we have in hand before we "seal the contract."

There is a certain class of readers who raise a great "hue and cry" about the poor abused farmers' wives, but, be sure, it is never the farmers wife who does the complaining; rather some vinegared spinster, whose chief claim to public attention is a sharp pen and a shrill voice. It is seldom the strong, healthy, helpful soul that grumbles. The army of faultfinders is usually composed of those whose lives have been dwarfed and soured by circumstance, or, more truly, being narrow, life and outward circumstance meet them on that plane and return like for like.

Life generally is to each of us just what our own individuality can reach out and claim. The atmosphere about us is what we make it from our inner selves, and we see the world through rosy mists, or "jaundiced eyes," just as our own optics chance to be constituted. But this is not singeing the toes of the poor offending husbands as we swing them too and fro over our bed of coals, and when we come to think just how badly the poor fellows would feel, we believe we will decline the office in favor of some better executioner.

As for the matter of bad farmer husbands I don't really know that they are any better, or any worse than the wives! Of course, there are coarse men, those regardless of the welfare of their wives or children, or in fact of anything but their own selfish ego, and there are also women very little better. But there is no use to cry out about the brutality of mankind. That never made over any man; no harangues from a woman ever cured a man of any coarseness! If we would labor to elevate mankind, we must begin at the root of the

tree; no after pruning can ever make a Bartlett pear of a thorn seedling.

Better we should let the grown husbands pretty much alone, if they be selfish, they will assuredly be selfish, still; if kind and good they owe their dispositions to something more than their own endeavors, and woman can better employ her time and thoughts, her voice and pen, in teaching the mothers of unborn millions, the one true way of making kind and considerate husbands or wives for some future time.

Many farmers' wives work hard, it is true, so do the wives of all men who are not financially above the need of manual labor.

I have lived on a farm, I have also lived in cities, both great and small, and I know that few women of limited means are as happy, live as easily and pleasantly, as the wives of farmers. Through the large, roomy houses, with all the living rooms on the first floor, floats the sweet Summer breezes, ladened with the scent of new-mown hay, or spiced from the long orchard reaches, and the red cheeked babies, revel in pure air, fresh fruit, and cool, pure milk, unmixed with chalk or water. All places have disadvantages, as well as advantages, but we sometimes waste uncalled for pity.

MAUDE MERIDITH.

OUR GIRLS AND BOYS.

MISS CLARK:—I have recently chanced to hear the remark made that the present training of boys and girls was one of the crowning evils of modern times. That neither were brought up to much of anything but fashionable idleness, with some smattering of the "accomplishments," but little of the downright drilling to the pursuits of every-day life.

The remark was further made that parents were bringing them up in an atmosphere above severe labor, while the cultivation necessary to fit them for easier pursuits was not yet practicable.

But while this may be a very prevalent belief, may I not ask what is being done to advance that cultivation? Is it wrong for parents and children to struggle for that cultivation?

Because a portion fail in accomplishing it, shall every boy and girl be doomed to drudgery until the millennium brings the grand time?

I would not entirely relieve the son or daughter from the parent's daily duties, but if in connection therewith, the daughter may have music, and an opportunity to develop what ever taste she may have for the little creations in art, or for any original composition, or a knowledge of botany, floriculture, and of making her own dresses and bonnets, may she not be advancing a step with no evil effects upon her womanly character?

The common schools do not teach the boy much of practical workmanship, and if in addition to his daily task he has tools and instruction in their use, and is given a broader knowledge of intellectual affairs, so far as the study of natural history and the physical sciences, as well as an acquaintance with business, may he not be advancing a step from the past?

Should the children be kept from attempting to advance for fear that they may turn to easier pursuits? H. H.

GIRLS' MANNERS.

IF our little girs greet their brothers and sisters and perhaps even their parents boisterously; if, instead of "Good morning," they cry, "Halloo, papa! Hallo mamma!" and call to playmates in the streets in the same rough manner, who will be surprised if this style follows them as they grow up and appear as young ladies? Referring to this unladylike manner and mode of address, a gentleman writes that, passing two pretty, well-dressed, stylish-looking young ladies in the public streets, he was surprised to hear one greet the other with, "Halloo, Sid!" and the other respond "Halloo, Tude!" to her friend's greeting, and he remarks: "It was just what two lounging young men might have said, or stable boys, for that matter. It might not have been so much out of the way for the latter, but I confess it sounded very odd and offensive in what I supposed to be two well-bred young ladies—as much so as if I had heard two beautiful, gay and rose-colored birds begin to swear. It was so unnatural, so out of place. It may be 'the style' for young girls or ladies to greet each other with a 'Halloo!' but I can't like it or get used to it." These things may seem but a trifle, but they make all the difference between nice things and very common things.—Christian Union.

HINTS.

A SWEET temper is to the household what sunshine is to trees and flowers.

THE young lady who can peel a potato in five seconds is as useful as the young woman who speaks five languages is ornamental.

NEW PAINT.—Newly painted rooms are very unpleasant for many days, but if a handful of hay be strewn on the floor upon which is sprinkled a little chloride of lime, after a couple of hours the offensive smell will have entirely disappeared.

VARNISHED FURNITURE.—This may be finished off so as to look equal to the best French polished wood, in the following manner:—Take two ounces of tripoli, powdered; put it into an earthen pot, with just enough water to cover it; then take a piece of white flannel, lay it over a piece of cork or rubber, and proceed to polish the varnish, always wetting it with the tripoli and water. It will be known when the process is finished, by wiping a part of the work with a sponge, and observing whether there is a fair, even gloss. When this is the case, take a bit of mutton suet and fine flour, and clean the work. The above process is suitable to other varnished surfaces.

RICE GLUE.—Mix together rice-flour and cold water to a thick paste, pressing out all the lumps with a spoon, and making it very smooth. Then dilute it with a little more water (altogether you may allow a gill of water to a tablespoonful of rice-flour) and boil it slowly as long as you would boil starch, stirring it frequently. When done, set it to cool. Use it for pasting fine paper, and for any little ornmental articles made of pasteboard. It is a very nice and durable cement. The water in which rice has been boiled for the table will afford a cement for slight purposes.

HOW TO COVER THE SICK.—Never use anything but light blankets to cover the sick. The heavy, impervious counterpane is bad, for the reason that it keeps the exhalations from the pores of the sick person, while the blanket allows them to pass through. Weak persons are invariably distressed by a great weight of bed-clothes, which often prevents their getting any sound sleep whatever.

TO FRESHEN A BLACK LACE BARBE.—In a half teacupful hot water put one teaspoonful of the magical mixture; brush the dust from the lace and place on a clean towel; dip a small sponge in the water and squeeze partly dry, and then gently and slowly sponge both sides of the barbe without getting it very wet; fold in the towel about 20 minutes, and then place between thin, tissue-like brown paper; put it on a woolen blanket and press with a half cold iron; or you may press between the leaves of very large books and place heavy weights on them.

TO REMOVE DANDRUFF.—This is a natural secretion, but becomes a cutaneous complaint by neglect. Take an ounce of powdered borax, a piece of unslacked lime the size of a chestnut, and a tablespoonful of spirits of ammonia; put them into a quart bottle and fill it up with boiled or pump water. After twelve hours apply this wash to the scalp. Ladies can apply it best with a fine sponge. Rinse with tepid water. After a few applications the scales will disappear, the hair become soft and brilliant, and young hair will be seen to start out. Dandruff should be cured gradually, so as not to produce sick headache or dizziness by its sudden suppression.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

BREAD MAKING.

ELINOR BROOKS.

VETERAN housekeepers are weary of so often seeing directions for bread-making, sometimes forgetting that there are new recruits constantly enlisting in our ranks to whom the subject is most interesting

An old friend tells me that in her newly married days she shed more tears over her failures in bread-making than over all her other housekeeping troubles together. During a late visit to her she gave some discouraged young housekeepers a laughable history of her trials in that line.

After becoming ashamed of her frequent failures she had sometimes slyly hidden away the solid loaves—once in the deep grass of the meadow where soon after with a mowing machine the hired man cut through a moldy mass and at first thought he had made a valuable discovery of a new species of mushroom. She knew very well that it would not require many such blunders to stamp "Jack's wife" as a shiftless, extravagant "piece" in the eyes of her critical new relatives; so the next time, after hours of anxious waiting and watching for the stubborn loaves to rise, she resolved to hide them where they never would be found again, and after the men were all safely off to their work she fed the heavy unbaked mass to a couple of fine pigs which were her husband's especial pride just then. When night came, at the time the pigs were usually squealing for their supper she was frightened to find they were nowhere in sight, and her guilty conscience instantly suggested the fear that the sour dough had swollen and killed them, perhaps ruptured their stomachs. Her husband, tired with a hard day's work, never noticed their absence and was soon asleep, but her anxiety was too great to allow sleep, and at midnight it became so unendurable that she stole away from the side of the unconscious sleeper and searched the pasture over in the moonlight, but could find no trace of the missing pets. Imagining Jack's consternation and grief when he should find their bloated remains she became thouroughly alarmed, and, hastening to the house, roused him and confessed her dreadful secret, imploring him to go out and find them and see if there could not be something done for them before it was too late. His shouts of laughter on hearing her story startled the whole household from their slumbers and so reassured the anxious woman that she lay down and slept in peace. The pigs were found next day *safe in mischief* in a neighbor's potatoes.

After all of auntie's trials and failures she is a noted bread maker, and is especially famous for good yeast-cakes, with which she supplies many of her neighbors, who much prefer them to any *store yeast cakes* that can be found. She only makes them twice in the year as they keep perfectly good for six months and more. As good yeast is the first and most important element of good bread, we are all trying to learn her secret, and this is the way she tells us to make

Good Yeast Cakes.

At night make a sponge of flour, a pint of warm water and two yeast cakes that you are certain are sweet and good. In the morning boil for one-half hour two quarts of loose hops in water enough to cover them; then strain out the hops and into the scalding liquid stir all the corn-meal that it will wet up. When the meal is luke-warm mix in the bowl of light sponge and let it stand from one to two hours to rise. When light, pinch off little pats, shape them into cakes and lay them on the molding board to rise again. When light, set the board in an open window or other airy place, and turn the cakes quite frequently for two or three days, until they are thoroughly dry; then pack away in paper bags.

For Bread.

At night make a sponge with a yeast cake and two quarts of fresh milk that has been scalded and partly cooled. In the morning (early if possible) stiffen the sponge with flour, stirring it in at first with a spoon, then using the hands, kneading in flour until the dough no longer sticks to the fingers, and then kneading with as little additional flour as possible for twenty minutes. Set to rise again, then knead again just as long as you can afford the time. The longer it is kneaded the more tender and fine-grained the bread will be. After the second kneading place it in the baking-tins and let it rise until it nearly doubles in size; then bake from forty minutes to one hour according to the size of the loaves.

Salt Yeast Bread.

Many housekeepers who really prefer salt-rising bread seldom make it on account of the extra care they think it needs, saying that "one has to keep a fire all day for that kind of bread." But that is a great mistake. It can be easily managed so that it can be baked in the forenoon. Late in the evening a half pint of warm water, a salt-spoonful each of soda and salt should be stirred into a thick batter with canaille or coarse flour—which always ferments sooner than fine flour. Cover the dish containing the yeast with a saucer or small plate, then set it in a kettle of warm water and cover the kettle closely so as to confine the steam. When one has a reservoir attached to the stove it is a good plan to set the dish of yeast in it. In the morning there will be no apparent change in the yeast, but after stirring in a little warm water and more flour, and reheating the water in which it stands, it will soon show signs of fermentation, and in about two hours will be ready for sponging. The sponge should be made with milk and should stand about an hour; then it may be molded for the pans, being careful not to add too much flour as it easily absorbs enough to make it too stiff. Unlike hop yeast bread, it requires but very little kneading (the less the better), and therefore this is an easier method of making bread for women who are not strong.

NURSING CHILDREN.

I DON'T believe in the way mothers take care of their children now-a-days. Lots of little creatures die just because they are dosed and doctored to death. I suppose parents love their children as well now as they did when I was young. But seemingly, more are sick and die now than then, and I do believe it is all mismanagement that makes the difference. This feeding children upon pie and cake is a grave mistake. If they happen to have the stomach-ache or colic, a doctor is sent for and more serious illness follows. Mothers ought to know what should be given to their children both for food and medicine. If they would only study the *comfort* of the little ones they would save much suffering. I will give a few simple remedies for every-day use.

Croup.

Take a soft flannel cloth, a quarter of a yard long and a finger wide; spread a thin coating of lard over it, and sprinkle yellow snuff over the entire surface. Lay it over the chest, the lard and snuff next the skin. Spread another flannel over it. This will loosen the tightness, and give relief. Grown-up people, as well as little folks will find it an excellent remedy for tightness or congestion of the lungs.

Burdock Leaves.

For a sudden attack of pleurisy, nothing will give relief more speedily than burdock leaves applied to the seat of pain. If green, boil them, and steep in vinegar and apply hot; if dried leaves are used, remove the stems and steep in vinegar till soft and hot. Have enough prepared to change as they grow cold. A few minutes' application will remove the pain. Some hot ginger tea should be drank to allay the internal heat.

For Worms.

When children have symptoms of worms, sage tea will generally give relief. A drop or two of spirits of turpentine rubbed across the stomach will prevent their rising in the throat.

GRANDMOTHER.

DOMESTIC RECIPES.

Dried Beans for Winter Use.

Pick when tender; wash and string them: then throw them into boiling water and let them boil up. Skim out and dry them as even as possible. When wanted for use, throw them into boiling water and cook until tender, seasoning in the usual manner. One teacupful of the dried beans will be sufficient for a family of five.

Brine for Cucumber Pickles.

Three large wooden pails of water; four quarts of salt; three-fourths of a pound of alum; one half pound of cracked black pepper. Boil the ingredients in a part of the water and skim off all that rises to the surface. Wash and scald the cucumbers, leaving them in the water in which they have been scalded, until perfectly cool. Mix the remaining water with the other ingredients and pour over the cucumbers. When you wish to use them, you have only to take them out of the brine and pour boiling water over them, letting them remain until the water becomes cool, then throw them into spiced vinegar if you like, and they will be ready for eating in a day or so.

Making Vermicelli.

One quart of flour; one level teaspoonful of salt; two eggs, and a very little water. Mix and divide into five equal parts; then roll out very thin and spread upon a clean napkin to dry, but do not allow them to become brittle by overdrying. Prepare this about three hours before meal time, and about one hour before you wish to use it, take the partially dried sheets of dough and lay them upon the kneeding board, flouring well the upper side of the sheets. Then roll them from you so as to form a flat roll about one and a-half inch wide. Take a short, thin knife and cut very fine across the roll; after you have cut them all in this manner, take them up carefully and shake them apart, leaving them to dry again, until about five minutes before you wish to serve the dish. Have ready any good soup stock, boiling-hot; throw in the Vermicelli; cook five minutes, stirring constantly. This quantity of Vermicelli is sufficient for a large kettle of soup.

Layer Cake.

One cup of butter; two cups of white sugar; one cup of sour milk, four eggs, one teaspoonful of saleratus, three cups of flour. Take one half of the butter and put into it two tablespoonsful of molasses, one teaspoonful of cloves, cinnamon and allspice, one nutmeg and one cup of chopped raisins. Bake in jelly tins, using the dark part for three of them, while the light part will only require two tins.

MRS. E. H. SARGENT.

To Clean a Sponge.

The quickest and cheapest method for cleansing a sponge, is to wash it (squeeze and knead) in strong salt water. MRS. W. V. A.

Corn Fritters.

Grate corn from the cob until you have one quart, add two teacups of sweet milk, two beaten eggs, one teaspoonful of soft butter, one teacupful of flour, having a teaspoonful of yeast powder mixed with it. Season with pepper and salt and fry upon a griddle like batter cakes.

Corn Pudding.

Take the grated corn of a dozen large ears, add a quart of milk, three beaten eggs, two tablespoonsful of melted butter, a tablespoonful of sugar and a small teaspoonful of salt. The eggs should be beaten separately and the whites stirred in the last. Pour into a baking dish, cover and bake an hour. Remove the cover and brown before serving.

Peach Figs.

Remove the skins, halve, take out stones and to eight pounds of the fruit allow three pounds of brown sugar. Put over a slow fire—do not add water—and cook until the sugar penetrates and they have a clear appearance. Take out, spread on plates and dry in the sun. Save the sirup and sprinkle on a little while drying. Pack in boxes in layers with a little powdered sugar between. MARY B.

Ripe Tomato Pickles.

Do not scald, pare with a sharp knife. Put into a jar and pour over hot, spiced vinegar. Cover over with paper dipped in flour paste.

L. D.

NOTE FROM MRS. B.—I am afraid I shall not be able to write again for some time, as this month we expect to commence building a new house, and I shall be very busy. I think you will be gratified to learn that we are following the house plan given in RURAL of May 22d, (except that we have modified it somewhat to suit our taste and means.) I search the RURAL anxiously for any hints there may be on building. Would be very glad to have the "sisters" give any improvements or convenience they may know of for pantry, kitchen, or, indeed, for any part of the house, as I am a novice in house-building, and am exceedingly anxious not to make any serious mistakes in the construction of the home wherein I now hope my future life will be spent.

Hop Bitters gives good digestion, active liver, good circulation and buoyant spirits.

News of the Week.

HOME NEWS.

MONDAY, August 16, 1880.

Mr. Dudley Field, son of David Dudley Field of New York, died suddenly of heart disease on the 10th.....J. W. Hornninger, a juryman at Richmond, Va., refused to serve because there was a negro upon the jury, and was fined $2 50 and 10 days imprisonment.....The Fourth annual convention of the National Liberal League will be held at Chicago on the 17th of September..... Godfried Allentz, a German gardner living near Indianapolis, Ind., fastened himself in a room of his house and set fire to it burning himself to death.....New Orleans is making extensive preparations for celebrating the recent opening of direct railway communication with Texas..... A new line of railway is arranged for from Matamoras to Monterey in Mexico to connect with the Texas roads .....Extensive preparations are in progress for new lines of roads on the west bank of the Hudson river.....Mrs. Anna Maria Sutterl of Trenton, N. J., committed suicide in a fit of melancholy on the 12th.....Alphonso Klock, aged 19, has been held for murder in the first degree for shooting Moses C. Holden of Herkimer, N. Y., on the 8th.....The buildings belonging to Charles D. Wise of Washingtonville, N. Y., were burned on the 11th, and his son aged 13 years has been arrested charged with the crime.....Roger Russell of Layfayette, Mich., shot his son-in-law, John Munan on the 11th inst.....Walter Hawk, a miner, was killed on the 12th inst., by falling down a shaft at Wilkesbarre, Pa..... Indian depredations are reported at Quitman, Texas.....The Bankers' Convention at Saratoga is exhaustively considering questions pertaining to the finances of the country, and it seems to be the prevailing opinion of that body that the Silver Coinage act must be repealed, and the silver dollars remelted into bullion in order to be disposed of..... ...There has been a net increase of 2,134 in the number of new post-offices established in the United States during the year ending June 30,.....A tunnel under the St. Lawrence is decided upon.....Alfred Ward was drowned while fishing at Red Bank, N. J., on the 11th inst. .....James McDonald was instantly killed by the falling of an arch at Boston on the 12th inst. .....Mary Haggerty, Daniel Bagley and Julius Mair, were drowned at Neversink, N. J., on the 9th inst.....Mrs. Charles Wells of Woodtown, Pike county, N. Y., met and killed a rattlesnake on the 10th, measuring five feet in length..... A consolidation of the Texas Pacific with several other roads in the Southwest is under consideration.....$250,000 worth of property was destroyed by the burning of oil boats at Greenpoint, L. I., on the 10th inst...

SEVERE RAILROAD ACCIDENTS.

The breaking of an axle of a tender two cars of the New York and New Jersey Railroad were on the 12th, thrown from the track down an embankment 30 feet in hight, and seventeen passengers more or less injured. The accident happened near Spring Valley, Rockland County, just after passng a sharp curve. The ladies' car was turned entirely over, and it seemed almost a miracle that none were killed.....A collision occurred on the West Jersey Railroad at May's Landing on the 11th, from the failure of the air-brakes to work, by which fifteen persons were killed and over fifty wounded.

The eldest daughter of Hon. N. P. Banks was married to Rev. Paul Sterling, at Waltham, Mass., on the 12th.....Trouble has broken out between the whites and negroes in some parts of Southern Indiana, supposed to be of a political nature.... ....A daughter of Maturin Livingston, of New York, was married at Newport, on the 12th, to George Bentinck, son of Mr. Cavendish Bentinck, Member of Parliament for Whitehaven, England

POLITICAL.

The State Credit Democrats of Tennessee in convention on the 12th, nominated Judge Wright for Governor. The low tax convention met on the 12th, and nominated Hon. S. F. Wilson for Governor..... .The Texas Democratic State Convention met at Dallas on the 12th, and nominated candidates for Judge and Attorney-General.

MORE INDIAN TROUBLES.

Dispatches from New Mexico report some serious fighting with the Indians in that Territory. Gen. Grierson reports that while guarding the passes east of Van Horn's Well, and scouting toward the Rio Grande to prevent the Indians passing eastward toward the settlements, the latter escaped, slipping through and going north on the evening of the 4th inst. Gen. Grierson got his force in readiness and moved to the northwest, keeping a range of mountains between him and the Indians, thus concealing his movements. He left the camp, south of Van Horn's, at 3 o'clock on the morning of the 5th, and arrived at Rattlesnake Springs at 12 o'clock the same night, marching 65 miles in 21 hours. Arriving there, he found himself in advance of the Indians. At 2 o'clock on the afternoon of the 6th the Indians were observed moving toward the Springs. The troops fired by volley, creating great contusion and a general scattering among the Indians. From a high mountain the Indians perceived the smallness of the force opposed to them, and advanced to the attack, trying to work their way to water. After firing a volley they fled to the mountains. At 4 P.M. the supply train, supported by Capt. Gilman and a company of the Twenty-fourth Infantry, appeared about eight miles southeast, coming around a point of the mountains. The Indians sent out a party to attack it, but were again repulsed, and retreated to the main force. At this time a party of Indians was seen coming down the canon between the troops, with the intention of attacking the train and getting to the water. They were also driven back. The Indians retreated to the Corissa Mountains, pursued by the troops. Gen. Grierson says it is impossible to tell the loss of the Indians, owing to the nature of the country. Many were shot from their horses. Capt. Nolan's command is now watching the canon, and Capt. Carpenter, with his force, has gone to Sulphur Springs and Water Holes, about twenty miles from Rattlesnake Springs, these being the only ones where the Indians can obtain sufficient water. The soldiers suffered no casualties. Capt. Liverman, with a company of the Eighth Cavalry, is now on his way to join Grierson.

A courier from Capt. Kennedy brings the report to Grierson that a detachment of troops had an engagement while following the Indian trail into a canon north of Bowen Springs, in Guadeloupe Mountains. The troops lost one killed and nine horses shot. The loss of the Indians is unknown. Capt. Kennedy at once moved out to attack these Indians. Col. Vielle, with 200 Mexican troops, is now opposite Fort Quitman, watching for a band of 50 or 75 Indians, who are supposed to have left the main band of Victorio. This is the same band that attacked the coach on the 9th, compelling it to return to Fort Quitman, and wounded one passenger.

WASHINGTON, Aug. 10.—Adjt.-Gen. Drum is in receipt of telegrams from Eagle Springs stating that, from further investigation and observation, and the large trail made by Indians going to and returning from Rock Ridge, where the fight occurred July 30, there is no doubt that Victorio and at least 100 of his effective force were engaged with the United States troops on the day mentioned, and that they were much more seriously handled than was at first reported. Their present camp is opposite Del Alamo, in the mountains in Mexico, adjoining the river. Col. Vielle, who is moving down the river, has been informed of this. The last reports received from scouts state that the river has risen since the Indians crossed back into Mexico, and it is now only passable with great difficulty, being higher than at any time before this season.

FINDING BURIED MONEY.

A large number of old coins were found by some boys at Mahanoy City, Pa., on the 10th, which calls up the particulars of a murder at that place in 1810. Some of the coins date back 200 years. An old resident of the place gives this version of the story: "In the year 1810, when the country for miles around here was a vast wilderness, and contained only one house, a country inn stood at a point which is now the central part of the town. A Jewish person named Foulhover was in the habit of going on horseback with his wares from Reading to Sunbury. On a particular day he stopped at the inn in question. A hunter from New Jersey, named Bailey, was also stopping at the house. When the peddler alighted, Bailey carried in his saddle-bags for him. While doing this he heard the jingle of money, and, as the bag was heavy, he came to the conclusion that there was considerable gold and silver in it. A desire for this money at once preyed upon his mind, and a murderous spirit seized his heart. He accordingly proceeded up the mountain, and lay in ambush for the approach of the peddler. When Foulhover was passing where he lay concealed, he drew his rifle upon him and shot him through the heart. The horse he rode, strange to say, stood perfectly still, and Bailey approached and rifled the saddle-bags. Taking all the gold and silver therefrom, he carried the bags, with the smaller coin, to the point where the contents were recently found by the boys, and deposited them in the earth. Bailey then went to Reichstorion, the proprietor. Seeing his hands and clothes besprinkled with blood he asked him the cause. He replied that he had shot a deer. He then left the inn and was not heard of for some time. Persons going along the road found the body of the peddler and it was interred by the roadside. A small mound marks the spot to this day, and people from adjoining places never pass the place without referring to the fate the peddler met. Bailey was traced to New Jersey by the authorities and arrested. He was taken to Reading, lodged in jail, and tried for the crime. The circumstantial evidence was strongly against him, and he was found guilty and subsequently hanged. Before his death he made a confession in which he stated where he buried the saddle-bags, but the exact spot could never be found.

THE CAUSE OF STEAMBOAT DISASTERS.

The Assistant U. S. District Attorney has been assisting in the finding of the Grand Jury in the recent steamboat disasters, and on the 10th they brought in a sweeping presentment against owners and inspectors of steamboats. Indictments were found against Austin Jayne and Andrew Craft, United States Inspectors of Vessels, Hulls &c.; John K. Matthews and Alexander Cauldwell, Inspectors of Steam Boilers; Charles P. Smith, Captain; Edgar Weeks, Engineer, and Benjamin C. Kirk, S. L. M. Barlow, Stephen Tabor, James Udall, Edward Morgan, Silas Mott, and Stephen H. Townsend, owners and Directors of the steamboat Seawanhaka, each of whom is charged with manslaughter. Upon motion of District Attorney Fiero, bench warrants were ordered to issue for the arrest of the indicted parties.....A despatch from Oswego, Kansas, says that the supposed Benders had an examination at that place on the 10th, and were discharged.....A Frenchman named Anthony Amadee Bigot, murdered the wife of Victor Renaut at 141 Thompson Street, New York, on the 11th instant. After cutting her throat he drew the razor across his own inflicting probable fatal wounds.....Mr. James H. Baggett, a cotton broker of New York, was drowned by the capsizing of a boat on Lake Mahopac, on the 11th inst.

FOREIGN.

In England agitation over the rejection of the Compensation for Disturbances Bill by the House of Lords still continues. In Ireland several public meetings have been held on the subject, at which very violent language has been used. Agrarian outrages are again becoming common. A couple of land agents have been shot at during the week; a crown solicitor and his two sons were waylaid and shot, one of the sons being severely wounded, while threatening letters have become everyday matters. Meanwhile, the relief organizations have closed operations, although a good deal of distress still prevails, especially in the west of the island where fever attributed to the famine has become epidemic. Fenianism, it is said, is again becoming active throughout the island, chiefly through the agency of Irish-Americans. A masked party in a couple of boats boarded a Swedish vessel at Queenstown and carried off several cases of rifles she had among her cargo. On the whole, the prospect in the "Gem of the Sea" is by no means of an amicable sort....Gladstone is in fair health again.....Lilian Adelaide Neilson, the actress who traveled widely through this country, died in Paris yesterday ....Mr. Arthur Arnold's Parliamentary motion for some modification of the rules regulating the importation of cattle from this country, was rejected by a vote of 194 to 20. The government opposed it.....The old baroness, Burdett-Coutts, despite the remonstances of the Queen and Lord Beaconsfield, is going to marry young Ashmead in a couple of days.

In France the Republican triumph at the late election for Councils-General, has been so overwhelming that it is certain that the Senate will be decidedly republican next year for the first time since the establishment of the present body. Gambetta says that France must be permitted to resume the advanced rank that belongs to her in the world, and regain the provinces violently torn from her. In view of the extreme care with which all allusions to the loss of Alsace and Lorraine have been avoided for years by public officials, this declaration that France expects to recover them is significant—at any rate, of restored faith in the army. In Germany another meeting of the Emperors William and Francis Joseph is the main topic of interest in view of the temporary retirement of Bismarck..... The Spanish paper and cablegrams are chiefly occupied with news and speculations about the approaching birth of an heir to the throne.....Russia denies that she has 45,000 men ready for instant action on the borders of Roumania. Turkey still keeps "putting off" the evil day of settling with her Christian neighbors. Nothing definite has been done regarding the settlement of the "Eastern Question" during the week.

In Afghanistan Ayoob Khan is within three miles of Candahar, in which some 3,500 British troops are entrenched, with ample supplies to stand a siege. There is little chance of the Khan's success should he be foolish or bold enough to attack the place. He is reported to have suffered seriously in the late battle. It is also said that he is secretly in alliance with Abdurrahman Khan, lately proclaimed Ameer at Cabool, while it is strongly suspected that both are more or less puppets moved by Russia. Gen. Stewart is hastening with the forces from Cabool to the relief of Candahar, and other troops are being rapidly pushed to the same place from England, the Cape of Good Hope, and India.

AGRICULTURAL NEWS.

A destructive enemy of the wheat plant has done much damage in Canada especially in the Province of Ontario. It is a small fly or insect that stings the stem, and deposits an egg in the orifice. It seems to rival the Hessian fly, and is particularly injurious to Spring wheat.....At the recent session of the Pennsylvania Legislature a law was passed to encourage tree planting along highways. Elms are to be not less than seventy feet apart; other forest trees not less than fifty feet, and locust trees thirty feet apart. The owner of property on which such trees are planted has his road tax reduced at the rate of $1 for each four trees so planted. The trees must be living one year after planting, and be well protected from animals. Injury to such trees is punishable by fine.....The latest swindle for use in rural districts is the "butter contract" game. A couple of nicely dressed, gentlemanly appearing fellows, drive up to a farmer's house with a fine turnout, and engage all his butter for the season at a big price. The farmer signs a contract to let the merchants have all his butter for a year, and in due course the "contract" comes back in the shape of a note held by a third party, which the farmer has to pay.....About 1,000 farmers held a picnic at the grounds of the Massachusetts Agricultural College, at Amherst, the other day. Aside from hay the principal crops this year are: Oats, 22 acres; corn and rye, 12 acres each; potatoes, 4½ acres; sugar beets, three acres. Lack of funds and unwillingness to incur debt, curtail crops and other operations.....From returns made to the Agricultural Department in April the Commissioner has compiled statistics which show that the average value per acre of cleared lands in Ohio is $47.53, and that these lands are only exceeded in value by those of Massachusetts, New York, and New Jersey, which are respectively $85, $58.48 and $82.42. In the average value per acre of timber lands, Ohio stands second only to New Jersey and Massachusetts, the figures being New Jersey $56.82: Massachusetts, $43.25; Ohio, $41.87. Both descriptions of lands in Ohio show an average increase in value over the preceding year of 08.5 per cent.....Vermont takes the lead in the production of maple sugar, producing from 8,000,000 to 10,000,000 pounds annually. New York comes next, producing one-third less. Ohio comes third, and produces about half as much as New York. The States of Illinois, Indiana, New Hampshire, Michigan and Wisconsin produce annually about 1,000,000 lbs. each. The aggregate product of 1879 is estimated at 17,000 tons. The production of maple sirup annually is stated at 1,000,000 gallons, in which Ohio takes the lead .....Reports from tobacco growers all through the Connecticut valley are that the crop is in unusually fine condition, and a Hartford dealer estimates that, while the acreage is no greater than last year, the yield in the State will be from one-quarter to one-third larger. Cutting is in progress already on some East Hartford farms and in several other places in the valley.....In 1840 there were nearly half a million sheep in Connecticut, a State admirably adapted to growing mutton-sheep. In 1870 there were less than 84,000. At the present time in many towns there is not a single one. The extermination of sheep by dogs, not lack of profit in the business, is the reason why sheep are no longer raised. One butchering firm in New Haven killed in 1878 over 12,000 sheep and lambs, of which not over 100 were raised in Connecticut; most of them came from Canada..... Mr. F. A. Simpson of Pleasant Hill, Cass County, Mo., has just completed a selection from the herds of leading Hereford breeders, consisting of thirty-three cows, one bull and nine calves—all pure bred Herefords. They are to be shipped in the steamer Dominion, which will sail for Quebec on Thursday, whence they will be forwarded to Missouri.

We are now sending Indian corn to England at one cent a pound, and shipping large quantities to Hamburgh and Bremen for distillery purposes. .....Canada is alarmed at the rapid destruction of its hemlock forests, which annually supply 120,000 cords of bark for home consumption and 106,374 cords, valued at $360,259, for export. The Montreal Board of Trade calculate that 1,250,000 trees are cut to supply this demand, and that 15 years of the same destruction will wipe out their extensive hemlock forests. The bark brings as low as 54 a cord, and in the hope of checking the outside demand with a higher price, efforts will be made at the next session of Parliament to induce the government to impose an export duty of $2 per cord on all bark leaving Canada.....Oliver Dalrymple, the bonanza wheat raiser, says that the yield will be 2½ bushels per acre more than ever before. Harvest with him is just now at its hight..... Potato beetles took entire possession of a church at Sandoval, Ill., on a recent Sunday evening. Windows, doors, and seats were swarming with them. Ladies screamed, and the service came to a sudden end.....The Duke of Portland has had a site prepared on one of his English estates for a beaver village for a number of beavers imported from Canada.....The hop-growers of Central New York have just held their annual picnic on the shores of Oneida Lake and calculate that this year's crop will reach 125,000 bales and sell at 30 cents a pound at least. Last year's crop of 110,000 bales sold for 15 cents only half of the average price for the last ten years. New York growers, however, estimate their crop a third below last year's, but the English hop-yards were reported in poor condition. It fairly mirrors what nine out of every ten of the hop growers said to each other, to say that the growers feel that this year, with no back stock in the hands of brewers, they do not intend to give the profits of their crops to speculators, or to sell at low prices. None talked of prices below 30 cents, and not a few were confident that "two pounds for a dollar" would be realized in the market of 1880.....Our correspondent, Prof. J. P. Sheldon, has been specially engaged by the Canadian Government to investigate the advantages of the Dominion as a home for British and other immigants, with a view to inducing a heavy immigration to that section. The Professor is to visit the Red River region of Canada, Manitoba, and all of Upper Canada during his intended tour..... Out in Grundy County, Ill., a small grub like the white grub often found in barn-yards is severely damaging the corn fields. To look at the corn from the road it looks as though it was greatly in need of rain—drying up; but on on pulling up the stalk forty or fifty of these grubs will be found among the roots, and most of the roots destroyed. They seem to be more plentiful on high lands..... California vineyards are creeping up the hillsides. The grape and raisin crops of the State, it is estimated, will exceed those of last year by about 40 per cent... ....Mr. Dunham's fine selection of 97 Percheron horses arrived safely at this port during yesterday week, and were landed on the 11th. Although somewhat at a disadvantage after their long voyage, they made a splendid show, and attracted a world of admiration as they passed through the streets to the stables in which they were temporarily housed.....The crop of corn everywhere will be heavier than for a long time.....One hill in Lincoln County, Miss., yielded fifty-four large-sized potatoes. .....At Manasses, Va., one oat seed produced stalks which yielded more than 1,000 perfect grains.....A fast peach train, direct from the orchards of Delaware and Maryland, runs into Boston early every morning.... ...Within a radius of ten miles of Madison, Ind., there are 250,000 peach trees, from which will be gathered and shipped this season 150,000 bushels of peaches. Felton, Minn., reports the heaviest grain crops since 1880, and an enormous hay crop. The harvesting is under full headway, and harvest hands are scarce at $3 a day.....A stalk of sugar-cane raised on Gen. Edgerton's place, Kasson, Minn., measured nine feet ten inches high and three and three-fourths inches in diameter a foot above the ground..... A Royalton, N. Y., farmer had just loaded his wheat in the harvest field when he knocked the ashes from his pipe. They saved the team, but the wagon and wheat were burned.....The 13-year-old daughter of a Washington Township, Mo., farmer plowed, harrowed, and sowed twenty-four acres of wheat, unassisted, from which 402 bushels of wheat were thrashed.

"New-Fangled Notions"

may not work injury to people when they relate to matters of little consequence, but when entertained as to what we shall take when afflicted with serious disease, they may lead to dear expe-

rience. Don't therefore trifle with diseases of the blood manifested by eruptions, blotches, scrofulous and other swellings and grave symptoms, but take that well tested and efficacious remedy, Dr. Pierce's Golden Medical Discovery—the greatest blood-purifier of the age. If the bowels are very costive use also Dr. Pierce's Pellets (little sugar-coated pills.)

CURES FEVER AND AGUE.

DR. PIERCE, Buffalo, N. Y.:—DEAR SIR—I write this to inform you that my child, one year old, has been permanently cured of the fever and ague in a week's time, by the use of but half a bottle of your Golden Medical Discovery. My wife a long sufferer from liver complaint and biliousness, by the use of the Discovery and Pellets has been entirely relieved. The Discovery has never disappointed us for coughs and colds. Yours truly,

Pleasant Valley, Ill. JAMES STRICKELL.

Purify the blood by cleansing the system of foul humors, and by giving strength to the liver, kidneys and bowels to perform their regular functions. Kidney-Wort will do it.

Eminent physicians are prescribing Kidney-Wort for the worst cases of kidney complaints, constipation and piles.

Write to MRS. LYDIA E. PINKHAM, No. 233 Western Avenue, Lynn, Mass., for pamphlets relative to the curative properties of her VEGETABLE COMPOUND in all female complaints. For sale by all druggists.

For Neuralgia, Pains and Aches in the Back, Kidneys or Limbs,—Hop Bitters.

Premature Loss of the Hair, which is so common now-a-days, may be entirely prevented by the use of BURNETT'S COCOAINE. It has been used in thousands of cases where the hair was coming out in handfuls, and has never failed to arrest its decay and to promote a healthy and vigorous growth. It is at the same time unrivalled as a dressing for the hair. A single application will render it soft and glossy for several days.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Aug 14, 1880.

BEANS AND PEAS.—There has been an unusual good sale for beans: exporters and local buyers have taken stock fast enough to make a strong range of prices for all grades. Black beans may be excepted, out the demand for them is purely special. Green peas are quiet at $1.65@1.70 for Wisconsin. Southern B. E. peas hardly quotable.

Marrow beans, prime, $1.65; other, $1.55@1 62; medium, prime $1.45; other, $1.35@1.42½; pea, $1.45@1.65; white kidney, $1.70@1.85; red kidney, prime, $1.55; other, $1.40@1.50; black (or turtle soup), $2; Cal. Lima, $5.

BEESWAX.—Is at better prices and demand fair; Western and Southern quoted at 25@25½c.

BUTTER.—The market for creamery is weak. Best retailers are turning attention to fine half-tubs, obtaining, they think, better average quality; certain it is there are few long lines of creams are worth the extreme right through. Western creamery is hard to move: exporters have taken a few parcels but have dictated a favorable price; say 22@24c. The bulk of export trade has run in undergrade Western. At one period of the week matters looked as if there would be gradual and steady breaking off in quotations; light receipts, however, afford some rescue, and the market closes fairly firm at about last figures.

Creamery, finest, 23@26c.; good to prime, 28@24c.; fair to good, 24@23c.; sweet cream, best, 21@23c.; fair to prime, 23@24c.; State tubs, 20@23c.; pails and half tubs, choice, 24@23½c.; good to prime, 22@22½c.; poor to good, 15@22c; Welsh tubs, choice, 22c.; other, 19@21c.; Western imitation creamery, 16@22c.; dairy, fresh, best, 20@21c; poor to good, 14@20c.; factory, fine June, 18@19c.; good market grades, 16@17c.; poor to good, 14@16c.

Receipts for week, 31,575 pkgs.; exports for week, exports for week, 10,650 pkgs.

BROOM CORN.—Demand is slack and prices unchanged.

Brush and short broom, choice, per ℔., 7@8c.; do., do., common to good, 5@6½c.; hurl, good to choice, 7@8c.; do., common to fair, 5½@6½c.; red and crooked at 3@4c.

CHEESE.—The buoyancy noted in our last report extended to the dealings of the early part of this week, and sales were made at 12@12½c., but later on shippers became more indifferent and it was impossible to get them to go on except at concessions and prices after yielding slightly, finally settled down to 11½c. closing, however, very irregular and some parties claiming that they are getting the best factories as low as 11½c.

Quotations are: State factory, fancy, at 11½c.; do. good to prime, 10½@11c.; do. fair to good, 10@10½c.; do. half skimmed, 8@9½c.; Wisconsin factory, fine, 11@11½c.; do. good to prime, 10½@10¾c.; do. fair to good, 9½@10¼c.; Ohio factory, fine, 11@11¼c.; do. good to prime, 10@11c.; do. flat, fair to good, 9@10c.; do, poor to fair 8@8¾c.

Receipts for week, 153,281 boxes.
Exports, 75,000 do.
Liverpool cable, 58@59s.
Steam, Liverpool, 45@50s.

COTTON.—Trade is very moderate and prices vary slightly. Latest prices are for August, 11.47@11.48c.; September, 10.95@10.96c.; October, 10.61@10.62c.; November, 10.51@10.52c.; December, 10.51@10.52c.; January, 10.61@10.63c.; February, 10.75@10.77c.; March, 10.89@10.91.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—The market has been more freely supplied with new fruits; the demand has been very fair for blackberries, cherries and raspberries and prices well sustained.

Apples—Evaporated choice, ring cut, 13½c.; evaporated, fair to prime, ring cut, 12@14c. State, 1879, fine cut, 6@7c.; State, 1879, quarters 6@6½c.; Western, 1878, 3½@5c. Peaches—North Carolina, good to prime, 12@14c.; Georgia peeled, fair to prime, 11@13c; Georgia, peeled, poor to fair, 6@10c. Plums—State 1879, black 16@17c. Blackberries—1880, prime 6½@6¾c. Cherries—Southern, 1880, 17½c, Raspberries—1880, prime, 26c.

EGGS.—Receipts for week, 6,700 bbls.; do last week, 8,900. do. There have been but one or two days of activity during the week and as these occurred at the latter part, they have not arrested prices much. Receipts are smaller, but we are in a season when large supplies are not coveted.

N. J. & L. I., 15@16c. ₰ doz.; State and Penn. 14½@15c.; Western and Canadian, fresh 13½c.; off grade lots 12@13c.

FLOUR.—Offerings are liberal of new Winter wheat grades, for which prices are steadily declining. Old Spring wheat stock holds to firm prices.

Latest sales are at $3.40@4.15. for inferior to very fancy superfine State and Western; $4.00@4.25 for ordinary to very good extra State, odd lots and lines; $4.25@4.40 for very good to fancy do.; $4.00@4.25 for ordinary to very good shipping extra Western, and $4.25@4.40 for good to fancy shipping extra do.; inferior to very good white wheat extras, $4.30@4.50; very good to choice do. at $5.50@6.00; (very choice to fancy do. held at higher figures;) red and amber winter wheat, inferior to very choice trade and family, at $4.50@5.00; round hoop Ohio, $4.25@4.75; and trade and family brands of do, at $4.85@6.25; St. Louis at $4.75@5.50 for inferior to good extra; $5.70@6.00 for good to choice (very choice to fancy brands held higher); Minnesota clear, inferior to very choice at $4@6.25; Minnesota "straight," very poor to fancy, at $5.75@7.50, and patent inferior to very fancy at $6.00@8.50; unsound stock at from $2.25@5.00; city mill extra at $5.50@5.65 for very good to choice for the West Indies; do. for England, $4.40@4.50 for poor to very choice spring wheat, and $4.65@5.25 for winter wheat product; do. trade and family extras, $5.75@7.00; do. for South America, $5.60@5.90; No. 2 at $2.25@3.35 for poor to choice.

Receipts for week, flour, bbls. 135,873; corn meal, do. 3,675; wheat, bush. 1,122,500; corn, do. 1,834,400, oats, do. 100,300; rye, do. 18,755; malt, do. 28,300; peas, do. ——; beans, 1,788; rice, pkgs. 716.

Exports for week, flour 87,860 bbls.; corn meal, 6,100 bbls.; wheat, 1,985,400 bush.; corn, 786,200 bush.; oats, 1,080 bush.; peas, 2,270 bush.; beans, 1,376 bush.; rice 1,073 pkgs.

CORN MEAL.—Is selling at $2.50@2.75 for yellow Western and $3.20@3.25 for Brandywine.

FRESH FRUITS.—Apples have again overstocked the market and very few sorts make the extreme. A feature of the season is the exportation of 600 bbls. Summer apples; sweet and sour bough, 50c.@$1; strawberries, 75c.@$1.25; Gravenstien, $1@1 37; Porter, 75c.@$1.25; Ortugo and Nyack pippins, 50c.@$1.25. Peaches ruled irregular in price, especially as as there is no shipping outlet for large supplies on Saturday.

Closing wholesale prices, N. J., not good as yet, 25@75c. ₰ basket; Del., Crawford, prime, $1@1.25; Mixons and Stumps, 50@75c.; common but useful, 30@50c.; Up-river, 50@75c. Pears are bringing good prices with a full supply and poor weather for holding; Bartlett, State, choice, ₰ bbl., $5@5.50; under qual., $2.50@3; Southern Bartletts, $1@1.75 per crate; Sickles, $1@1.75; Clapp's Fav., per bbl., $4.50@5; cooking, $1.75@2. Cal. pears and plums, express from Chicago, $3@4 per case. Plums are slow, as they arrive too early for a family demand; Egg, ₰ bbl., $3.50@4; Green Gage, $4@4 50; Lombard, $2.50@2.75; common green, $3@4; blue, $2@2.50, all State stock. Grapes are in large supply and begin to sell, as prices are becoming attractive; cases of Delaware, 50 lbs, $4.00@5; Marthas, $4@4.50; Concord, $2.00@2.50; Ives and Hartford, $1.75@2; loose grapes, 2@4c. Up-River vineyards will now ship. Whortleberries out of demand; all quoted 37@40c. per half bush.; Nutmeg melons, Hackensack, $1.75@2.50; common Keyport, 50c.@$1.25. Watermelons, good to choice, $15@22 per 100; under grades, $5@12. Hot house Black Hamburgh, grapes, 30@35c.; Sweet Water, 20@30c. The market for peanuts is perfectly silent; prices entirely nominal, Va. hand-picked, 5@5½c.; extra prime, 4½@4¾c.; good to prime, 4@4½c.; common, 3½c.; shelled, 5@5½c.

GRAIN.—Wheat has been active and fluctuating, closing weak under freer supplies. Exports for the week have been 1,680,000 bush.

Latest sales are of No. 1 white at $1.10@1.11; do., August, at $1.09@1.09¾; do., September, at $1.07¾@1.08; do., October; at $1.07¾@1.07¾; No. 2 white at $1.06@1.07; ungraded white at $1.05@1.07; No. 1 red at $1.11½; No. 2 red at $1.07¾@1.08; do. Aug., at $1.07½@1.08½; do., Sept., at $1.07¾@1.08½; do. Oct., at $1.08¾@1.09; do. steamer grade at $1.06½; No. 3 red at $1.06@1.06½; do., steamer grade, at $1.00½@1.00¾; ungraded red at 98c.@$1.12; mixed winter at $1.06@1.06½; No. 2 Milwaukee and Chicago at $1.05@1.07. Rye is quiet at 83@85c. for No. 2 Western. Corn is fairly active and closed strong: shipments for the week have been 980,000 bushels; latest prices are for New York No. 2, at 49@49½c.; do., August, at 49@49¼c.; do., September, at 49½@50¾c.; do. October, at 51@51¾c.; ungraded mixed Western at 47@49¾c.; No. 2 white at 55c.; steamer white at 52c. Oats are active and firm; latest sales are of No. 1 white at 46@47c.; New York No. 2 white at 45@45½c; No. 3 white at 41@42½c.; New York No. 1 at 43c.; New York No. 2 at 43½@43c.; do., August, at 35½c.; do., September, at 34¾; do., October, at 34¼c. bid; No. 3 at 40c.; ungraded white Western at 41@41¾c.; ungraded mixed Western at 40@42c.; No. 2 Chicago at 43c

HAY AND STRAW.—The business has been good and prices well sustained.

Shipping hay quoted at 80@85c.; medium to prime do., 90c.@$1; salt hay at 65@70c.; clover do. at 70@80c. Straw at 90c.@$1 for long rye; 55@65c. for short rye; and 55@60c. for oat.

Exports of hay for week, 1,078 bales.

HOPS.—There is a dull market, scarcely a disposition to buy even small lots, and prices are weak and altogether nominal. Quotations are for

	Cents per ℔.
New Yorks, choice	28 @30
New Yorks, fair to medium	25 @27
Eastern	23 @25
Wisconsin	23 @15
Yearlings	7 @14
Olds, all growths	5 @ 8
Pacific Coast, new	25 @28
Pacific Coast, olds (nominal)	5 @ 8

OIL CAKE.—Westernis quoted at $30 50 ₰ ton.

POULTRY AND GAME.—Dressed chickens are unusually low. Coops are down to 10@12c. for live and shippers of dressed have to be governed more or less by city killers. Fowls have sold well. Turkeys have little inquiry. Young ducks are in fair demand.

Turkeys, small, ice-packed 14@15c.; fair to good, 12@13c.; Phila., dry-picked, 13@14c.; chickens, Phila., large, 16@18c.; small, 14@15c.; State and Western, 12@13c.; Fowls, Phila., dry-picked, 13@14c.; Jersey, 12@13c.; Western, 9@10c., the lower rate for scalded.

Supplies of live are liberal and include a good many poor Western and Southern.

Chickens, Jersey, ₰ lb., 11@12c.; Western 10c.; Southern, 10c.; fowls, New Jersey, 11c.; Western, 10@11c.; Southern, 10c.; roosters, 7@6c.; ducks, near points ₰ pair, 55@75c.; Western 40@50c.; Southern, 40@45c.; geese, near points $1.50@1.75; Western, $1 12@1.25; Southern, $1@$1.12; pigeons, 20@30c.

Woodcock are in fair demand at 87@90c.; English snipe $2. Stuffed Western pigeons, $1.50@1.75. Grass plover, $3, large Yellow legged snipe $2; small 75c.

PROVISIONS.—Hog products have been active and closed much higher, due largely to the speculation here and at the West.

Mess pork closed at $15.70 for early deliveries. Bacon at 8¾c. for long clear and 9c. for short clear. Lard—Western steam at 8c. for spot lots; $ 02½@8.05c. for Oct.; and 7.90c. for Nov. Stearine at 8¾@9c. for choice. Tallow at 6¾@6¾c. for prime.

Receipts for week, beef, 55 pkgs.; pork, 2,200 bbls.; cut meats, 25,700 pkgs.; lard, 14,900 pkgs.

Exports for week, beef, 2,100 pkgs.; pork, 3,675 bbls.; cutmeats 9,857,000 lbs.; lard, 4,122,620 lbs.

SEED.—Clover is quiet; quoted at 7¾@8c. Timothy is slow and nominally $2.75@2.90.

TOBACCO.—Export trade is moderately active and there is a fair home demand. Prices are firm. Quotations are for

LIVE STOCK MARKETS

NEW YORK, Saturday, Aug. 14, 1880.

BEEVES.—Receipts for the week 11,105 head; do. last week 14,331 do. Light receipts had no effect in stimulating a demand; in fact, the attendance of butchers was very small even for a Summer market day. Good to prime steers were a trifle higher than on Wednesday. Cherokees and Texans were mainly sold at 6¾@7¾c., to dress 55 lbs; fair grade, corn-fed Texans 7¾@8c. Native steers ranged at 7¾@10c., 55@57 lbs. dress respectively. A good proportion of the sale sales rated at 8¼@9@9¾c.

COWS AND CALVES.—The ranges that have been current for a number of weeks cover all recent transactions. When $55 is obtained the cow must have valuable points that would make it worth equally as much in the country. Trashy to fair stock $25@32; good $40@50.

SHEEP AND LAMBS.—Receipts for week, 27,783 head; do. last week 35,047 do. Market dull for all at low figures. Sheep 3¾@5c; lambs 3¾@6c.

SWINE.—Receipts for the week, 23,476 head; do last week 25,504 do. Market quoted firm 5¾@5¾c.; city dressed heavy to pigs 6¾@6¾c.

VEAL CALVES.—Prime veals have had a fair sale, but there has been an abundance of buttermilk and grass calves that have kept general prices weak.

Live calves, N. J. and Rocks Co., choice, 5@6¼c.; do. prime, 5¾@5¾c.; State prime to choice, 5¾@6c.; poor to good, 3½@5¼c.; heavy 5@6c.; buttermilk, 1¾@2¼c.; grass, 1½@1¾c.

The Literary Revolution.

What Is It? It is a method of placing literature, of the best class only, within reach of every one. Books are reduced in price to but a fraction of their cost heretofore. July is supposed to be the Dull Month of the year. Booksellers close shop and go fishing, because book buyers are supposed to have done likewise. The Literary Revolution has made the past July one of the busiest months of the year for dealers handling our books, because the people believe in it. Letters have come to us like a flood; telegrams from dealers have come like the day before Christmas, calling for more books, and quickly. Our bindery is now taxed for the production of 4000 volumes a day, not counting pamphlets, and we are taking immediate steps to double its capacity, to keep up with orders. All Revolutions seek volunteers, and it has been the policy of The Literary Revolution from the start to give special reward to early volunteers in its support. It offers special terms to all whose orders, with cash, are received during August, as follows;

July Victories.

August Opportunities.

Chambers's Encyclopædia.

A verbatim reprint of the last English edition, in 15 beautiful volumes, clear nonpareil type, handsomely bound in cloth for $7.50; the same printed on finer, heavier paper, wide margins, and bound in half Russia, gilt top, price $15.00. The first eleven volumes are ready for delivery. Volume 12 will be ready Aug. 15. The remaining volumes will be completed by October.

AN AMAZING OFFER.

To all whose orders and money are received during the month of August, we will supply the 15 volumes, in cloth, for $6.50, and in half Russia, gilt top, for $13.00. The volumes issued will be sent at once by express, and the remaining volumes when completed.

A specimen volume in cloth will be sent, postpaid, for 50 cents, or in half Russia, gilt top, for $1.00, and may be returned at once, if not satisfactory.

The "CHAMBERS'S ENCYCLOPÆDIA" comprises the first 15 volumes of our "Library of Universal Knowledge," and the remaining volumes, complete in themselves, will be sold separately when published.

Curiosities. To illustrate and demonstrate the superior literary and typographical character of our books, notwithstanding prices are low beyond comparison with the cheapest books ever before published, we publish twelve books in pamphlet form and send postpaid as follows. As mere curiosities they are worth obtaining by every one, even if they were not intrinsically valuable. As might be expected, they are selling by the million. All the following are unabridged, and none of them are in type smaller than brevier. Nearly all of them have heretofore been published by other houses at from $1.00 to $1.25 each. Macaulay's "Life of Frederick the Great," Carlyle's "Life of Robert Burns," Thos. Hughes' "Manliness of Christ," John Stuart Mills' "Chapters on Socialism," Mary Queen of Scot's Life, by Lamartine; "Leaves from the Diary of an Old Lawyer"—short, thrilling, laughable, pathetic stories—each complete, price three cents. "The Light of Asia," by Edwin Arnold; "Baron Munchausen's Travels and Surprising Adventures;" "Vicar of Wakefield," by Oliver Goldsmith; "Stories and Ballads for Young Folk," illustrated, by Ellen Tracy Alden, each five cents. Closing the list is Bunyan's "Pilgrim's Progress," price six cents; and "Private Theatricals" (humorous stories, not plays), by author of "Sparrowgrass Papers," price, two cents.

Books, 3 Cents.

Books, 5 Cents.

6 Cents—2 Cents.

Notwithstanding the amazingly low prices of these pamphlets, they pay us a good profit. The Literary Revolution does not humbug people by pretense of philanthropy. People who have sense enough to appreciate good books are generally honest enough to be willing to pay for them, and they can afford to pay when prices are low as the Revolution makes them. In this connection it is proper to mention a few facts. Some millionaire publishers have been adding to our fame and multiplying our friends by calling us pirates. They pay (when they please!) foreign authors a copyright. One of them charged you $1.00 for Hughes' "Manliness of Christ"—we sell it to you for 3 cents. How much of the 97 cents difference did Hughes get, do you think? Another published Geikie's "Life of Christ" for $3.00—our price is 50 cents. How much did Dr. Geikie get of the $2.50 difference? His letter to us says "nothing." Scribner's Monthly attacked us recently, calling us Cheap John Publishers. The same electrotypers and printers that do their work are working also for us, and you want no books more beautiful than are some of ours. The great Methodist Book Concern has refused us space even in the advertising columns of its several Christian Advocates. Why? Our books are so cheap they contract with and injure the sale of theirs. We reduced Smith's "Bible Dictionary" from $3.00 to 50 cents; Kitto's "Cyclopedia of Biblical Literature" from $10.00 to $2.00; and Young's "Analytical Concordance to the Bible," "the Webster Unabridged" of religious literature, the greatest work of the kind which the century has produced, from $15.00 to $2.00. The people may pronounce the verdict who is guilty of wrong-doing—we, or the millionaire publishers

Stop Thief!

Who Is He?

General Grant. General Grant once said that the best way to get rid of a bad law is to enforce it. If the want of an international copyright is a wrong to foreign authors, American publishers are to blame that there is none, and could influence the passing of such a law quickly if they chose to do so. We believe that the author of a book is as much entitled to absolute property in it the world over as is the author of any other product of the hand or brain. We vote for a law to give him such ownership, and The Literary Revolution more than all other influences is forcing the consent of millionaire publishers to the passing of such a law. But there is plenty of humbug in the talk of high prices being the necessary result of copyright. Five cents copyright on a book would give an author $5,000 on a book that would sell 100,000 copies; and a book intended for the masses that will not sell 100,000 if put at a reasonable price does not deserve to be published at all. And the really standard books that the masses want ought to sell and will sell a million copies each easily when The Literary Revolution has achieved its final victories and made the masses readers of good books. At 1 a million books, paying copyright of even one cent each would give an author $10,000, which is more than ten times what the average successful author now gets. But Bunyan, Goldsmith, Milton and Virgil are no longer wanting copyright, and Macaulay, Carlyle, Gibbon, De Foe, Plutarch and Æsop ceased to receive it long before the days of The Literary Revolution. We do pay five to fifteen cents copyright on several of our books to American authors who have the right to it, and we are paying regular salaries, many thousand dollars a year, to writers in our service.

Standard Books.

Library of Universal Knowledge, 21 vols., $10.50.
Milman's Gibbon's Rome, 3 vols., $2.50.

Reading for the Young.

THE OWL.

THE great white owl looks wondrous wise
In his throne on the old oak tree,
With his long hooked nose and his glassy eyes,
The old solemnity!

But, ah! my children, 'tis all pretense,
He's dozing all the while;
That judge-like air of wit and sense,
Is worn but to beguile.

Then look at the man behind the wig,
And trust not outward seeming:
For the pompous owl that looks so big,
Is a dunce who is idly dreaming.

Buckners Station, Ky. LAURA S. HAGNER.

THE WHIP-POOR-WILL.

"Whip-poor-will!"
"Whip-poor-will!"
Why dost thou
Whip poor Will?

I suppose most of the little readers of the RURAL out among the fields and woodlands have heard the low, sad voice of the whip-poor-will, but many of you have never seen the quiet little fellow as he flits about in the early dusk, and from hillside and orchard bough calls softly "whip-poor-will, whip-poor-will," and heard the mammas say to the crying little folks, "Hark, the birdies are scolding the naughty little babies!"

The ornithologist, Wilson, has named him Caprimulgus vociferus. Is not that a pretty long name for so small a bird?

He wears a modest little coat, a sort of mixture of black, brown and rust color, in fine streaks and sprinkles. One long stripe of black marks the grey of the top of the head, while the sides of the head are of a soft-brick color, with a semi-circle of white around the throat. Around the bird-face is a row of bristles, whiskers we call them for fun, longer than the bill, while the beak is a mottled white and brown. A veritable little Quaker, with never a trill or quaver, never a frolicsome note in all his little song.

The whip-poor-will fancies a home in the lowland near a stream, and for a nest he makes a slight excavation upon the surface of the dry ground somewhere in cool, woody places, usually close by some sheltering rock or hidden by a mossy log, and there, about the 1st of June, as far north as 43 deg. north latitude, you may discover two blueish-white eggs, thickly mottled with dark olive.

By and by, when the little ones are large enough to run, they dart in and out like tiny brown chickens or partridges, taking care of themselves as chickens do, and at the first approach of danger hiding themselves under any leaf or twig, and are very hard to discover, because of their quiet color.

There are many people who do not like to hear the whip-poor-will's call, and think he sings only of sorrow, but the little voice, though sad, sounds almost human, and we number among our list of little feathered friends the whip-poor-will.

MAUDE MEREDITH.

HINTS TO THE YOUNG FOLKS.

UNCLE MARK.

AN exact knowledge of the nature and habits of insects and animals, of the growth and nature of plants and flowers, is one of the most desirable branches of knowledge, not only to the young people of the country, but of the cities.

The young of the cities have less opportunity for the observation and study of objects of natural history, but from being removed from them they seem more alive to that study. In the cities the young have the parks and gardens, but have less opportunity to study and handle the objects, for there are careful warnings not to pick any leaf or flowers, and also to "Keep off the grass."

In the country there are no such restrictions, and we can conceive of no more interesting pastime than the strolls in the pastures, by the roadside or in the groves in pursuit of, or in the examination of such particular objects of natural history as may be determined upon.

The great numbers of wild flowers, many of them often considered by the farmer as weeds and pests, are some of them of great interest and beauty. Who will give names and descriptions of those found in their localities? Who has ever caught and described a katy-did? Who of our young people have carefully studied the habits of the birds in their localities? Be sure to examine closely and carefully, and be exact in descriptions.

A PET WOODCOCK.

CHAT.

MR. JOHN MORRIS, of Jefferson Market in New York city, has a tame woodcock which is quite a natural curiosity in his way.

The woodcock, whose name is Dick, was caught in a store in the city to where he had by some unaccountable means wandered from his native fields, about a month ago. His owner provided Dick with an airy cage and some dry weeds for a nest, and a box of moist earth with worms mixed in the dirt, and has succeeded in making him quite tame.

The box of earth is some six inches by ten, and Mr. Morris mixes in it nearly a pint of worms a day, and while doing so Dick pushes against his hands, crying quite earnestly because he cannot get at them direct.

When the worms are covered in the dirt and some moss placed over them, Dick is allowed to dig for them, which he does very industriously, thrusting his bill through the moss, catches a worm and brings it to the surface, bites it and then swallows it.

Dick evidently thinks well of his captivity, for he amuses himself rocking the box and surprising any careless worm which shows itself with a comical expression of satisfaction.

Mr. Morris proposes to give Dick a large, airy cage and a good, solid box to play and dig in.

LETTERS FROM THE COUSINS.

The Brown Thrush.

UNCLE MARK: I would like to ask you a few questions in regard to the name of two kinds of birds. One is a bird about as large as a robin, and yellowish brown above, and white and brown speeks beneath. It has a rather short tail and flies slowly like a young bird just beginning to fly with quick vibrations of the wings. It builds its nest on the low limb of a tree, of grass leaves, &c., nest about like a robin. The eggs are blue (light) about as bulky as a robin's egg, but more rounding and the large end slightly flattened. The other bird is a trifle smaller than the common "Phœbe," of the same color, it has a crest on the back of its head which points backward. The beak is black and around the upper part of its neck it is of a reddish hue. It is lighter below than above and has a medium-sized tail. It has, I think, no song but occasionally a chirp. The markings of the male are a little brighter than that of the female. The nest is built of wool and twigs on a limb about ten feet high, and is as large as a cocoanut; the eggs are five in number, and quite long and white, with black speeks both outside and just under the shell. Please print the answer in the RURAL or write me, a description of the Brown Thrasher and its egg. J. L. S.

Rhinebeck, N. Y.

[The first bird mentioned by you, corresponds to the Wood Thrush, (Turdus Mustelinus); the nest and eggs pretty accurately described; excepting that the color would rather be termed deep blue, with a slight greenish tinge. The second mentioned, resembles the Wood Pawee (Contopus virens) it has no song, but frequently calls pee-we, in a low plaintive voice. The nest, as you describe, is not as it is generally found of this bird, moss and lichens usually form part of the outside materials; but as this family of fly-catchers is a numerous one, it will be worth studying further.

The Brown Thrasher, (Harporhynchus rufus) is one of the best, if not the best song bird of this continent; few birds of the old world equals his melodious voice, which is soft, loud and in some individuals very varied, both in compass and pitch; in his song he is quite unlike the Wood Thrush, which has a set song with all the species.

The Brown Thrush (or thrasher, as sometimes called) arrives in the neighborhood of New York in the early or middle part of April. He is first seen, or heard, scratching over the dead leaves of a wood in search of food; next he is seen on the top of a tree or high bush, pouring out his unrivalled notes, which justly claim for him the title of nightingale of North America. Not being an imitator, as the mocking bird, he gives no discordant sounds; all his music is of a rich character. He is not shy, but will come very close to dwellings to feed or sing; but in building his nest he retires to a secluded spot, builds it low in a bush or on the ground, often near low ground or the edge of a wood. The nest is strongly but not very evenly built of dry grass, roots or twigs, lined with soft grass.

This bird, being very docile and confiding, his color can be often seen distinctly; back reddish brown, breast and under part whitish, with rows of brown spots on breast; his bill is long and a little hooked at the point; his crown flat; tail long, color brown. When singing, his head is slightly raised, tail hangs almost perpendicular; his whole being appears to be excited in the earnestness of his performance. Its eggs are rather over an inch in length, four or five in number, whitish, sometimes inclined to greenish ground color, with spots covering much of the ground color, of a reddish brown.

He leaves very early, for a bird that arrives so early in Spring from the South as he does, commencing his Southern migration in September before the foliage is falling, which protects him from the gunner; being so tame, and larger than a Robin, he would be a tempting object to the boys who show no mercy to the poor birds. He does not Winter so far South as many of our birds; lives mainly on insects, doing much good in their destruction. He will take a few berries from the garden, but in general he is quite modest in his sphere, considering the good he has done towards raising them, by destroying the insects, rendering us delightful and charming vocal performances during his rests from such labor. U. M.]

DEAR UNCLE MARK.—It has been a long time since I was admitted as a member of the Club, but I have never reported, so I will try now. I received the seeds and thank you very much for them. I sowed the China Pink seed in a box, in March, and transplanted them to the garden when large enough. They grew nicely, and are in blossom now and are very large and double. I sowed the Phlox and Mignonette in the garden. The Phlox has grown nicely. It is in blossom now and is very pretty, while the mignonette seems as if it would smother itself growing so fast. I had six seeds of Okra, five of them came up and have done well, some of the pods are six or seven inches long. We had some for dinner one day, but did not like it very well. We have had a great deal of fun at "Gumbo's" expense. It seems to me that it should not be called "dwarf" because it has grown so fast, and each plant is so large.

I had enough of the muskmelon seed for four hills. I put some well-rotted manure from the pig-pen in each hill, but two hills have not grown very well though I don't know why. The melons did surprise me, they grew so fast. I counted six large ones to-day, besides several smaller ones. The Cuthbert raspberries are growing nicely. They have had quite a number of berries on.

I planted the Iris, Aquilegia and Pentstemon seed in boxes. A good many of the Iris seeds grow and I transplanted them to the garden. They are about four or five inches high now. Only three or four Pentstomons came up and four Aquilegias. Only one seed of hibiscus came up, and it does not grow very well, can it be kept through the winter? The Magnolias have not germinated at all. One seed of the Ipomaea is growing, and the golden mangels are doing well.

I have a good many flowers in the garden, though I have not had much time to attend to them this Summer. I have a good many gladioli, but they are all nearly alike; some of the spikes were five feet four inches high, but the wind blew them down last week.

I am raising gladiolus bulbs from seed this Summer, but they do not grow very well. I have two seedling geraniums which have leaves that are almost white, with very little green in them. The seed was from a scarlet geranium, and they are in the same bed with them. Why should they be white?

We sent for some strawberry plants last Spring, Miner's Prolific, Charles Downing, and Sharpless. They are all doing well. We have had plenty of rain, and crops are very good.

I wish I could send you a bunch of flowers from my garden. I am studying botany this Summer and like it first-rate. I have Gray's First Lessons and Field Book.

Can you tell me how to keep snapdragon plants through the winter? I have tried a good many times, but never succeeded.

I am afraid this letter is too long, if it is, please say so, and I will try to do better next time.

Ever yours, PUSSY WILLOW.

Monticello, Ia.

[The root of the Hibiscus is hardy and perennial, but, if the herbaceous species, will die down and must have its rest. Other species may be lifted and potted. The snapdragon may be lifted, cut down and potted for indoor plants during the Winter. Your geranium may be from a cross with some other variety, now showing itself, but we cannot account for these variations. Some consider it a disease.—U. M.]

DEAR UNCLE MARK: I thought I would write to you and tell you how my flowers are prospering. My Sweet Mignonette is in bloom and has been for the past two or three weeks. I guess every seed of it grew. The Portulaca did not come up at all; but the Phlox came up and are now in bloom. The Double Chinese Pinks are not very good. Uncle Mark, is there such a thing as getting the soil too rich? If there is, I believe I got too rich soil for my Pinks. I got it at the woods. I guess I've told you about that trip to the woods I do not think I will try another very soon. My muskmelons, I came near forgetting. Only five stalks came up, out of the twelve seeds planted but what did grow are very fine. There are melons on them that are half grown. I have'nt many plants as yet, but have some hopes of getting more soon. I have a large Wax-plant that is in bloom and two kinds of Geraniums. They are the nicest plants I have. Uncle Mark if you ever come to Stryker we will be glad to have you call on us. MARTIN.

Stryker, Ohio.

P. S. Bring some of our nieces and nephews along with you.

[It is not usual to get the soil too rich. Leaf mold is a good kind of soil, but usually it is not rich enough to grow the healthiest flowers.

U. M.

UNCLE MARK:—Some time has passed by since I wrote you last, but I have not forgotten you, and when I see the handsome flowers in blossom from the seeds you sent they remind me of my duty to write again, and thank you for them. Most all of the seeds came up, both of the flower and vegetable seeds. The okra, phlox, magnolia, iris and grape seeds have not come up, but have been watched with great care. My garden is looking very finely—flowers in abundance and weeds a scarce article. My pansy bed is a beauty indeed; for I have a great variety. My house plants, look well, too, healthy and strong. I have a large begonia that came from a single leaf. I started it in water and when rooted put it in earth, and now it has 20 leaves. I must tell you about a large Normandy horse, four years old, that father has. He had him weighed a few days since and his weight was 1,600 pounds. He broke through the scales when driven on to them, and it frightened him almost to death, but he had no serious injuries, father says. No more for this time, else I will realize the result. Your niece, ALICE.

DEAR RURAL COUSINS:—It is now Summer, and the country is all activity. Although exceedingly warm, the harvesters are busy and of good cheer, as the harvest, it is said, never was better. A good harvest and peace is all a nation can wish for. But in prosperity we must not forget the Lord's harvest, nor should we ever fail to ask for the help which our loving Saviour offers, that we may have strength to do our duty in the field or life, and that we may be one in the harvest of the Lord. Fearing I have intruded on the good nature of ye editors, I will close by stating that Ivy would be pleased very much to get a letter from the Two Sisters, Lizzie B. and O. M., even though ever so little. Please excuse your loving cousin, IVY.

Libertyville, Ulster Co., N. Y.

DEAR UNCLE MARK:—I am ten years old, and I go to school. I have a mile to go. My grandpa takes the RURAL, and I like to read the letters from the cousins very much, and would like to become one of them. I am very fond of flowers, of which we have quite a number. Some of the seeds from the RURAL office are growing nicely. I like to go out in the fields and woods gathering wild flowers and listen to the singing of the birds, and in the Fall we have a nice time gathering nuts. I have been watering my flowers for six weeks, and I am almost discouraged. I have been looking for rain, but it does not come. IDA.

Mountain View, N. Y.

Sabbath Reading.

IN HARVEST DAY.

THRO' Farmer Gale's wide fields I passed
Just yester eve;
My week of holiday was spent,
And idly on the stile I leant,
Taking my leave

Of all the fair and smiling plain,
Wood, vale and hill,
And all the homely household band,
(The warm grasp of each kindly hand
Bides with me still);

And I was sad. The stricken grain
Around me lay;
I could but think of silent glade—
Of buds and blossoms lowly laid
The harvest day.

"And this is all!" I sadly said,
"These withered leaves—
This gathered grain! Spring's hours of bliss
And Summer's glory turn to this—
Some yellow sheaves!"

Then Farmer Gale—that good old man,
So simply wise—
Who overheard, and quickly turned,
Said, while a spark of anger burned
In his gray eyes:

"Lad, thou art town-bred, knowing naught
Whereof thou pratest!
For, be the flower as fair as May,
The fruit it yields in harvest day
Is still the greatest!

"And thou—thy spring shall quickly pass
Fast falls the leaves
From life's frail tree. In harvest day
See that before thy Lord thou lay
Some yellow sheaves."

He went his way; I mine; and now
I hear the flow
Of busy life in crowded street—
Of eager voices, hurrying feet,
To come and go.

Yet e'en while flashing factory looms
My hands engage,
I see that far-off upland plain—
Its long, low rows of gathered grain,
Its rustic sage,

And hear them say: "Let pleasures fair,
And passions vain,
And youthful follies, fade and die;
But all good deeds, pure thoughts and high,
Like golden grain,

"Be gathered still." Blest harvest store,
That only grows
In hearts besprinkled with the blood
That evermore—a sacred flood—
From Calvary flows!

Lord, when Thou callest, when this world
My spirit leaves,
Then to Thy feet, oh, let me come,
Bringing, in joyful harvest-home,
Some yellow sheaves!

—Sunday Magazine.

THE NEW LIFE.

VERY impressive is it, in reading the story of our Lord's last words with his disciples, to notice how earnestly and repeatedly He strove to impress upon them the "whither" of his going. The mere fact absorbed them; He was seeking to teach them the meaning and purpose and results of the fact. In those last chapters of St. John we have our Lord's own interpretation of his ascension: "I go to my Father." This takes away what would otherwise have been the irreparable loss of His withdrawal. He has not, then, passed away into an unknown realm, distinct from human interests. Between Him and these whom His love had bound so closely to Himself, there is no void of strange, unimaginable existence. "I go to my Father. The grave will not hold Me; stand not gazing down into its dark depths. I go to my Father. The abysses of space will not receive me into their far-off vagueness. Think not that beyond the midnight stars I dwell. But let this be your consciousness: with the Father—your Father, as well as Mine—I live; therefore how close to you. With God—my God and your God—therefore, through me you will draw near to Him." On the Resurrection-morning, the assurance was repeated. The first message uttered to the disciples from his glorified lips was, "I ascend unto my Father."

We may think, first, of the aspect of our Lords ascension in relation to Himself. He bids us do so, as he bade those twelve, deep as is the mystery of ineffable joy unto which his words lead. For it is the joy of the eternal Son—a joy inconceivable by man. Yet has He Himself drawn aside the veil that hides it. Unspeakably tender is His appeal: "If ye loved me, ye would rejoice, because I go unto the Father: for my Father is greater than I." You would rejoice in my joy, even while believing it were your loss.

MAKE A BEGINNING.—Remember in all things that, if you do not begin, you will never come to an end. The first weed pulled up in the garden, the first seed in the ground, the first shilling put in the savings bank, and the first mile traveled on a journey, are all important things; they make a beginning, and thereby a hope, a promise, a pledge, an assurance, that you are in earnest in what you have undertaken. How many a poor, idle hesitating outcast is now creeping and crawling on his way through the world who might have held up his head and prospered, if, instead of putting off his resolutions of industry and amendment, he had only made a beginning.

WHEN we fight more against ourselves and less against God, we shall cease fighting against one another.

CHRIST is not valued at all, unless he is valued above all.—St. Augustine.

PERSONAL ITEMS.

Joseph Molody, of Independence, Mo., was murdered by Lewis Hiltz, and Hiltz was acquitted on the ground of insanity; but he was recently struck dead by sunstroke, on the same day of the month, at the same hour of the day, and on the very spot where he committed the deed.

Jack Ince had just fitted up his saloon at Arkana, Texas, with a black-walnut bar. Tom Daly a desperado, took a drink at the new counter and began to carve his initials with a bowie knife on its polished surface. Ince protested without avail, and then commanded Daly to stop. "I'm going to cut this bar or you, I don't care which," was the retort. "You won't do either," said Ince, and shot the bully dead.

It is feared that the death of John G. Saxe's wife will have a fatal effect on the poet. He has been bedridden for some time, and was devotedly attached to her, having, in several of his works, drawn his best woman, both as to loveliness of person and beauty of moral character, so plainly after his wife that friends always recognized the portrait. Miss Saxe, the only living daughter, is also an invalid, and could not attend her mother's funeral.

Drowsiness, biliousness pains and aches, and ague, Hop Bitters always cures.

Educational.

VASSAR COLLEGE,
POUGHKEEPSIE, N. Y.,
For the Liberal Education of Women.
Examinations for entrance Sept. 15. Catalogues sent on application to W. L. DEAN, Registrar.

ALBANY AGRICULTURAL WORKS,
O. H. P. CORNELL, Proprietor. ALBANY, N. Y.

Humorous.

THE individual who saw a mouse fighting with a piece of Limburger cheese readily realized that the battle is not always to the strong.

"I HAVE a love-letter," said the servant-girl to her mistress. "Will ye rade it to me? And here is some cotton wud ye stuff in yer ears whoile ye rade it?"

THE papers are making a great ado over the discovery of a mica bed. Mrs. Malony sends us word that she discovers a Mike abed every morning when the boy ought to be up splitting wood.

YOU may have seen a young man on one side of a gate and a maiden on the other. Why they talk so long is because there is a great deal to be said on both sides.

A YOUNG man sent twenty-five cents to a New York firm for the purpose of learning "how to get along without a blotter in writing," and received this reply, "Write with a lead pencil."—Rochester Democrat.

A SHREWD rascal advertises a machine that will "add up a column of figures a foot long" in six seconds. He sends a piece of chalk with directions to use it on a barn door or other surface big enough to hold figures a foot long.

A YOUNG German was once pressing his suit, and in the midst of his ardor questioned the object of his choice as to her possible financial future. "I have heard" he said "that your good father owns two large estates in Silesia." "Yes," was the naive reply, "and he owns two more in Pommerania." The suitor hesitated a moment as though to catch his breath, and then falling on his knees and looking the young lady imploringly in the face cried out, "and can you my darling, doubt my affection under such circumstances?"

TAKING THE LAW IN ONE'S OWN HANDS.

Fair but considerate customer.—"Pray sit down. You look so tired. I've been riding all the afternoon in a carriage, and don't require a chair."

A Conquerable Malady.

In spite of all assertions to the contrary, dyspepsia even in its worst and chronic form is a disease which can be conquered. Obstinate as it is, it will ultimately yield to the invigorative and alterative actions of Hostetter's Stomach Bitters. That superlatively pure and efficacious specific possesses a reputation fully warranted by the effects which it produces, which are not transient and fleeting, but permanent and thorough. All that is required to render a cure complete is persistence in the use of this standard medicine, which is infinitely to be preferred to the numerous pseudotonics which merely stimulate appetite without strengthening or regulating the organs of digestion in any marked degree. Besides its stomachic properties, Hostetter's Bitters posseses antifebrile virtues which constitute it a valuable remedy in malaria, and is a superb blood depurent and aperient.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XXXIX. No. 35. WHOLE No. 1596. | NEW YORK, AUG. 28, 1880. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Biographical.

M. B. BATEHAM.

M. B. BATEHAM died, after a lingering illness, at his home in Painesville, Ohio, August 5th, 1880. Long, quite intimately associated together for the advancement of agriculture in our adopted State, the elder is now left to lament the departure of his younger yoke-fellow.

Born among the fruitful gardens of smiling Kent, England, on September 13, 1813, with garden associations and surroundings, it was but natural that when his father migrated to the valley of the Genesee in 1825, and established a market garden at Rochester, New York, the younger Bateham, then 12 years of age, should become imbued with a taste for horticulture that has been the guiding impulse of his life-work. His frequent visits to Rochester in later years, since it has become so famous a horticultural center, must have been very gratifying to our friend, who would there see the abundant fruitage of the good seed he himself had helped to sow in the earlier half of this century.

From the garden the transition was easy and natural to the seed-store, and so we find him established as a seedsman in 1833. His qualifications as a writer were soon called into requisition, and for five years he was editor of the old Genesee Farmer, for a long time the leading agricultural paper, even while the fertile valley was recognized as the Great West, a term which has been widely separated from the Genesee in these later years by the westward march of empire.

Mr. Batcham's tastes naturally brought him into contact with such men as Ellwanger & Barry, and he spent some time in their extensive nurseries, which afforded him a fine opportunity of becoming familiarly acquainted with fruits and encouraged his love for pomology. After an extensive Western tour, chiefly on horseback, and partly undertaken in pursuit of health, Mr. Bateham settled in Columbus in 1845, and has ever since been a citizen of Ohio. There, in the first year of his residence, he established the Ohio Cultivator, one of the first agricultural papers printed in the State. In it he found a good medium for imparting much valuable information, and a means of communication with others interested in rural affairs. His articles on insects and grasses were among the first papers upon those topics that were spread before the farmers of Ohio. In its pages he called upon the fruit-growers and nurserymen to assemble in convention and compare notes and fruits, and from this beginning in 1847 has grown up the State Horticultural Society of to-day—a fitting monument to the memory of its originator. From its early organization Mr. Bateham has been its untiring secretary, always declining proffers of what some might consider the higher post of honor as presiding officer. To DO was his choice, and so he preferred to wield the pen to the gavel. Indeed it is the mightier implement of the two, and in his hands it was fully and faithfully employed in the diffusion of valuable information among his fellow-men.

In 1846 the Ohio State Board of Agriculture was organized, and at the first annual meeting, held December 9, 1846, Mr. Bateham was one of those duly elected to serve as a member. At this meeting we find him advocating and urging the establishment of a department of agriculture by the general government at Washington, D. C.

At the annual meeting, held December 6, 1848, our friend, then secretary, was again elected for two years and again chosen Secretary of the Board.

In 1855 the Ohio Cultivator was sold and became the Ohio Farmer. This relieved Mr. Bateham from a heavy burden, and left him free to pursue his horticultural bent. The little nursery which had already been the means of disseminating quantities of choice fruits and plants was largely increased in size and usefulness by the establishment of the Columbus Nurseries, with which Mr. Bateham continued to be connected until he sold his interest in 1864, when he removed to the pleasant little city of Painesville, where he established a happy home and fruit garden. Before leaving Columbus he had planted very extensive orchards, the first venture of the kind in the State, embracing many thousands of fruit trees of different sorts.

It has been especially as a writer on horticultural and agricultural topics that Mr. Bateham has left his mark in Ohio, and this will be more and more fully realized as the years roll by. At his funeral, Mr. Chamberlain, Secretary of the Board of Agriculture, truly said:—"Not an orchard or a grain-field in Ohio but has felt the influence of his labors for the improvement in varieties cultivated, and for improvement in the modes of culture."

As Secretary of the Ohio Horticultural Society, which was like his own offspring, he was a most untiring officer, ever watchful of its interests, and ever willing, as a member of the *ad-interim* committee, to visit other associations of like character in our own and distant States. Whatever he learnt from such visits—from consultation with others as well as from personal observation—he shared at once with the public at large by means of his ready pen and the liberal space always accorded his articles in the agricultural press. So

M. B. BATEHAM.—Fig. 271.

ardent was his desire of benefiting others by his study that during the sickness which has just terminated fatally several contributions from him were published in the RURAL and other papers.

In the family, in the church and in the community about him, our friend always endeavored to discharge every duty faithfully, and he leaves behind him a record of love, devotion and uprightness that is entirely praiseworthy.

His labors for others have now closed; he has gone from the cares of his earthly pilgrimage to the regions of bliss, promised and prepared, as we are assured by our Savior, for those that love and serve Him. May our end be like his, peaceful and happy! W.

Farm Economy.

A SCIENTIFIC VIEW OF COMPOSTS.

PROFESSOR F. H. STORER.

ALL that has been said of dung and urine as the ferment, and of peat or sods as the "body" in compost making will apply as well to a great variety of other organic matters. Fish, flesh, blood, offal, guano, night-soil, the dung of birds all act promptly and powerfully as ferments; while straw, leaves, twigs and bushes mown in pastures, weeds, potato-vines, loam, pond mud, ditch scrapings and a variety of other matters are readily fermentable. Fish, flesh, blood and the like are really more powerful ferments than dung. There is, however, one objection to these substances, which applies more particularly to blood, viz.: that the compost resulting from its use has an extremely offensive odor which, while it annoys the workmen not a little, adds nothing to the fertilizing power of the material. Weeds have the merit of containing very considerable quantities of potash, phosphoric acid and lime, as well as nitrogen; and they would be particularly good for compost making were it not for the seeds they carry. The common notion that weed seeds are destroyed in the process of composting with dung is practically an error, though based on conceptions which are in some part true. But this point belongs properly to another place in the discussion.

Even oil-cake will serve very well to excite the fermentation of compost. To this end cotton seed has been largely used in our Southern States, as rape-cake has been to a certain extent in Europe. Manifestly those kinds of oil-cake which are unfit for fodder, such as the cake from the castor-oil bean and the physic nut, may be appropriately composted. An interesting case of the use of rape-cake is reported by a Swedish chemist. A law of the land forbids the selling or removing of straw from certain estates belonging to the crown, although more straw is habitually produced on these estates than can be used as fodder and litter. In order to decompose the remainder quickly an experiment was tried, as follows: the straw was thrown into heaps six or eight feet high and was then wet with water in which pulverized rape-cake had been soaked and stirred. The moistened straw was covered with a layer of earth four or five inches thick and left to ferment for a month. It was then forked over and again moistened. After the second fermentation, the compost was ready to be hauled out and applied to the land. One cwt. of rape-cake was used for every ten loads of straw, and two months and a half were found to be sufficient for the whole process.

Besides composts prepared with dung, or some other organic substance used as the ferment, there is another very important class of composts which are made with alkalies, such as wood-ashes, potashes, lime, soda-ash, or mixtures of lime and salt. The alkali not only disorganizes the peat and brings about a first fermentation, similar to that induced by dung, but in the case of lime, at least, it doubtless plays an important part in promoting the subsequent nitric fermentation, both in the heaps and in the field. The alkalies have one special advantage in compost making in that they can corrode and disintegrate many rough and intractable organic matters and reduce them to a condition in which they are fit to undergo decay. Hence it happens that alkali-composts are fitly prepared with crude peat, as it comes from the bog, with twigs chips, corn-stalks, coarse sods, garden rubbish, tan-bark and similar refractory materials.

The alkalies are useful also in correcting the sourness of crude peat, and by destroying the vitality of the seeds of weeds, the eggs of insects and the spores of fungi. The corrosive power of the caustic alkalies is too well known to need description. As relates to the material used for composts, it would appear that the alkalies unite chemically by preference with some of the constituents of the organic matter (such as peat or straw, for example), and in so doing disorganize the materials and destroy their coherence. But the matter thus crumbled, or made ready to crumble, is from the mere fact of its mechanical condition, peculiarly prone to decay, and there are reasons for believing that the presence of the alkali does also promote fermentation in the chemical sense. Dr. Angus Smith noticed long ago that if a soil is very alkaline and moist the conversion of the organic matter into ammonium compounds is very rapid. He put some soil not very rich in nitrogen into this condition by means of a little ammonia, so as to make it alkaline, and the consequence was the rapid occurrence of a very intense putrefactive fermentation, not in any way differing, as far as could be perceived, from that of ordinary putrefaction of animal and vegetable matter.

Excellent composts are still made, and they were formerly made more frequently than they are now, from wood-ashes and peat and from lime and peat; in many instances the lime was replaced with advantage by a mixture of lime and salt. Sometimes soda-ash was used and there is good reason to believe that, in default of wood-ashes, potashes would be found to be the most convenient of all the alkalies. Dr. Dana in his "Muck Manual," a book which had much influence in its day, specially commended the mixture of lime and salt and it has been largely used in many localities both North and South. It was urged a few years ago that salt should be admitted free of duty in order to encourage the growth of cotton.

Practical experience has shown very clearly that the mixture of lime and salt is better than lime by itself; that is to say, it exerts a more powerful alkaline action than lime alone and is a more efficient agent for disorganizing the crude peat. But it long remained a puzzle how this could be, for when solutions of lime-water and salt are mixed it is not found that

the presence of the salt increases in any way the alkalinity of the lime. The mystery was finally solved by the researches of Prof. Graham, of London, as has been explained by Prof. Johnson, in "Peat and its Uses." Thanks to the unequal rates at which the several chemical substances diffuse in presence of the porous peat, there is in the compost heap a reaction between the salt and the lime so that some caustic soda and carbonate of soda are really formed there. But these powerful and readily soluble soda compounds at once act upon the organic matter and corrode it more quickly than mere lime could do. There is an objection to the use of salt that the sodium compounds are not useful as plant food; and from this point of view it would perhaps be well to use a mixture of the German muriate of potash and lime for composting, instead of lime and salt. But there is another way of looking at the matter which is probably the best way; for, since the lime and salt mixture is simply despicable when considered chemically as a means of making caustic soda, it seems plain that if we wish to use caustic soda for making composts we had better buy it in the shops. But since caustic potash is distinctly better for compost making than caustic soda, inasmuch as potash is just as strong an alkali as soda and a true plant food into the bargain, the real moral of the use of lime and salt would seem to be that potashes and wood ashes are excellent materials for making composts and should be procured for this purpose.

There are some particular instances in which the use of alkalies in compost making is decidedly preferable to the use of dung. The composting of garden rubbish is a case in point. From the raking of garden beds and and walks great masses of rubbish are collected every year, consisting of sods, weeds, straw, leaves, lumps of loam, clods of manure and many other things which are commonly burned to the utter destruction of all the nitrogen which the matters contain. No doubt it is better in many cases to burn this rubbish rather than to have it thrown into the hog-pen or the barnyard, in view of all the weed seeds, insects and fungi which such matters harbor; and in general the burning of garden rubbish would be clearly justified if there were no other way of dealing with it. But in fact it might readily be treated with alkalies in such a way that all risk of injury from the seeds could be obviated while the organic matter would be converted into excellent manure. If such rubbish were once thoroughly moistened with dilute potash lye and thrown into tolerably large heaps, in a not too dry place, it would change to the condition of garden mold at the cost of little if any further manipulation. The same remark applies to weeds in general, and to the sweepings of hay-lofts. A thorough soaking in weak solution of potashes, or a generous admixture of fresh wood ashes and the subsequent moistening of the heap, would undoubtedly do the weed seeds such harm that they could never recover from it. When, as in this case, compost making is to be regarded as a device for cleaning the land, as well as for fertilizing it, some part of the cost of making the compost must, of course, be credited to the destruction of weeds. Another striking instance where alkali composts are in order is seen in the case of the Eel-grass (Zostera marina) which grows abundantly upon muddy bottoms in salt and brackish waters. This Eel-grass is a singularly indestructible kind of organic matter. It decays with extreme slowness in the barnyard or the hog-pen or when buried in the earth. But it may easily be decomposed by composting with quick-lime or any other strong alkali, and it is well worthy of such treatment since it contains one and one-third per cent. of nitrogen, one per cent. of potash and a quarter of a per cent. of phosphoric acid, besides lime and magnesia.

It may well be true that alkali-composts, such as have been described above, would be benefited if, after some months of decay and putrefaction, they were moistened with barnyard liquor, sewage, or night-soil for the purpose of introducing a supply of the peculiar ferment which causes nitrification and which is known to be present in decaying sewage, etc. Years ago when niter-beds were maintained in Europe for the purpose of making saltpeter, it was found best, when a new bed was established, to mix with it some earth from an old bed. We now believe that the old earth contained the ferment necessary for the process of nitrification, and it is plain that the compost maker may readily avail himself of this resource. In general, it may be well to purposely introduce the nitric ferment in this way to all compost heaps as soon as they have passed through the first hot fermentation or as soon as the original crude peat or other organic matter has become changed to the condition of true humus or vegetable mold. To this end it may perhaps be advisable to keep some old special heaps as reservoirs of the nitric ferment, for the express purpose of charging or "seeding" the newer heaps. By mixing some of the earth taken from these old heaps with the newer ones, the latter could be nitrified at will.

It is not impossible, indeed, that peat which has been well weathered by simple exposure to frost and air may be already fit for the nitric fermentation and that there is really no need of exciting in such peat the preliminary putrid fermentation. This is another point that deserves to be carefully studied. In this view of the matter, it may be asked, in cases where dung and weathered peat are composted, whether the chief use of the dung may not, after all, be to introduce the nitric ferment. At all events, the notion serves to enforce the fact that there are two distinct conceptions to be grasped by the compost maker:—I. He has to provide for the conversion of crude organic matters to mild humus, whether by the chemical action of alkalies or by hot fermentation, or by both; and II: he has to watch over the nitrification of the mild humus by the nitric ferment. If, perchance, the mere weathering of peat will do away with the need of taking the first step, that would be a decided gain in many cases; and the gain will be still greater if, as seems well-nigh certain, the second step can be taken methodically and intelligently. It may be asked also, in a somewhat different sense, whether it may not sometimes be advantageous to incorporate stable manure with alkali-composts tolerably soon after the establishment of the heap; that is to say after the alkali has been allowed sufficient time for its specific action. In this case the dung might perhaps help to cure the peat as well as to introduce the nitrifying germs. On the other hand, marl, leached ashes, or old mortar may be added with advantage to dung composts and to those made with potashes or soda-ash, for the sake of encouraging the growth of the nitric ferment.

Experiments, some of which were reported in the RURAL of March 13, have shown that the presence of carbonate of lime has a very favorable influence upon the prosperity of the nitric ferment, and it is well-known that the lime carbonate was considered to be an essential adjunct to the porous earth of the "saltpeter plantations" of former days. So, too, it has often been noticed that nitrates are especially apt to be formed in limestone caves and upon damp walls that are plastered with lime. It is doubtless by their influence at the nitrification stage that marl and leached ashes and the other forms of lime carbonate have approved themselves useful in compost making. Carbonate of lime can correct acidity it is true, and it would serve as well as any other alkali for treating those peats, occasionally met with, that are poisoned with sulphate of iron; but it has little power to corrode organic matter by mere force of alkalinity and should not be used for decomposing rough, crude materials such as are readily reduced by means of quick-lime or wood ashes. It is true that certain well-known experiments by Schulze have shown that vegetable mold kept moist and warm and exposed to the air, decomposes much more rapidly when mixed with carbonate of lime than when kept free from such admixture, but in the light of existing knowledge it appears that the observed rapid decomposition of the humus in presence of the lime carbonate was probably due to the activity of the nitric ferment and not to chemical corrosion.

One very effective method of making compost, and particularly of charging the compost with nitrates was described many years ago by Lorain. The idea is to maintain at a convenient distance from the kitchen sink, heaps of peat or other matters, including rubbish from the house and yard, and to lead to these heaps through a pipe or gutter all the suds and slop water of the house. Each of the heaps may be moistened in its turn by shifting a movable pipe, or a single heap may be built up gradually by throwing peat or loam upon it at intervals. It is plain that considerable quantities of excellent manure could be made in this way, and that the process might be made unobjectionable by taking care to throw earth upon the heaps often enough to avoid putrid emanations and offensive odors. If it were necessary, a trench or depression might be dug in which to place the heaps, in order that the slop water may flow freely to them. The method is akin to a plan sometimes adopted in Europe of establishing compost heaps at a point lower than the barn-yard so that the urine and dung liquor may occasionally be made to flow upon the heaps, to prevent them from becoming dry and to charge them with the nitric ferment. In this case, as in the other, care should be taken to run a furrow around the heaps to lead away any excess of rain water.

One reason why the reputation of peat composts has suffered in recent years is that, as commonly made, they are rather one-sided or "special" manures, not competent to compete with mixtures which contain all the elements of plant food. Peat compost prepared with dung, urine, fish, or flesh, is really little more than a nitrogenous fertilizer which, on most lands, would need to be supplemented with phosphatic and potassic manures, or perhaps even with lime, in order that the best powers of the compost may be felt, and that profitable crops may be grown by means of it. Composts prepared with potash compounds, or with lime, do, of course, contain, respectively, an abundance of potassic and calcareous plant food, but there is still a great deficiency of phosphates. This want may readily be made good by strewing spent bone-black from the sugar refineries, or even finely ground phosphate-rock, among the layers of dung and peat at the time when the compost heap is built. Thanks to the chemical action in the heap and to the carbonic acid which is freely generated there, enough of the phosphate will be corroded to make it useful as manure, at absolutely no expense to the farmer other than the first cost of the bone black and the trouble of strewing it on the peat. Several experiments in composting ground phosphate rock in this way have been made in Germany with good results.

It is not to be supposed that the phosphates thus composted are in any sense so quick of action as the phosphoric acid in superphosphate of lime or as that in bone meal, but the composted phosphate is undoubtedly well-suited for application to many grass lands and for other purposes where quick action is not required, and it is to be remembered that it costs comparatively little. A given amount of money expended in this way will fertilize with phosphoric acid a much larger area of land than could possibly be done by buying superphosphate or the like. There are times and places where the composted phosphate may be more fitly used than the more costly phosphatic manures, and it is the business of the farmer to recognize this truth and to govern his proceedings accordingly. It may be said in general that the composted phosphate will probably be found better for poor land and for fields incapable of repaying the application of more costly manure. It can hardly be of much use in high-farming, so called, but may nevertheless have real merit for promoting the growth of moderately good crops that are to be grown at very little cost, after the common American fashion. Like bone-meal, composted phosphate will doubtless be found not to do so good service upon dry land as upon that which is duly moist.

Another point to be mentioned in favor of composts is the power of making them far from home, for fertilizing outlying fields where peat or mud from marshes or ditches is obtainable. In this case the cost of transporting dung may be avoided by using either fish-scrap, the dried meat dust from slaughter-houses, potashes, wood ashes, or lime as the fermenting agent, care being taken to establish the heap in not too dry a position. A somewhat analogous device, formerly practiced in Massachusetts, was to haul a quantity of swamp mud in the Autumn or early Winter upon the fields where corn was to be grown next year and to haul out upon these fields next Spring from the barn-yard enough manure to ferment the peat. As soon as the weather permitted, the peat and dung were mixed, fermentation soon set in and the compost was ready for use at the time of corn planting.

Farm Topics.

COUNTRY LIFE.

Observations Among Rural Subscribers.

COL. F. D. CURTIS.

THE Curtis Homestead, now owned by L. D. Sherwood, is another example of the prudence and forethought of my father, who provided for the future by planting orchards to take the place of the old ones beginning to decay, and who increased his capital stock by investing his annual surpluses in the improvement of the farm. By this system of sound financial management he increased the value of the farm from $40 per acre, the purchase price, to $65, at which rate it was sold to Mr. Sherwood twenty years ago.

The farm embraces two varieties of soil—warm, gravelly loam, which gives crops an early start in the Spring, and a more compact and colder clay loam, which is natural for grass, and, being retentive of moisture, supplies fresh pasture in the drier portions of the Summer and is always sure to yield large crops of hay. The double character of the farm enables Mr. Sherwood to follow both grain raising and stock growing with profit, hence he unites these two branches of husbandry. His heavy soil is kept in permanent pastures and meadows, an arrangement which enables him by feeding the products to stock to make a large amount of manure. He has found that by liberal top-dressing he can maintain a meadow for a term of years, which would otherwise run out. He strengthens his meadows and adds to their permanence by allowing a growth of aftermath in the Autumn, which protects the roots so that there is less freezing and thawing and consequently less loss. The pastures are replenished yearly by the droppings of the animals, and by allowing the grass to start up before Winter the same beneficial results are obtained as with the aftermath in the meadows. In the rotation of the grain crops clover is an important factor, it being especially suited to the portions of the farm which are more specially utilized in grain raising. Clover starts early in the season on these lands and consequently can be cut in mid-summer, leaving the balance of the season for a second growth, which, with the liberal manuring Mr. Sherwood gives his fields, makes a large growth and supplies late feed in the Autumn, while the meadows and pastures are clothing themselves with their Winter protection.

Like other farmers who have been trained in the old school, Mr. Sherwood has no specialties unless it is his corn field. The gravelly soil is natural to corn, and the owner of these choice lands knows just how to manipulate them for the production of a large crop. In his rotation of crops he has a clover field every year to be turned over for corn. He plows his manure under, not because this is always the best way, but because he was brought up to do so and because he invariably has good crops under this system.

There is sound philosophy embodied in it. He plows his corn ground in the Spring, turning under the clover roots and vegetable matter on the surface, which, together with the manure, form an active stimulant by the processes of decay, and at the same time, owing to the variety of vegetation and salts contained in them, the clover stems, leaves and roots, and the manure brought from the barnyard, create a permanent food for the growing corn. Mixing a variety of manure is an excellent idea, as it insures active decomposition and is certain to supply the needful wants of the plants.
